Section on Orthopedic Surgery: Drs. R. K. Ghormley and M. B. Coventry, Rochester, "Degenerative and Pathologic Changes in Lumbosacral Intervertebral Disks."

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is Dr. F. I. Moersch, Rochester; from the Section on Dermatology and Syphilology, Dr. Hamilton Montgomery, Rochester.

* * *

The Connecticut State Medical Society celebrated its 150th anniversary meeting at Middletown, Connecticut, on June 3 and 4, 1942. It was here that on October 9, 1792, thirty-six practitioners of medicine of the State of Connecticut gathered at the Court House for the first meeting of the society. The society was the fourth state medical society to be established in America and is the third to have had continuous existence since its founding. It is interesting to note that all but two of the first names of the founders from Elnathan Beach to Jeremiah West, were names taken from the Bible.

HOSPITAL NOTES

A \$1,500 addition is being constructed on the Mound Park Hospital in Saint Paul. Miss Mary Danielson is superintendent.

* * *

The resignation of Bernard S. Andrus of South Saint Paul as a member of the board of the Mineral Spring Sanatorium at Cannon Falls, has been accepted by the commissioners of Dakota County. Herbert Swanson has been appointed to succeed him.

* * *

A course for nurses in emergency hospital procedure was given at the University of Minnesota Center for Continuation Study, June 3, 4 and 5.

* * *

National Hospital Day, May 12, celebrated on the 122nd anniversary of the birth of Florence Nightingale had added significance at Saint Barnabas Hospital in Minneapolis this year. It was the occasion of the dedication of the new children's unit. Open house was held

* * *

At the annual meeting of the Winona (Minnesota) General Hospital Association, L. A. Geise and J. A. Henderson were elected members of the association, group of sixteen in whom title to the community institution rests. They succeed Dr. G. J. Tweedy, resigned, and the late S. L. Prentiss.

L. H. Bailey was reelected president; H. R. Wicking, vice president; H. K. Brehmer, secretary. J. F. McConnon was named treasurer.

George M. Edblom, superintendent, reported that hospital service was provided 3,270 patients during the year ending May 1.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

ANNE MEDICAL LECTURES—The Lymphatic System. Its Part in Regulating Composition and Volume of Tissue Fluid. By Cecil K. Drinker, Professor of Physiology and Dean of the School of Public Health, Harvard University. 101 pages. Illus. Price, \$2.35 cloth, \$1.50 paper cover. Stanford University, Calif.: Stanford University Press, 1942.

EPHRITIS. Leopold Lichtwitz, M.D. Chief of Medical Division of the Montefiore Hospital, Clinical Professor of Medicine, Columbia University, New York. 328 pages. Illus. Price, \$5.50 cloth. New York: Grune & Stratton, 1942.

THE MANIFESTATIONS OF INTERNAL DISEASES. I. S. Tassman, M.D., Associate Professor of Ophthalmology. Graduate School of Medicine, University of Pennsylvania, Philadelphia, Attending Surgeon, Wills Hospital, Philadelphia. 542 pages. Illus. Price, \$9.50, cloth. St. Louis: C. V. Mosby Co., 1942.

MANAGEMENT OF THE SICK INFANT AND CHILD. Sixth Revised Edition. Langley Porter, B.S., M.D., M.R.C.S. (Eng.), L.R.C.P. NATIONAL FORMULARY, Seventh Edition. Completely revised and considerably enlarged. American Pharmaceutical Association. Price \$6.00. Easton, Pennsylvania: The Mack Printing Company, 1942.

Included among the new monographs in N.F. VII are Ammoniacal Solution of Silver Nitrate and Zinc-Eugenol Cement, two important dental preparations; and Cherry Juice and Raspberry Juice to provide a convenient method of preparing the official Syrups and making it possible for pharmacists to prepare them at any time of the year instead of merely during the fresh fruit season as was the case formerly when the syrups were prepared from the fruit. Preparations of the disodium salt of 2, 7-dibrom-4-hydroxymercurifluorescein, introduced under the proprietary name "Mercurochrome," are admitted to the new N.F. under the title "Merbromin."

Neocalamine, a new form of calamine which more nearly approximates flesh color, is included and formulas are provided for a lotion, phenolated lotion, and ointment of this drug. These new preparations are much more agreeable to use than those made with calamine and in time will probably completely replace them.

An important feature of the new Edition is a greatly augmented section devoted to materials and preparations for use in the Clinical Laboratory. Pharmacists will find this section a comprehensive guide to the reagents ordinarily used by the Clinical Laboratory and by the physician who does laboratory examination in his office.

Seventy-one articles, official in U.S.P. XI but not admitted to U.S.P. XII, have been added to the N.F. in order to provide standards of purity, quality, and strength necessary to their use.

Publication of the Seventh Edition of the National Formulary marks the first step in the continuous Revision program which has been adopted by the American Pharmaceutical Association in order to keep the compendium up to date with advances in pharmacy and medicine.

AMERICAN FOUNDATIONS AND THEIR FIELDS. 5th revised edition. Compiled by Genevieve Seybold. 274 pages, 12 tables, \$5.00, cloth. New York City: Raymond Rich Associates, 1942.

This volume is a comprehensive study of American foundations and family trusts which have made grants to outside agencies and individuals. It brings up to date the survey of the same title published in 1939 by Raymond Rich Associates, and earlier editions issued by the Twentieth Century Fund.

Primarily a reference handbook, it presents basic data, listing the chief foundations, reporting their capital assets, and analyzing the purposes for which they spend their incomes. All data have been checked and authorized by responsible foundation executives.

A convenient directory section gives the names and addresses of 314 foundations, including 9 reported for the first time, the names of their officers and trustees, the purposes for which the foundations were set

o, the year established, the methods of operation, the foundations' direct activities, their total capital assets, their total expenditures and their total grants for the year 1940.

The specific grants made by the foundations, totaling payments of nearly \$40,400,000 in 1940, are classified according to the fields in which the appropriations were made. The survey shows that Medicine and Public Health continue to rank first, although Education ranks a close second, and Social Welfare third, among the fields supported by foundations. Comparative figures showing the grants in various fields for the years 1934, 1937 and 1940 indicate highly interesting trends in the flow of foundation funds.

Other illuminating tables show the growth of the capital assets of individual foundations since 1934, until 1940 a total capitalization of \$1,073,572,367 was reported by 162 foundations.

Those who have the responsibility of investing college endowments or other large sums for philanthropic purposes will find of particular value an analysis of foundation investments, with amounts given in both dollars and in percentages of the total investments. A new feature of this edition is a comparison of foundation investment portfolios for 1937 and 1940.

Another new feature is a survey of support available for education through student loan funds. The thirty-two funds under survey made loans totaling \$1,588,740 during 1940 applicable to tuition in more than one institution.

The volume, a compact library of information concerning foundation activity, provided by the foundations themselves, brings together much scattered data and also presents a considerable body of useful material that is available in no other form.

DIRECTORY OF MEDICAL SPECIALISTS. Certified by American Boards. Pages: xvi + 2,495. Price: \$7.00. New York: Columbia University Press, 1942.

Since the first edition of the "Directory of Medical Specialists" appeared, more than four thousand doctors have taken their Board examinations. This second edition, therefore, contains complete information about more than eighteen thousand certified Diplomates. And not only is the book larger by that many new diplomates, but also the information about each doctor more complete than it was before.

This book is not only a directory to medical specialty but is also an index to a trend in medical development—one which has grown more than twenty-five per cent in the last two years. Needless to say, the value of this book to a nation at war is tremendous. To Washington officials, to army and navy administrators, as well as to local and regional selective service executives, the "Directory of Medical Specialists" is becoming increasingly useful.

A separate section is devoted to each American board, with both a geographic and a biographic listing of its Diplomates. In addition, there is a complete alphabetic list of all the Diplomates. In this list there

Don't Wait Too Long

Illustrated, a handy model for your desk. Approximately 8 inches in diameter and 9 inches high.

\$10.95

BROWN & DAY, INC.

62-64 East 5th Street

St. Paul, Minn.

It's time to think of hot weather and fans once more. This year try one of the modern **KISCO CIRCULAR** units, and you'll be glad your old fan is worn out.

These clever fans lift the cooler air up and distribute it in all directions at one time.

And don't wait too long—as you know—deliveries are pretty irregular these days.

are addresses and indications of specialty certification while in the geographic section complete biographic information is given. The organization and examination requirements of each of the American Boards are explained in full.

All these features make the Directory unique and invaluable to doctors (specialists or general practitioners), hospitals, social agencies, libraries, medical societies, business organizations, etc. It will help hospital officials pass on the ability of candidates for positions. It will provide medical society officers with authoritative lists. Family physicians can form accurate judgment of the qualifications and ability of specialists in any branch of medicine for the benefit of patients. In short, it has so many practical uses that it is certain to be an indispensable reference tool for thousands of individuals and organizations.

LITTLE WHITE LIES

The prime dilemma through all medical history has been whether to tell the truth to a fatally ill patient.

There are those who believe that no good ever comes out of deception; that it is more honest and more humane in the long run to tell a patient that he is the victim of an incurable or inevitably fatal disease. There are those who say that such a practice is not only cruel but inaccurate, since tomorrow some new remedy may come into our ken which will make a former hopeless disorder treatable.

Patients themselves usually say: "Tell me the truth, Doctor, I'd rather know, and I can take it." It is doubtful, however, whether even the sturdiest wants to have a death warrant read to him.

This much seems incontrovertible: the physician who discovers or diagnoses a hopeless ailment must transmit that information to some responsible member of the family. To tell the patient that he is doomed to an early death, however, seems pointless, for it is impossible to see any good that could come out of such a procedure except in a small group of cases in which rearrangement of a man's business affairs might make for financial security in his family. Even in these cases it would seem sufficient to tell the patient that he would be too sick to carry on his business for a long time and that he should adjust his affairs accordingly.

To transmit a verdict of inevitable death under any other circumstances, however, appears utterly without justification except perhaps the abstract one of rigid truthfulness, no matter what the cost. Since the emotional state of the patient is so large a factor and since the hopelessly sick patient has so few comforts, there would appear to be no justification for taking from the tiny reservoir still available, that one last blessing—Pandora's Box.—*The Journal of the Medical Society of New Jersey*, October, 1941.

CASE HISTORY No. 104

ASTHMA and PERENNIAL HAY FEVER

Miss I. M. —. Symptoms: Asthma and Perennial Hay Fever. Patch tests revealed sensitivity to Ragweed Giant, Ragweed Short, all Feathers and Orris Root (last named contained in cosmetics used by patient). Complete relief of Asthma and sneezing after perennial treatment and discontinuance of former cosmetics. Subsequent regime of AR-EX Cosmetics brought no recurrence of conditions.

Prescribe AR-EX Cosmetics whenever patient care requires beauty aids free from allergens and irritants.

FOR NERVOUS DISORDERS

Operated In Connection

with

Homewood Hospital

Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.

When you record the effectiveness of *NICOTINE CONTROL* —less nicotine in the smoke

IN recent months we have received a number of reports from physicians who recommend Camels to their patients. Perhaps you, too, advise Camels

in cases where nicotine reduction is desirable. If so, we will be pleased to add your experiences to our files. May we hear from you from time to time?

Scientific facts indicate that:

1. Slow burning produces less nicotine in the smoke of cigarettes.*
2. Increases of as little as 25% in nicotine intake produce profound physiological changes.**
3. The smoke of slow-burning Camels contained less nicotine than that of the 4 other largest-selling brands tested—less than any of them—according to independent scientific tests of the

smoke itself! In the same tests, Camel burned slower than any of the 4 other largest-selling brands tested.***

In mild depressions

With patients suffering from mild depressions, there is ample evidence in the literature that Benzedrine Sulfate therapy will often produce some or all of the following effects:

- (A) *Increased mental activity, interest and accessibility.*
- (B) *Increased self-assurance, optimism and sense of well-being.*
- (C) *Psychomotor stimulation; increased capacity for physical and mental effort.*

Benzedrine Sulfate Tablets

Brand of amphetamine sulfate

Benzedrine Sulfate is primarily useful in depressions characterized by apathy and psychomotor retardation, but is contraindicated in patients manifesting anxiety, hyperexcitability, or restlessness.

The use of Benzedrine Sulfate by normals should not be permitted; it should always be administered under the careful supervision of a physician; and depressive psychopathic cases should be institutionalized.

In treating depressed patients with Benzedrine Sulfate, the physician should bear in mind that any drug which produces pleasant or euphoric effects may prove to be habit forming—especially in unstable or neurotic individuals.

Smith, Kline & French Laboratories, Philadelphia, Pa.

Take no one's word but your own

*as to the advantages of any one cigarette for patients
with irritation of the upper respiratory tract due to smoking*

THE published studies on cigarette differences are merely a starting point. It is only when doctors make their *own* tests . . . on their *own* patients who smoke . . . that they are fully convinced of PHILIP MORRIS superiority.

That is why we suggest that *you* try PHILIP MORRIS on *your* patients. Your findings will confirm the published studies* which showed that:

**ON CHANGING TO PHILIP MORRIS
CIGARETTES, EVERY CASE OF IRRITATION OF THE NOSE AND THROAT
DUE TO SMOKING CLEARED COMPLETELY OR DEFINITELY IMPROVED.**

*stimulation
of labor*

STARTING FROM SNUFF

Since the first recorded statement on stimulation of contractions of labor by means of snuff, as advised by Celsus about 25 A. D., the oxytocics used have been many and varied. The advent of Pitocin* in 1928 provided the obstetrician with an oxytocic of unusual scope and notable advantages.

Pitocin consists of the oxytocic principle of the posterior pituitary gland with practically none of its pressor principle. Therefore, it causes no appreciable rise in blood pressure. A favorite preparation for stimulation of the uterine musculature in uncomplicated obstetrics, Pitocin has special advantages in eclampsia, hypertension, and nephritis.

The purity of Pitocin and its exceedingly low protein content minimize the possibility of reactions. From the angle of uniformity, potency standardization — in every way — Pitocin is the No. 1 pituitary oxytocic.

Pitocin (alpha-hypophamine) finds wide use for: medical induction of labor, stimulation of the uterus, in properly selected cases, during labor, and prevention or control of postpartum hemorrhage.

OVER 75 YEARS OF SERVICE
TO MEDICINE AND PHARMACY

PICTURE OF A PHYSICIAN

with a little time to himself!

You're right! Something should be done these days to give physicians more time for themselves . . . and S-M-A* Infant feeding formula is helping to do it!

Take the case of the physician whose patients kept calling up to discuss "Formula Troubles." He decided to save time by prescribing S-M-A for normal infants deprived of breast milk. Don't take our word for it—in a recent survey among 3935 physicians who fed S-M-A, 76% of those reporting said S-M-A saved time; 89% of those reporting said S-M-A was easier for mothers to prepare; 85% of those reporting said with S-M-A they observed freedom from digestive upsets.

*S-M-A, a trade mark of S.M.A. Corporation, for its brand of food especially prepared for infant feeding—derived from tuberculin-tested cow's milk, the fat of which is replaced by animal and vegetable fats, including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and physical properties.

'Soup Kitchen' for Bacteria

BACTERIA AND THEIR FELLOW TRAVELERS, the viruses, are epicures of the first order. Deny them the right ration and they refuse to go on living in the laboratory. Some subsist on daily dishes of milk and potatoes, while others thrive on beef tea and special mixtures of agar, gelatin and animal juices. The pneumococcus, a finicky fellow, must be fed the heart of the beef for the greatest proliferation. And we could go on citing many more cases of how science has satisfied their appetites.

A quarter of a million pounds of meat were consumed by bacteria at Lederle last year. Add to this a yearly consumption of two and a half million liters of agar solution, not to mention volumes and volumes of other culture media, and you have, we believe, the world's largest "soup kitchen" for bacteria. Here they are cultured under scientific control, allowed to thrive and then put to use for man's benefit.

Propagation of micro-organisms and viruses is a major feature of the art of biological production. At Lederle this important phase is under the direction of a staff of skilled bacteriologists, long experienced in making superior serums, anti-toxins, vaccines and toxoids for the prevention and treatment of diseases of man and animals.

War Paint

In the midst of the blitz in England a lipstick became a symbol of democracy, bravely worn in defiance of that "wicked man's" attempt to shatter morale. Early in the history of the U. S. S. R. women protested against a ban on cosmetics, and it was lifted. These things are easy to understand when one reflects that cosmetics are an intimate part of a woman's life. They are essential to her well-being, her sense of personal fitness. When a woman knows she looks pretty she can face almost any situation with equanimity and courage. She needs her "war paint"; it bolsters her morale.

During the telling months ahead our industry may be deprived of certain raw materials. Packages and containers may have to be changed. Any great emergency is a test of resourcefulness. We believe that our industry will not be found lacking in that sterling American quality. Our research facilities are directed towards finding alternative raw materials that will be at least as satisfactory as those they replace. Come what may, we'll do our best to continue to supply American women with those aids to good grooming, those props to personality, that in their modest way contribute so much to national morale.

G-E X-RAY SERVICE

SPANS THE COUNTRY—

IT might surprise you to know that an x-ray unit . . . such as the KX-8-33 with centralinear control...contains nearly 12,000 parts.

These parts are so durable and well-fitted in any General Electric unit that most of them function for the life of the equipment with but little attention. However, since anything mechanical requires some care, G-E accepts the responsibility to provide service based on complete knowledge of the whole unit.

To do this, G-E maintains branch offices and regional service depots throughout the country, with factory-trained representatives who are ever ready to help you keep the equipment at its highest opera-

ting efficiency. These field men study all the new engineering principles, the latest "wrinkles" in service techniques, and keep up to date on the proper care of mechanical features . . . an important safeguard for the satisfaction you desire from an x-ray unit.

Step to the telephone today...or any day . . . and give the nearest G-E representative listed on this page a ring. You will find him highly competent in helping you select the electromedical equipment best suited to your practice.

THE ART OF DOING THINGS WELL

WITH THE first microscope Leeuwenhoek saw objects magnified 200 to 300 times life-size. The familiar microscope of medical school and laboratory shows images that are, at most, 2,000 times larger than life. Now comes the electron microscope with direct magnifications of 10,000 to 30,000 times making possible clear photographic enlargements to 200,000 times life-size. There is no fine background of experience with the electron microscope, for with it objects are seen that are but a fiftieth the size of the smallest heretofore visible. But the background will be filled in as new facts are uncovered to aid in treating disease. Just now the electron microscope is contributing to the art of doing things well in research.

Volume 25 July, 1942 No. 7

THE ORGANIZATION AND FUNCTIONS OF THE MEDICAL DEPARTMENT OF THE UNITED STATES NAVY

CAPTAIN FREDERICK R. HOOK (MC) U.S.N.
Washington, D. C.

ALL activities of the Medical Department of the Navy come under the direct supervision of the Bureau of Medicine and Surgery, which was established by law in 1842. The activities of the Bureau are organized along functional lines, to include eleven divisions. These are:

1. The Division of Administration.
2. The Division of Personnel.
3. The Division of Dentistry.
4. The Division of Physical Qualifications.
5. The Division of Preventive Medicine.
6. The Division of Aviation Medicine.
7. The Division of Matériel and Finance.
8. The Division of Inspections.
9. The Division of Planning.
10. The Division of Publications.
11. The Division of Red Cross and Veterans' Administration.

To make any attempt to discuss the setup of these divisions would be entirely too time-consuming, and I am afraid uninteresting. I shall limit my remarks chiefly to the problems of personnel, and to our plans for the care of battle casualties.

Briefly, the functions of the Naval Medical Corps can be listed under four headings:

1. The proper selection of personnel.
2. The care of the sick and injured.
3. The maintenance of physical fitness of our entire personnel.
4. The elimination from the Service of the unfit by retirement or by medical discharge.

The Navy is made up of the Fleet with its sup-

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.

JULY, 1942

porting bases. It takes years to build a battleship and months for the smaller ships. This gives us a chance to plan ahead, and to build up personnel against the day of commissioning. Modern navies consist of many different types of ships. With the time at hand, it would be impossible to dwell at any length upon the individual functions of the medical personnel of these various units. We know, however, that the mutual support of these various highly specialized units is of the greatest importance in battle, and that the highly differentiated functions of a modern naval medical service indicate that the duties of the medical officer on recruiting duty, in the laboratory, in the surgical operating theater, in the field, afloat, in the diving unit, and in the air, all converge toward the same objective, that of maintaining a readiness for wartime conditions.

The policy of our country in the past has been to maintain a small standing Army and Navy; therefore, when a national emergency arises, our armed forces merely serve as a nucleus around which a much larger number of civilians and reserves crystalize. For this reason it is fitting that the regular service medical officer, particularly in the latter half of his career, should develop a well grounded knowledge in military medicine. When war comes he must be prepared to surrender his purely professional duties to an equally competent, available reserve officer, and assume duties requiring long military experience.

The onset of our present building program found us with 875 regular medical officers on active duty. This was somewhat under our allowance, which is six and one-half medical officers

per thousand of enlisted and officer personnel in the Navy and Marine Corps. With the rapid shore expansion and commissioning of new ships, it soon became necessary to call to active duty, members of our reserve force, which had been built up through the foresight of our policymakers during the past few years. At the present time there are more than 3,000 regular and reserve medical officers on active duty with the Fleet and on Shore Stations. Should recruiting continue at its present rate, it will be necessary to more than double this number by the end of the year.

Doctors may obtain commissions in the regular service in two ways: (1) graduates of Class "A" Schools who have had an internship of one year may be commissioned as Junior Grade Lieutenants, providing they meet the physical requirements and pass the professional examinations; (2) recent graduates of Class "A" Schools may be appointed as Acting Assistant Surgeons and after serving a year's internship in a Naval Hospital then be commissioned as a Junior Grade Lieutenant.

The Medical Corps of the Naval Reserve consists of two classes: (1) the Volunteer General Service Class MC-V(G); and (2) the Volunteer Special Service Class MC-V(S). The physical requirements for appointment in the General Service Class are the same as in the Medical Corps of the Regular Service except that the age limit is thirty-five instead of thirty-two as in the Regular Service. The maximum age limit for appointment in the Special Service Class is fifty years. Officers in this class are not required to pass such a rigid physical examination and are recruited for shore or hospital ship duty only.

The rank a candidate obtains upon entering the Reserve force depends chiefly upon his age and professional qualifications.

The staffs of our naval hospitals are now made up chiefly of reserves. Knowing of the great sacrifices that many of these officers are making in abandoning their civilian work, it has been a revelation to us in the regular service to see with what enthusiasm they have turned to on their military duties. Their zeal and industry has brought new and refreshing blood to our ranks.

In addition to the medical reserve officers in the General and Specialists classes, we also have 111 Medical Specialists Units. Each of these units consists of eight medical and one dental officer.

The specialties represented are: general surgery, orthopedic surgery; internal medicine; psychiatry; urology; otolaryngology; roentgenology; and prosthodontia. These units are the nuclei for assignments to naval hospitals, hospital ships and other medical department activities, requiring a complete medical corps organization. Practically all of them have been called to active duty since the onset of the national emergency. Many of these units were organized at teaching centers throughout the country, and several of the principals are key members of medical school faculties. The Bureau appreciates the need for a continuous flow of medical school graduates, and intends to disrupt teaching activities as little as possible; for this reason each principal member has an alternate, who, at the time of mobilization, proceeds with his unit, if for any reason the principal cannot go.

It is estimated that in addition to the specialists in the various branches now on active duty, the following number will be necessary to care for the Navy's needs:

Allergists	34
Anesthetists	85
Cardiologists	40
Clinical Pathologists	125
Dermatologists and Syphilologists	180
Gastro-enterologists	30
General Operating Surgeons	500
General Operating Surgeons Assistants....	150
Internists	550
Pediatricians	175
Neurologists, Psychiatrists	125
Obstetricians and Gynecologists	125
Neurosurgeons	100
Radiologists	125
Ophthalmologists	50
Ophthalmoto-otolaryngologists	200
Orthopedic Surgeons	175
Maxillo-facial Plastic Surgeons	40
Thoracic Surgeons	50
Tuberculosis Specialists	45
Urologists	100
Public Health Specialists	32
Flight Surgeons	120
Aviation Medical Examiners	91
Tropical Medicine Specialists	20
Deep Sea Diving Specialists	32

The rapid expansion of the Navy has also produced a great need for enlisted medical personnel. It has been the policy of the Navy in the past to allow men to transfer voluntarily, to the Fleet Naval Reserve Force after sixteen to twenty years of service. The services of these men on re-call to active duty have been invaluable. By increasing the number and capacity of our Hospital Corps Schools we have been able to produce a sufficient number of non-technical hospital corps-

men for ordinary duties. There has been, however, insufficient time to train men in the highly technical ratings, so again we have had to turn to our civilian friends for their x-ray technicians, dental mechanics, laboratory technicians, basal metabolic technicians, male nurses from psychiatric institutions, embalmers, et cetera.

The fire power of a ship, to a great extent, determines its fighting ability. A ship to be 100 per cent efficient must have a mentally and physically fit crew, as nothing disrupts organization aboard ship more than men on the sick list. Months are required to develop a well trained crew; a gun's crew presents teamwork at its highest state of efficiency, every man being a specialist in his assigned task. With this in mind, psychiatrists and psychologists are on duty at naval training stations to weed out the mentally unfit. Knowing that physical examinations alone frequently fail to reveal incipient and arrested pulmonary tuberculosis, we are now x-raying the chests of all recruits upon their arrival at the training stations. This is done with 35 mm. films. All of our naval personnel has now been actively immunized against tetanus by the use of tetanus toxoid. Yellow fever and typhoid fever immunizations have also been completed. Recent research work done by our epidemiologic units at naval training stations shows that, contrary to the generally accepted belief, a large percentage of recruits are susceptible to diphtheria. If further work along these lines substantiates these findings, it is probable that all Schick positive men will be actively immunized against diphtheria.

Hospital expansion in the Navy has kept apace of the personnel growth, so that now we have over 20,000 beds available. This number will continue to increase as present building and proposed units are completed. Modern warfare calls for mobility, and for this reason mobile base hospitals have been devised. These are 500-bed units, several of which have already been organized. Two of these are now functioning on our island bases. The first of these units assembled was set up on an island base where it functioned for several months; it was then dismantled, packed, and transported to another island base, a distance of 900 miles, where it was reassembled and resumed functioning within a few weeks. Strictly speaking, this is not a mobile hospital, but it probably approaches mobility about as near as any self-supporting base hospital can. We

have our smaller well equipped field hospital units which accompany our field forces; these are entirely mobile.

The geographical distribution of our forces takes them to all extremes of temperature and climate. Excellent courses in tropical medicine have always been a part of the curriculum at the Naval Medical School, and many of our medical officers have had duty on tropical stations, so we have little to fear from this angle. Our experience in the colder climates, however, is less extensive. There are many things that we must learn in regard to clothing, food, housing, et cetera. We must find a way to maintain the efficiency of our personnel in subzero weather. We are also mindful of the questions of sanitation and preventive medicine in our new bases, and are indebted to the Public Health Service for the aid they are giving us along these lines.

Ventilation aboard ship has been, and continues to be the basis of a great deal of study. Air conditioning ashore is a fairly simple matter, but aboard ship the equipment is costly and bulky; so far it has not been entirely satisfactory. Unless fresh air can be furnished to the crew at their fighting stations and in their living quarters, their efficiency is bound to suffer.

The medical department has had its share in developing diving to its present state of efficiency, so that now dives of more than 400 feet are made, and work by divers accomplished beyond 300 feet. The experience gained in this subsurface work is now being put to use in attempting to solve the problem of how to keep our pilots functioning efficiently at the other extreme, i.e., above an altitude of 37,000 feet.

In connection with the Army, the American Red Cross, the Medical Division of the National Research Council, and civilian groups, much research work has been done on the preparation of blood plasma. This has resulted in standardization of preparing and packaging of dried plasma. This plasma will be available for use on all ships.

The anesthesia problem aboard ship is a rather perplexing one. Spinal and local anesthesia have long been favorites of the naval surgeon, due to the fact that he seldom has a trained anesthetist to rely upon. During peacetime when the ship is open and ventilation is adequate, ether has been used freely, but working under battle conditions with compartments closed up tightly, ether or any of the explosive gases would be extremely dan-

gerous to use. For this reason, operations that cannot be done under local, spinal, or intravenous anesthesia, will probably require the use of chloroform.

Medical Tactics—Battleships are heavy and comparatively slow. They are built to take punishment as well as to deal it out. A ship to be able to fight must first be able to float, and for this reason Naval Architecture has developed an extensive system of compartmentation which has greatly increased the floatability of these ships. This was well demonstrated in the Bismarck which, after having been crippled by aerial torpedoes, took an unbelievable amount of punishment before she could be sunk by gunfire. In battle, water tight integrity of compartments is of the greatest importance. In the past few years we have heard a great deal about damage control aboard combatant ships. With it have come drastic changes in the arrangement of the medical department for battle, and its function during action. The care of casualties during battle must be considered as a phase of damage control, for matériel damage and personnel damage go hand in hand.

Consistent with the importance of damage control on combatant ships, two fundamental principles are enunciated:

1. The water-tight integrity of the ship, regardless of the wounded, must be preserved.
2. Fire-power, as delivered by the batteries of the ship, regardless of the wounded, must be maintained.

The medical personnel aboard a capital ship in wartime consists of three medical officers and one dental officer. There is also one hospital corpsman for each hundred of the ship's company. With a wartime complement of 1,800 to 2,000 men there will be 18 to 20 hospital corpsmen aboard. This number will not afford a skilled medical attendant for each compartment. In men-of-war only the vulnerable and fighting parts of the ship are protected by heavy armor; this does not include the sick bay, which is above the water line, and therefore not protected by side armor. Under battle conditions this station must be abandoned.

To insure the services of medical personnel after action, and to conserve the medical and surgical supplies and equipment, it is necessary that

they be distributed in two or more protected areas behind armor. All compartments being tightly closed during battle conditions, relative immobility is imposed upon all personnel. This time is utilized to prepare matériel and equipment for the post battle rush and to drill hospital corpsmen in their duties. In our peacetime drills we try to conceive of every possible type of damage that the ship and its personnel might suffer. It is not difficult to simulate many of the states of matériel damage to the ship and its equipment. We cannot, however, produce mutilating wounds, severe states of shock, burns, et cetera, just for training purposes and, therefore, feel that the physical standards and professional qualifications of our medical personnel, both commissioned and enlisted, must be maintained at a high level if our wounded are to be assured of the best possible treatment.

The inability of medical personnel to get to the wounded at their battle stations makes it necessary that all members of the crew be instructed in first aid measures. Men are taught to apply occlusive dressings properly, to apply a tourniquet to a leg or arm, to apply a dressing to a burn, to recognize the need for immobilization of a fracture and the care in moving men with fractures. They are also taught to relieve suffering by the use of morphine supplied in syrettes. Many of you will raise an objection to putting this potent drug in the hands of laymen. If the wounded are to get relief from pain early there is no other alternative, as it may be hours before they can be reached by a member of the medical department.

Prior to battle, first aid material in metal boxes is distributed to every vulnerable part of the ship, where it will be available for self or mutual aid. The supplies depend upon the number of men in the compartment, the hazards of the position, and the type of casualties anticipated. In the turrets and other large compartments where accidents are apt to occur, selected lay members of the crew are especially trained in first aid measures, and it becomes their duty to direct the handling of the casualties. Two per cent of the ship's crew is instructed in transportation of the wounded; these men are usually the ship's bandsmen and they make up what is known as the ambulance party.

During action aboard a combatant ship all watertight doors and hatches are controlled by

central station. When matériel damage occurs in any part of the ship, and it is possible to modify this tightly closed condition of the ship, repair parties move to make such repairs as are possible. Accompanying each of these repair parties are one or more hospital corpsmen, and stretcher bearers. These men give what aid they can and when possible move the wounded to or toward the battle dressing station.

The maneuvering and preparation of a Fleet for battle may take hours or days; the battle itself seldom lasts more than a few minutes. The constant menace from submarines and from the air, however, keeps the ships in a state of perpetual readiness for battle. Immediately upon cessation of battle or during a lull in action, the medical department has its greatest opportunity to contribute directly to the military efficiency of the ship. This is done by:

1. Restoring to fighting efficiency the wounded men made ill by prevailing battle conditions, and those incapacitated by the milder effects of chemical agents. These will find their way by designated routes to the proper dressing stations.
2. Clearing the gun and other battle stations of the more seriously wounded. These must be helped or carried to the dressing or chemical decontamination stations.
3. Treating those whose injuries incapacitate them for duty.

It is of the greatest military and humanitarian importance that all severe battle casualties be removed from fighting ships at the earliest possible time. Upon cessation of hostilities, stretcher parties are sent out to all parts of the ship, and the wounded brought into the battle dressing stations where they are sorted out. Dressings are adjusted and wounds examined for hemorrhage. If tourniquets have been applied they are removed and active bleeding controlled by compression or by tying off the bleeding vessel. Prophylactic shock treatment is instituted by giving hot drinks, food, and morphine. Fractures are splinted and prepared for transportation. If shock is present, blood plasma transfusions are given and the patient is not evacuated until this condition is well under control. Chemotherapy is instituted at this station, and casualties are classified as to the priority of evacuation. Major oper-

ations that can be deferred with safety are not done at the dressing stations aboard combatant ships, but await more favorable conditions in a hospital ship or shore station. It is, however, not only possible, but probable, that owing to the lack of supporting hospital facilities, definitive treatment of the wounded must be undertaken aboard combatant ships, and for this reason, equipment and matériel are always at hand, and peacetime training of personnel always embraces this possibility. With this in mind, one of the medical officers assigned to each capital ship is a qualified surgeon.

Wounds of naval warfare are characterized by their great extent, their multiplicity, and the frequency with which secondary as well as primary missiles and pieces of clothing are driven into the tissues; sepsis may be expected in all of them. Burns have always been common, but are even more frequently seen in this modern type of warfare. They are due to blasts from exploding shells and bombs, burning powder, cordite, or fuel oil. A bomb exploding in a compartment below decks will set up a blast wave, which in its search for an exit, will proceed along passageways and air ducts, and may cause burns at some distant part of the ship. The lightest type of clothing will protect against these waves. Flash helmets and gloves made of light material will also protect the face and hands.

New weapons of destruction are constantly being developed which call for newer methods of prevention of casualties. The efficiency of aircraft has made it necessary to build heavier armor in decks of capital ships, and to provide more protection for gun's crews on the upper decks. Bombs missing ships but falling in the immediate vicinity, explode with such violence that glass in port holes is shattered with resulting casualties in the compartments. This means that new ships must be built without portholes, and those in the older ships blocked out. Mines exploding beneath ships, and bombs or torpedoes exploding below decks, cause such a violent upheaval of that part of the ship, that not only are men's feet and legs fractured, but the upward thrust against the deck overhead also produces severe intracranial damage. For this reason men not actually at work should spend as much time as possible in the reclining position rather than sitting or standing.

In battle, the casualty list of a man-of-war may

be comparable to that of a regiment during a hard drive. The medical department of the ship must be entirely self-sufficient. A six months' supply of medical and surgical stores are aboard at all times. Light armored forces, destroyers, submarines, and cruisers are likely to be sunk or escape with little damage. Air force casualties may be heavy, but they will require little treatment or evacuation. The same can be said for submarines. We are not greatly worried about gas casualties aboard ship as this type of shell makes an uneconomical load for aircraft; certainly, the Fleet that has control of the air need not fear casualties from this source. Decontamination stations, however, are established aboard all ships.

As a working basis in the past we have expected that two fleets of equal strength would probably inflict about 20 per cent casualties on each other before one or both withdrew. As the size of the fleets increase, the percentage of casualties as a rule will decrease. These estimates have been based on past wars; with the present efficiency of submarines and aircraft they may be entirely too low.

In practically all naval battles, statistics have shown a high ratio of killed to wounded, it being placed at about 1 to 1. Drowning is a major factor in maintaining this ratio; the high mortality rate in turret accidents is also a factor. Individual ships will show a wide variation in the percentage of the cause of deaths; for instance, on one ship practically all deaths will be due to shell wounds, on another it will be all burns, and still another all drowning. Drowning is responsible for more deaths than all other causes combined.

There will always be a marked discrepancy between the force casualty rate and the maximum casualty percentage for individual ships, as some ships will be hit heavily, while others will escape entirely. The wounded percentage should be given primary consideration in developing medical plans for action. Allowing a margin of safety, we will assume that the maximum number wounded on individual ships will be 15 per cent of the ship's complement. It is this maximum wounded rate of individual ships that determines the medical and surgical wartime requirements for this type of ship, while the force wounded rate serves as a basis for computing the evacuation facilities, and this figure is used in deter-

mining the bed accommodations to be furnished by hospital ships or shore stations.

Evacuation of the wounded from combatant ships is frequently a difficult problem. It may be by direct transfer from ship to a shore station, or indirectly by the use of small ambulance boats. Casualties may also be transferred to other vessels such as hospital ships, hospital transports, or other combatant ships. When conditions permit, it may be possible to evacuate the severely wounded by air ambulance. In this war as in the last, hospital ships enjoy no immunity from attacks by the enemy. Our Government in 1918 found it a safer procedure to bring home the wounded from France by returning convoyed troop transports, than by the use of unconvoyed hospital ships.

Hospital ships are of two types—Class "A" and "B." Class "A" or fleet hospital ships in times of peace, travel with and serve the Fleet as floating hospitals. During action their function remains about the same, but for many reasons they cannot be in the immediate neighborhood of the action. Their location, therefore, will depend to a great extent upon the distance of action from an established naval base. Class "B" hospital ships are designed to function primarily on the lines of communication, transporting medical matériel and personnel to the theater of operation, and evacuating the wounded from that area. The longer the lines of communication, the nearer this class will approach that of Class "A" in equipment and personnel. One of the prime requisites of a hospital ship is its ability to take on patients speedily from another ship at sea, and to evacuate them to a hospital on shore.

From what I have already said I think you will agree that the problems involved in Naval Medicine are quite different from those in civil practice. To get an idea of the variety of our work, I would have you visualize the Fleet as being made up of practically every conceivable type of combatant ship, and each type of ship presenting different problems, from a medical standpoint. Battleships are nothing more than highly mechanized, mobile, fighting fortresses, whose guns possess tremendous power of destruction. Unless these guns are manned by healthy, well trained, alert crews, their destructive power to a great extent is impaired.

The crews of these ships are made up mostly

of young men, many of them still in their teens. They are fine boys; they come from our homes throughout the country. They are, however, subject to all of the woes of youth, just as other boys are; they get homesick and seasick, they have family troubles and bellyaches, and some are simply slow in adjusting to service conditions. So it is that the Medical Officer's job aboard ship is a bit broader than merely caring for a lad with a cold or an acute attack of appendicitis. His relation with the crew puts him in a position in which he can be of inestimable value in maintaining the morale and fighting efficiency of the men.

The Medical Department serves the line as a part of the military team, and to function properly, must adapt itself to the conditions created by military tactics and operations; therefore, it is essential that those who serve as a part of the medical units should have a good working knowledge of line tactics. Some of our theoretical peacetime training ideas we know have not proved out under battle conditions, and it has been necessary for us to revise our medical tactics so that they serve the line to its best advantage; this we are prepared and glad to do at all times.

Many of you, I am sure, would be interested in knowing how the casualties were handled in Pearl Harbor. This I cannot go into in detail at this time. To give you an idea of the problem that presented itself on December 7, I would have you visualize a well organized and staffed 500-bed hospital in your own community, and have the census of that hospital more than doubled with acute surgical cases in a period of three hours. Remember, also, that a large number of these patients were unconscious when admitted to the hospital and that the majority of them were suffering from some degree of shock.

Mass treatment must always be a compromise, the individual being sacrificed for the good of the many. Undoubtedly, lives were lost that could have been saved under different circumstances. To have been completely prepared for such an influx of patients would have been an utter impossibility. The information I have received from Pearl Harbor is to the fact that the Medi-

cal Departments of both the Army and Navy handled the difficult situation as well as it was possible to do under such trying conditions. I had the opportunity of seeing practically all of these patients seven weeks after the blitz and was amazed at the rapid recovery most of them had made.

May I ask you to keep in mind constantly, the fact that we are now in mortal combat with inhuman, ruthless enemies, who believe that they are fighting for their very existence? I wonder if history will not record, that it is we who are now fighting for our very existence?

To you who have lost confidence in the heavy battleship, I say be patient and remember that there is no ship built that cannot be sunk, if the attacker is willing to pay the price. With adequate protection from the air, under and on the surface of the sea, the battleship will have its day, and I feel confident that it will be in on the kill.

It was my good fortune to have served throughout the first world war in France as a battalion surgeon in a Marine organization that was brigaded with the Army. This experience led me to believe that the courage and fighting ability of our men, though inadequately trained in many instances, was unsurpassed. During the ensuing years I have gotten a fairly good idea of the capabilities of the sailor-man. The almost unbelievable devotion to duty and the acts of heroism performed on December the 7th was no surprise to me; I would have expected it of such men.

Let us not be complacent, but also, let us not be blinded or frightened by the flood of propaganda disseminated by our foes, both at home and abroad. Let us be honest with ourselves and admit to the strength of our enemies, and be aware of the tremendous task ahead of us. There has never been a time in the history of our country when unity of purpose was so important as it is at the present time. It is not enough that the Armed Services work together smoothly; our civilian forces must also be behind us to the last man and woman if we are to win this war and to continue to exist as a free nation.

THE ROLE OF THE HOSPITAL IN CIVILIAN DEFENSE

WALLACE D. HUNT, M.D.

Regional Medical Officer, Office of Civilian Defense
Omaha, Nebraska

MODERN warfare as introduced by the axis powers has produced certain expressions which have been used so much as to seem nothing but banal platitudes. Such terms as "total war" and "blitzkrieg" are often heard now, yet they were unknown in previous wars. Obviously, modern warfare has introduced some new techniques and requires radical changes in our conception of warfare.

Total war means exactly what it implies. Nations now go to war with every means at their command. No longer do the armed forces alone carry on the war; every man, woman and child is involved in some way. Civilian casualties are frequently greater over a period of time than those of the armed forces. Disruption of the activities of the civilian population may serve the enemy as effectively as overcoming army or navy units. War casualties often become as serious a problem to the hospitals at home as they are to the hospitals in the field of battle. Epidemics at home may well be as serious a handicap to the prosecution of the war as epidemics in the armed forces.

The "blitzkrieg" or lightning war means that like lightning it may strike anywhere with sudden fury. The element of surprise is paramount here, unleashing an attack with lightning rapidity where least expected. Finding a community unprepared, it is easy to play havoc on its industries and its people. Incendiary bombs start blazing infernos which spread rapidly, bringing death and destruction all out of proportion to the actual bomb load employed.

In the early days of the blitzkrieg on Great Britain the casualties were high, the damage extensive. If the armed forces were relatively unprepared how much less so was the civilian population. Out of the chaos there gradually developed a system of civilian defense, a plan of action based on organization, training and discipline. Military strategy is a science of long standing but now there developed a new science of warfare—civilian defense.

At first there was a tendency to regard bomb-

ings in the cities as disasters which could be handled as any other disaster. This proved inefficient and impractical. Under war conditions, with widespread bombing, it is often impossible to obtain aid from neighboring communities. All too often they were also hard hit. There is not time to leisurely salvage what remains when the enemy may return again and again. It became evident that so far as possible each community must be self-sufficient. Peacetime disaster relief methods would not suffice.

The medical care of civilian casualties became the duty of the medical division of civilian defense. Organizing the medical resources of the community gave rise to the development of what became known as Emergency Medical Services. Experience soon demonstrated that the only practical plan was to base the medical units in the hospitals. In other words, the hospital is the very cornerstone on which the emergency medical services rest.

This represents a distinct departure from the usual peacetime disaster relief organization. The older system of putting medical teams into the field, totally unrelated to hospitals, is not feasible. The hospital staff with its nurses and other trained personnel represents the only logical system. These people are accustomed to working together, and the staff represents a balanced organization. It is important, too, that certain personnel be designated to remain at the hospital to care for incoming casualties. The tendency to strip the hospital of its staff in an emergency must be guarded against. Surgeons and others with special training may be of comparatively little value in the field but are of inestimable value in the hospital. Less skilled persons may serve as well in the first aid posts.

The hospital is also the logical place to obtain supplies. There should always be on hand an ample quantity of equipment and medical supplies. It is not intended they should have vast stores of unused material but rather a sufficient stock on hand to handle any emergency. Contrast this again with the unrelated first aid posts that must of necessity have a store of supplies

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.

which may never be used. Multiply this many times and it becomes obvious there must result a serious shortage of such equipment and supplies.

The cost of hospitalizing persons injured as a result of enemy action will be borne by the federal government. A sum of money has already been set aside for this purpose. It is also proposed to reimburse at least in kind, for supplies used in caring for the casualties. Rates to be paid for hospitalized patients have been established. The regional medical officers for civilian defense are at present setting up the administrative machinery.

Publications of the Medical Division of the Office of Civilian Defense have outlined the approved method for organizing the hospital staff into field units. They have also indicated the equipment and supplies which will be found suitable for first aid posts and casualty stations. It should be emphasized here that casualty stations are to serve as hospital substations, located in suitable buildings in areas which may be remote from the hospital and not otherwise adequately served. They may act as filtering stations to prevent overloading the hospital with nonserious cases.

In certain vulnerable target areas it may be necessary to evacuate the hospitals at any time. This may be a partial or total evacuation. It may well be necessary to remove chronic cases from receiving hospitals to make room for the reception of casualties. On the other hand, the more protected hospitals may be called upon to receive patients from evacuated hospitals. This means there must necessarily be a closer relationship between the hospitals, in some cases what amounts to an affiliation. Hospital administrators have a serious responsibility in planning now for any eventuality.

The program of the military in taking over the entire output of blood plasma from the commercial laboratories brings about the problem of securing sufficient quantities for the civilian needs. It will be necessary that all the larger hospitals, equipped with adequate laboratories, plan to establish a blood bank if they have not already done so. These hospitals having blood banks will need to expend their facilities to be prepared for any sudden demand either from their own or nearby communities. Recognizing this need the federal government, through the

medical division of the office of civilian defense, is prepared to offer consultation and advice to those hospitals considered as most likely to have demands made upon them.

The program for the development of extensive blood banks in the hospitals is more than a plan to meet emergencies. Blood transfusion is not a new procedure although many of the refinements of technique are recent developments. In the past, however, the blood transfusion was a tedious, expensive procedure, consequently, too often used only in extreme emergencies. With the proper collection, preparation and storage of blood or plasma it becomes a relatively simple and inexpensive treatment and need not be reserved for patients in extremis. The remarkably gratifying results obtained at Pearl Harbor were due in a large measure to the prompt and repeated blood plasma treatments administered to the casualties. This indicates that blood transfusions, either of whole blood or plasma, will become a more standard procedure in all hospitals. They must be encouraged to be prepared for it.

Practically every hospital has suffered the loss of staff members to the armed forces. It is quite certain there will be further losses. In spite of the hardships this works upon the hospitals, there is not one that is not proud its staff members are serving their country. More sacrifices will be made and made cheerfully to insure sufficient medical personnel for our army and navy. Necessarily, this will impose added responsibilities to those who remain at home. In addition to the increased load of caring for the sick there will be the need for preparing for emergency medical services in these days of total war.

Not alone in medical staff personnel are the hospitals being depleted. Nurses, too, are being called into the services until hospitals are finding it more and more difficult to replace them. Foreseeing the inevitable shortage of nurses and profiting by the experience of England there have been established in many hospitals under the direction of the Red Cross, classes for the training of nurses' aides. This program has been explained to you and yet certain misconceptions occur. It cannot be overemphasized that this is not a program designed to produce practical nurses. Wherever the program has been instituted, reluctant hospital directors and nurses have found themselves enthusiastic before the

first class is completed. These people are not being trained in a vocation but are women of independent income volunteering to aid in the hospitals without pay. Trained to work only under the direction of graduate nurses they increase the nurse's efficiency by doing certain routine tasks requiring no professional training. The hospitals have not yet explored the possibilities in this field.

Another advantage to the hospital gained by training nurses' aides lies in the field of public relations. Intelligent lay women from your community have an opportunity to learn at first hand what is meant by high standards of medical care, what safeguards the modern hospital provides for its patients. These women can and do carry the message to their friends which the professions themselves are too modest to boast about.

When the bombs fall on certain vulnerable target areas it is quite likely calls will come for medical aid to hospitals not at the moment involved. With this in mind it is proposed that a working group, to be used in such an emergency, be organized to move as a unit to the stricken areas. Here again a plan is proposed that, under civilian defense, civilian doctors be organized much on the lines of any army base hospital, although much smaller. Such a unit could move on short notice to bring temporary aid

wherever necessary. It is not planned they would need to go far from their home area, nor would they be called for extended service. At the same time the need for organization now is obvious. Provisions are being made for these physicians to go when and if needed with appropriate officer's rank, salary and traveling expenses.

These are indeed trying times for hospitals and the medical profession. Let it never be said that we shirked our responsibility. There is a very important job to be done and it will be done. It is not all blood, sweat and tears. Out of it already there has developed a closer understanding, a closer feeling that we are all for one and one for all. No longer can we indulge in the luxury of personal feuds, standing on our prerogatives and other such nonessentials. The luxuries, superfluities and *fol de rol* will be abolished. The principles and high standards need not be threatened. A return to the primary principles of medical care—unembellished though they be, cannot be anything but a blessing.

In the meantime rest assured, the hospital and medical affairs in the federal government rests in the hands of responsible people from your own ranks. Our duty is first to win the war; we do not feel it necessary to sacrifice our ideals or standards but rather that because of our ideals success is inevitable.

MAINTAINING STANDARDS OF HOSPITAL SERVICE DURING THE WAR

PAUL H. FESLER

Business Manager, Nopeming Sanatorium
Nopeming, Minnesota

THE standardization program for hospitals was developed following the World War. The minimum standard has not been essentially changed. However, special minimum standards have been developed for practically every professional department of the hospital. Most of them have called for additional personnel, equipment, space and money. We now take them as a matter of course in most hospitals and would hesitate to forego any of them.

In normal times, many of these services have been kept up with the help of interns, techni-

cians, students and the younger members of the staff at a comparatively small cost.

Many hospitals, because of their ability to obtain sufficient funds, have far exceeded the standards. Others, because of their teaching value, have been able to attract young physicians at nominal stipends for their services.

It is really remarkable how hospitals were able to carry on during the years of depression on the high plane established during the period of prosperity.

But now we are at war and if we are to continue to give "the proper care to the sick and injured" as this program is summarized in the

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.

Manual of the College, we must readjust our hospitals on the basis of the present and the immediate future. All factors must be considered and the basis for wartime service will differ in all parts of the country and in all communities.

All hospitals in the community will have to be considered together and the various departments will have to be considered on the basis of the whole institution. Much of the duplication of personnel and equipment will have to be eliminated. We must take our place as a part of the war program and endeavor to eliminate all who can be spared for war service from our organization. The tendency to hang on to all possible for our own hospital is not in the spirit of the times.

It will become necessary that certain procedures which have seemed to be absolutely essential in ordinary times will have to be modified and in many cases completely eliminated. We will not only have the obligations of taking care of our ordinary services, but we will have additional responsibility because of the fact that many of the doctors, nurses and others in the community will be called into the service. Home calls will be greatly limited and additional patients will require the services of the hospitals. It will not be possible for us to build new buildings. We will have to get along with what we have, and in many instances with much less than we now have.

But just how are we to maintain our standards of service during such a period? As time is limited, I am going to endeavor to give a few suggestions which may be of some service.

1. Hospital board members, administrators, members of the staff and heads of a department should obtain a copy of the "Manual of Hospital Standardization" of the American College of Surgeons and familiarize themselves with what is considered necessary to assure each patient entering the hospital complete scientific care, and with these standards in mind proceed to streamline the organization to assure such care with the least possible friction and full use of facilities.

2. A careful study should be made of the physical plant and where possible departments should be combined or eliminated so that each special laboratory, diet kitchen, nurses' station and service department may serve a maximum number of patients with the least possible effort

and expense. In many hospitals the space which is now used for nurses' and other employes' quarters could be used for patients.

3. The personnel of the institution should be carefully studied, to assure that maximum service is given to the patients by the professionally trained personnel and where possible in all departments lay workers should be trained to assist the professional staff so that as many as possible may be released for the service of our country. In many instances the wives of our employes who have been called to the service will be found most useful. These lay workers should be trained to work in a given special department and not transferred from place to place. Full use should be made of volunteer workers under trained supervision. Married nurses should be called into service in our hospitals, and in certain communities, convalescent patients and patients with chronic diseases should be cared for in homes or institutions outside of the hospital. All of the employes should be made familiar with the importance of the steps we are going to take, and all of them should be impressed with their responsibility. Those who are unwilling to cooperate and who are more interested in outside influences, should be eliminated from the hospital staff. The care of the sick is too important, especially at this time, to carry those who are not loyal either to the country or to the institution. We should be alert for signs of sabotage and espionage. In other words, we must have absolutely loyal employes under a strict democratic discipline to maintain efficient service.

4. We must see that our plant is in order. Necessary maintenance and repairs must be kept up. In view of the difficulty in obtaining certain supplies and equipment we are informed that it is to the interest of the war program that our storerooms have necessary replacements in stock to make repairs with the least possible confusion. It is not hoarding to fill our coal bins now. This will make more cars available for war purposes in the fall. In order to give the greatest possible service we should follow the suggestions which have been outlined by the American Hospital Association to be able to care for additional patients. The administrators should be familiar with the war program in the community but should recognize the importance of the hospital and keep tight hold on the reins as the hospital may become the most important agency in the com-

munity on a moment's notice. These are general statements but are, I believe, fundamental.

The Board and Administrator

The responsibility for any hospital program rests on the Board of Management and there is no place on hospital boards for men with selfish motives at this or any other time. The Board must function through a trained administrator. His responsibility, under this war program, is greater than in normal times. He must know about priorities, the trend in prices, the availability of commodities and keep supplies available not only for normal use, but for any emergency which may arise. There has never been a time when the hospital administrator needed vision, ingenuity and originality as he does now. He must lead and must have the coöperation of the staff and all departments if the hospital is to render its best service at such a time.

I now wish to make a few suggestions relative to the important departments of the hospital. First, the Staff:

It has been said many times that a hospital is no stronger than the staff. This is especially true in these times. The purpose of the whole organization is to see that each patient receives the treatment as directed by his doctor. In order to function to the maximum, the staff must now be relieved of the many details which have been performed by younger men who have been or will be called into the Service. Records are most important and if we expect them to be kept up, it will be necessary to provide dictating machines or secretaries to assist the staff. Most hospitals do not take full advantage of the record librarian and their assistants. Forms and records should be studied and all but essential information eliminated. In some institutions the patients's name and family history will be found in four or five places in the chart and many times the name spelled in different ways. Under present conditions, staff meetings should be held at regular intervals and all members should be required to attend.

Heads of departments of the staff will be called into the Service and it will be necessary to combine departments in order to carry on. It may be necessary in some communities, where the staffs are depleted, for men in active practice to assume resident duties for several hours of the day in order to maintain uniform service.

All of this calls for a chief of staff with executive ability and firmness. He should be loyal to the hospital and the management and should be appointed subject to the approval of the Board.

The care of the service patients in most hospitals with the exception of serious conditions has been the responsibility of residents and Junior staff members in normal times. This will now call for additional service on the part of the available staff. The staff will also have additional responsibilities for the laboratory, x-ray, physical therapy, etc. Under the standards, especially trained physicians are required to head these important departments, but under present conditions, if the specialists are called, available staff men should assume this responsibility or in many instances, one man will be able to serve several hospitals. Hospitals without interns and residents will be the rule rather than the exception, and staff members will need to assume responsibility and perform details which have been passed to these men. Much of the work can be eliminated without seriously effecting the hospital service.

The Nursing Department

The nurses have always carried the heavy load in the hospital. During the past twenty years, the standards of nursing service have been greatly improved. Supervision has been increased, hours have been shortened, the work formerly done by the young student nurse has been taken over by orderlies and maids and in many hospitals. Most hospitals have already felt the shortage of nurses and with the appeal from the government for additional nurses in the service, the hospitals, in order to be loyal, will have to train additional personnel to take the place of trained nurses. This will be best accomplished by training young women to work in certain departments under the supervision of the nurses and in some cases even lay persons who have been trained for such supervision. This will work best if these lay workers are kept in their particular departments and not transferred to different divisions in the institution. In some communities married nurses have been called into service, either on full time or for a short time a day to relieve regular staff members. Those in such service should feel that this is service to our country in time of war, and should not expect excessive compensation for such

work. Special nurses and maids, who have been trained to help in the care of patients, should be relieved from detailed clerical work by the employment of clerks and the volunteer helpers. The "Grey lady" movement is of great value in some communities, but has not been developed in smaller communities, as it should be. This is a good time to develop these volunteer agencies. The Red Cross volunteers are now helping in some hospitals. Use of special nurses should only be permitted where the care of the patients call for special care, and should *never* be used except for patients so ill that the doctor feels that he must have this special care regardless of the ability to pay. In many instances, it will be found that one special nurse is able to care for several patients. All hospitals should study the nursing service carefully not only to conserve time and labor within the institution, but to accept their responsibility in the nursing service of the community. Hospitals are in a position to aid in the first aid program of the Red Cross.

After many years of effort on the part of the National Nurses Organizations, the government has finally recognized the importance of helping hospitals in their educational program and is subsidizing certain institutions in this work. Most hospitals are unable to finance nursing schools. A number of the fifty nursing schools which have been closed in the State of Minnesota could be opened, if the hospitals were given additional funds for their educational program.

It seems that the nurses' courses should and could be shortened during these times, and I feel that the nurses organizations will find a way to bring this about. Nurses who have been out of practice for many years have found it of interest to come into the hospital for refresher courses in nursing procedures, and have been found to be most useful because of the experience they have acquired since leaving their hospital work. These women naturally appreciate the importance of the hospital's responsibility to the patient and the community beyond that which is expected of the young inexperienced nurse, and they feel honored to have an opportunity to serve in these critical times.

I have always advocated the highest standards in the education of nurses. For the past several

years, it seemed that this had been overdone, but I am sure under present conditions that these nurses with their exceptional training will be of great service not only in the service of the government, but in the supervision and training of lay personnel for the civilian hospitals and the nursing program of the community.

Dietary Department.—The Dietary Department is one of the important departments of the hospital. According to the standard, a trained dietitian is required at the head of this service. The dietitian and her assistants should begin now to train lay assistants for certain services, as it will be difficult to find a sufficient number to keep the service on a normal basis during the war. The dietitian should be relieved of the purchasing as much as possible, but at the same time should have sufficient control of same to insure the foods required for adequate scientific diet. We should investigate the equipment of this department and be sure that parts are on hand to take care of emergency repairs. The storeroom should be carefully watched and staple supplies be kept available as much as possible. As this department spends about one-third of the money in the average hospital, it is important that it be kept under careful control at all times.

The Engineer and Service Department.—We are warned to be ready for emergencies. Service departments under the engineer will have this responsibility. Our engineer should be qualified, first, by meeting the requirements of the licensing board, second, by complete understanding of all equipment and machinery and with sufficient ingenuity to make necessary repairs without dependence on outside assistance. The engineer should train his assistants to be able to function if he is absent from the institution. It is imperative that he have a complete understanding of the electrical and water supply, with all switches, motors, cut-offs and so forth, and he should be familiar with the regulations which will be set up in regard to blackouts and other wartime precautions. He should see that equipment is available for the immediate removal and protection of all patients if necessary, and to set up facilities for the admission of an unusual number of new patients. The matter of fire protection is important and the fire fighting equipment, signals and so forth must be understood by the entire engineering staff. The local fire

department and the State Fire Marshall are glad to help make such plans. The instructions relative to the control of incendiary bombs must be understood. The engineer has a major position in the hospital at this time, and his advice and council should be respected by the Board and the Administrator. If his authority is not sufficient to carry on his functions, his value will be lessened. Too often men without vision and training hold these important positions in the hospital. Good men above military age are available if we are willing to pay the price. A qualified engineer should be on the grounds at all hours and, under present conditions, enough men should live in the institution to assure complete protection. One reason I emphasize this department is that women will have to assume positions formerly held by men as janitors, kitchen helpers and so forth, so this will mean that the engineer, firemen, carpenters, painters, electricians and watchmen will be about the only group available and should form a sort of emergency unit.

Where unions are involved, we should endeavor to convince them of the tremendous responsibility of their members at this time, and to have hospitals considered as a part of the defense machinery. On the other hand, we must realize that the need for mechanics is such in defense work, that we must coöperate by paying wages commensurate with those paid in other activities where such men are needed. The men in this department should be trained to perform duties in other than their special department and to relieve in as many positions in the department as possible.

Housekeeping.—This is an important department of the hospital which is not always given its proper place. A good housekeeper will work closely with the nursing and dietary departments. Duties of maids in many instances may be arranged so the workers are interchangeable. In most institutions, the maids should work as a part of the nursing staff and be directly under the nurse in charge of the unit. The maids can do many things for patients which have been done by nurses. They can be trained for this work and be limited to duties not professional. In many hospitals, workers now known as nurses' aids are making beds and, in some instances, bathing patients. These women can carry trays and perform other duties under the

supervision of the nurse as well as cleaning work, all of which will help at this time.

Patient Help.—In many hospitals, we have convalescent patients who can be of help and will be glad to render service if they realize the importance of it as a part of the war effort. Some of the work which has been done by occupational therapy department is not of practical value. I think we could find duties for these patients which would contribute much to the smooth operation, and we should take advantage of all such individuals, and I do not think, in some instances, it would be improper to give them a small stipend for the service rendered to the institution.

Out Patient Department.—Another department of the hospital which is most important at this time is the Out Patient Department. Many patients who are now filling beds in hospitals could be cared for as out patients. However, as the younger men have carried the load so far as professional care is concerned, it will be necessary that the older members of the staff take this as a part of their responsibility.

Social Service Department.—The Social Service Department is important and will have unusual duties to perform. However, as there is a scarcity of trained social workers, it would be well to try to find volunteer workers to carry on some of this work, as many patients can be discharged from the hospital if their home conditions are arranged for their care. In most communities, there will be found a social worker or a public health nurse who can give instructions to volunteers. Those who have received the first aid and volunteer training of the Red Cross should be of great help.

I have only touched a few of the highlights. To summarize, I would say that the Board, the Administrator and the heads of the key departments of the hospital will have to feel that their responsibility in this war effort is in their own hospital and to their own community, and that we should relieve as many workers as possible to enter the war service. We should conserve our supplies and to be sure that we are ready for emergency; that all possible beds are available in the most convenient locations for the care of a maximum number of patients, and that the

acute hospital should be primarily for the care of patients who can not be cared for otherwise and that other units should be found for the care of those who do not need this active care; that the Public Relations Program should be carried on in such a way that the whole community will

appreciate the value of their local hospital; that our hospitals will work together so there will not be duplication in the way of equipment and personnel; and where there is competition, that it should be on a friendly basis and all of us work for the one thing—*The Winning of the War*.

MAINTENANCE OF ADEQUATE PERSONNEL FOR HOSPITALS

THOMAS E. BROADIE, M.D.

Superintendent Ancker Hospital
Saint Paul, Minnesota

THE maintenance of adequate personnel in hospitals is a currently pressing problem which admits of no solution by formula. This state of affairs is probably due to the fact that preparation for the existing emergency has had to develop so rapidly that clear-cut methods have not been available. Hospitals with their varied responsibilities and multifold necessities for all types of trained labor are finding it increasingly difficult to maintain their staffs at proper levels. This fact in combination with increased demand for service presents difficulties of considerable proportions. All groups of hospital employes are affected. With tendencies in recent years to employ young individuals, both male and female, the turnover at present in hospitals is exceedingly rapid, due to the fact that these individuals are being taken into armed services and defense industries.

For purposes of developing the subject, the matter of maintaining personnel in the professional departments will be treated first. There are two classes of professional employe principally affected, namely, physicians and nurses. The Surgeons General of the armed forces have agreed with Selective Service officials that interns in hospitals will be deferred for a period of one year. At present reckoning, therefore, hospitals are assured of intern service. Resident physicians of greater than one year's experience, however, will be hard to find after July 1. Local Selective Service Boards, however, have been co-operative, in this sector at least. The Office of Procurement and Assignment should be helpful in declaring certain resident physicians essential.

In those instances wherein the services of residents cannot be obtained, the attending staff members will simply have to assume the duties ordinarily performed by residents.

All hospitals have already felt the shortage of nurses. In some sections, particularly in rural areas, the shortage of nurses is acute.

Efforts at relieving this shortage may be grouped under three headings: (1) utilization of inactive graduate nurses; (2) the training of nurses' aids or ward helpers; (3) utilization of volunteer groups for limited nursing services.

The first method obviously will not completely solve the problem. It is, however, useful in making available nurses of graduate level, who, though not plentiful, represent a trained class and can soon be entrusted with responsibilities of supervisory grade. In the larger communities nursing organizations are appraising the inactive nurse facilities. Older graduates are going back into uniform. Refresher courses have been arranged for these groups, and the response has been gratifying.

The second method, namely that of training women at nursing aid level to aid in relief of a reduced graduate staff, is gaining considerable momentum. In this area the Work Projects Administration has undertaken training programs for this purpose. These classes have been held at three governmental hospitals in the Twin Cities. With the war at its present tempo, it is conceivable that this type of employe will assume some of the duties usually performed by graduate nurses. Graduates remaining in hospitals will act principally in supervisory capacity. Any hospital with its own staff can train these women creditably without use of governmental

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.

subsidy. A definite course of study, however, should be set up, and instructions should be explicit.

The third source of personnel with some instruction in nursing procedures are the volunteer trainees who are being trained under the direction of the Red Cross. Many women of all communities are anxious to serve in some capacity that is helpful to essential services. These women by proof of actual practice respond quickly to training methods. Classes for these individuals in this area have been conducted by graduate nurses of finished competence in nursing education. Already there is a considerable group of women available for this type of service.

The non-professional classes of personnel also represent considerable problem in the present emergency. The men in these classes of military age are leaving their jobs precipitately and in considerable number. The women are leaving to accept jobs at better wages in defense plants. The problem is not so complicated as with professional classes, due to less urgent need for

prolonged periods of training for these groups. Nevertheless, the turnover in these classes is bothersome. There seems to be only one solution, namely, the employment of older individuals. This procedure is more satisfactory than it may seem upon first glance. There are a great many people in advanced age groups who can handle any specific job creditably. Perhaps more time may be required, but older people are often more thorough and accurate than younger ones. The writer believes the older person quite acceptable for most non-professional jobs. There are also persons available in both sexes with minor physical defects who can perform creditably. This, of course, raises the compensation problem, but there seems to be no avoiding such at present.

In conclusion, it should be stated that the difficulties of maintaining hospital staffs during the present war effort, though troublesome, are not yet insurmountable. There are at least evidences of carefully analyzed effort in the direction of amelioration.

CONSERVATION OF PERSONNEL, SUPPLIES, AND LABOR

SISTER M. PATRICIA, O.S.B.
Administrator Saint Mary's Hospital
Duluth, Minnesota

TODAY, every alert administrator is conscious of the problem raised by the necessity of conserving personnel, supplies, and labor in the hospital. Though theoretically such conservation was always accepted policy in every well-run hospital and the desire of every administrator, its practical aspects left much to be desired. It remained for the present national emergency to awaken the interest and coöperation of other members of the hospital personnel and the medical staff in such conservation. All are keen for victory. Now is the moment for the administrator to seize his opportunity and, under the banner of patriotism, do for our beloved country what he has never been able to do for his own peace of mind.

The success of any program in the hospital must begin with a well-defined administrative policy. How shall the administrator build such

a policy on the subject of conservation of personnel, supplies, and labor? There are several sources of help open to him. Naturally, he will have in mind all the pet schemes he has never been able to put across. Lest these ideas be outmoded, he should check them against the current hospital literature. The magazines today are devoted almost solely to articles on the relation between hospitals and defense. Then, there is a wealth of inspiration and sound policy to be gleaned from conferences with other administrators such as this one which Doctor MacEachern has arranged for us today. A third and very fruitful source of knowledge is to be had in contacting the medical staff and hospital department heads and other hospital personnel, both professional and nonprofessional. This contact can be direct and personal or by written questionnaire. The personal approach yields greater returns, but it is so time-consuming that its use is impractical in all but a few cases. Incidentally,

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.

a trip through his hospital at night with the night supervisor is an eye-opener for most administrators. Finally, the administrator will need to organize and coordinate the information gained from all these sources into a definite policy of conservation for his own institution. Fortified by his own clear thinking, he will be ready to set up the conservation program and put it into execution.

The first step toward effective operation of a conservation program would appear to be a conference between the administrator and a very limited number of key people in his institution. Small numbers conduce to informality and hence freer expression of opinions. At this conference the administrative policy will be discussed and probably modified as newer, better ideas are presented. Tentative plans for practical application of the program will be advanced, discussed, rejected, or accepted.

The next step will be a full conference of department heads. Again the administrative policy will be set forth, as well as such plans for execution as were drawn up by the first group. If the subject of the conference has been included in the call to the meeting, the department heads should be ready to advance many ideas for the development and execution of the program. Before this group adjourns, the final outline for the enforcement of the hospital's conservation program should be drawn up. Care must be taken to avoid overlapping and duplication of effort and to assign definite responsibility for each phase of the program. A copy of the outline in writing should be available to each department head as soon as possible after the meeting. Upon receipt of this instruction sheet, each department head should call a meeting of the personnel of his department to acquaint them with the plans of the administration and enlist their enthusiasm and support. The best psychological approach with this group will undoubtedly be the patriotic theme.

That this paper should bring to you some worth-while ideas on this subject of conservation and not be a mere recital of what you all know better than I, I have sent out a number of questionnaires. One group went to administrators throughout the country, and their response was gratifying. Another different group of questions I gave to the medical staff of our hospital and

still another to the department heads and all other personnel. The doctors were interested and gave many good suggestions. Because there was no verbal explanation given to the nonprofessional personnel, the percentage of response was not high. What follows in this paper is the result of information gleaned from these questionnaires.

Personnel

Intern Shortage.—Have doctors assist each other at operations.

Give interns stenographic help. Volunteer stenographers may be so used. Dictaphone equipment helps.

Instruct nurses to do some procedures now left to intern.

Nursing Shortage.—Check all procedures to eliminate the unnecessary and "streamline" the remainder.

Eliminate luxury services.

Where teaching facilities are available, enroll more students.

Neighboring hospitals might share instructors.

Use Red Cross Nurses' Aides, WPA and NYA Hospital Aides.

Use older nurses; if home duties prevent full time work, arrange their schedules accordingly.

Distribute hours for operations so less personnel is needed.

Labor

Absorb labor that can serve in hospital duties but is unable to serve industry.

Use labor-saving devices when possible, such as ice machine; candlewick spreads which save mangling.

Employ more workers from the older age group, thereby reducing turnover.

Pay adequate salaries to hold efficient workers, and let inefficient go.

Have department heads study overlapping of duties and waste motion in their subordinates.

Have department heads draw up a simple but inclusive procedure for each job to insure continuity of efficiency in face of more rapid turnover. Each new worker can be given a copy of the procedure and held strictly responsible for following it.

Save time for new employees by labeling doors they must find.

Supplies

Electricity.—Keep window shades rolled to the top to save electricity.

Remove bulbs to prevent the use of unnecessary fixtures.

Put up a notice near light switches, "Turn Off Expenses." Make a cartoon of it.

Study your electric power to learn the time of the "peak load" (usually 8-10 a.m.). Try to divert this; e.g., by baking in the afternoon.

The electric power in some passenger elevators does

not shut off automatically when the elevator is not in use. Therefore, be sure the switch is turned off.

Use lower watt globes in some places and fewer globes of greater power in others. Two fifties give better light than four twenty-fives, and globes are saved.

Linens.—Avoid unnecessary draping for minor surgery.

Discontinue ether socks and pneumonia jackets.

Have patients bring gowns, pajamas, et cetera.

Don't be so generous with linen.

Study laundry procedures; 75 per cent of wear and tear of textiles comes from laundering.

A study of gauze consumption will show many possible savings. Fewer layers of dressings and smaller sizes. Not all need be sterile.

Office Supplies.—Use both sides of all chart forms. Use backs of letters or scratch paper for carbon copies.

Cut off the top of carbon paper and thus prolong its life because keys will strike unused portion.

Use one paper towel rather than two.

Check paper-cup dispensers to see that only one cup is released at a time.

Require return of stub pencils before giving out the new.

Check the floor for rubber bands and paper clips each night.

See that nurses do not waste chart paper by writing in headings on sheets that are not used.

Write shorter letters; use narrow margins.

Wash steel pen points daily to prolong life.

Food.—Hospitals in rural areas should do more home canning.

Study diets with a view to simplification and curtailment of special diets ordered.

Require the restriction of certain food items such as sugar, pineapple, tuna fish.

Stop serving scarce and imported foods. Use more of the extra standard rather than so much extra fancy canned foods. Food value is the same.

Pay more attention to patients' tastes; e.g., don't serve cake on tray of patient who has said he never eats it.

Other Supplies.—Hypodermic needles can be resharpened by hospital personnel and re-used.

Hems of old sheets make good T binders.

Hand powder used in the operating room can be salvaged and sterilized for repeated use.

Regulating faucets in operating and delivery rooms to run a smaller stream during scrubbing saves water.

Finally, there are a few general principles which apply to any conservation program. For example: cut down on amounts requested in order to make the personnel more economy-conscious; keep prescriptions down to minimum practical amounts; have rigid issuance of all supplies by means of requisition. In conclusion, now is the time for the administrator who really wishes to have an effective conservation program to consider the installation of a perpetual inventory of all supplies—if he has not already done so.

MEETING THE INCREASING COSTS OF HOSPITAL SERVICE

A. G. STASEL

Superintendent, The Eitel Hospital
Minneapolis, Minnesota

THE need for national economy as an aid to the United War Effort is no longer a figure of speech, but a thing of reality. Time, effort and supplies are the factors that will tip the scales of justice. Economics, large or small, whether effected in the home or hospital, lend their weight to this united effort. We must *all* be economy-conscious at all times no matter what our relationship to the hospital.

War brings with it economic and social adjustments which must be recognized whether we individually wish to or not. Increased payrolls

and increased commodity costs are already with us to a considerable degree and greater increases are ahead of us to an extent, in all probability as great as we have already had in the past six to eight months. The reasons for these increases are quite obvious. Will these costs recede after the war? They no doubt will to some extent, but we will not be back on the old basis. This was true of the first World War and will no doubt be true of this one. We hospitals cannot escape the implications of a changed economic and social world. The influences of social security, forty-hour weeks, higher wages, inflation, will all affect hospital costs, either directly or indi-

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.

rectly, and the increased costs we are now faced with will no doubt be permanent to a very great degree.

How are we going to meet these increased costs? The easiest way, of course, is to increase our rates for various services as such costs increase. And this becomes an absolute necessity if the Voluntary Hospitals are to survive. Increases in rate structures may be approached on a permanent basis by increasing all charges on a "dollar-wise" basis, or on a temporary basis by increasing all charges on a "percentage-wise" basis. This latter basis has been called by one hospital association "a defense surcharge." The latter basis, namely, percentage-wise increase, carries with it the implication of being tied up with the war emergency and as a matter of good faith will be removed when the need therefor has been removed. We hope this is so.

Hospital Administrators should make themselves very familiar with their costs in all departments of the Hospital and should check these costs, under present conditions, almost weekly or at least monthly and should see to it that the hospital is properly reimbursed for services rendered. This does not preclude charity where charity is deserved. Insurance cases should be paid for on a full per capita cost basis and not less. Hospitals cannot subsidize any insurance or compensation cases. This is also true of Group Hospitalization cases as well. Dr. Fred Carter, when president of the American Hospital Association, gave us a word of caution in this regard when he said "In communities where active service plans are operating, the hospitals are becoming more and more dependent upon them for payment for services rendered. . . . as the movement grows, and the proportion of hospital income from this source increases, the per capita income of the hospitals tends to become fixed at a level which, in many instances is somewhat below per capita costs. In the meantime the per capita costs may increase and the disparity between the two may prove ruinous to the financial structure of hospitals. This situation becomes doubly serious when we stop to realize that many of those who formerly constituted our paying clientele, upon whom we depended for certain profits to offset losses on free and part-pay work, now come to us as subscribers to hospital service plans. In the face of such facts it becomes obvious that unless the plans make every

effort to keep their per diem rates to hospitals at levels approximately equal to per capita costs, the hospital in order to avoid embarrassment may find it necessary to devise services to sell down to a price instead of up to a standard." This principle is more important now and in the future than ever before. Our Voluntary Hospitals have been pretty proud of their tradition of services to all classes in the community. The extent to which our hospitals render community service as distinguished from self-supporting service varies of course, but if community service becomes too low or vanishes, the distinctive status of our Voluntary Hospitals, as well as their immunities, will be in peril. With the disappearance of gifts, endowments and the like, it becomes more necessary than ever that these sources of income pay their way in full, in order that in turn our social obligations or charity services to the community may be met. Our very existence is contingent upon this principle.

The time has come in hospital administration when we must think in "stream-lined" terms. Co-operative effort within the institution, as well as between the institutions in the same locality, is now fundamental, for it is only through this co-operation within and without that hospitals will survive the trials and tribulations which they now face and will face for some time to come.

For the past few years we have become soft and self-satisfied. From now on we must do a better job—or else. We must now become penny-wise if we are to carry on in a successful way and save dollars. The secret of successful operation of an acute hospital is in "turn-over" and not in occupancy. The faster the "turn-over" the greater the per diem income. There is not a need as a rule for more acute beds in a community, but there is a great need for more sub-acute beds at lower cost.

I have mentioned that the easiest way to meet increasing costs is to increase rates, which is necessary, of course, to a certain degree. This is the solution to only part of the problem, however. Increasing rates without doing a better job of collections gets us nowhere. Why not think, therefore, in coöperative terms (particularly in larger communities and this may be applied state-wide as well) and consider the establishment of a centralized credit and collection service for hospitals, together with a financing bureau to assist those who need this service.

Group Hospitalization has helped in this regard but we still have the major problem with us. Experiments to this end in other communities have reduced collection costs by one-half and increased the working capital of the hospital thereby. Why not here? We can do a better job through coöperative effort.

Let's look at the other side of the question, that is, the cost side of our hospitals and what can we do to meet rising costs in a better way.

We all take care of patients and the fundamental problem here is, for all practical purposes, the same.

Why don't we standardize our intra-hospital history forms and use the Monolithic Method of printing as is now the custom with large users of printing, such as insurance companies, etc. We can reduce our printing costs 40 to 50 per cent in this way.

Why not centralize our major purchasing problems? With the complexities of priorities, new processes and substitutions, we, all of us, are more or less in a whirl. Big business has recognized the advantage of pooled purchasing; the state of Minnesota is doing it at a big saving. Our hospitals—combined—is big business. What is wrong by saving 10 to 20 per cent in this way?

A centralized employment bureau serving our northwest area would go a long way towards not only stabilization of employment and reducing turn-over, but would again result in considerable savings to all of us.

Central schools of nursing for theoretical instruction developed by zones instead of by individual hospitals would definitely reduce costs of nursing education.

The present nurse shortage is to some extent our own fault. We shall get nowhere by "crying over spilled milk." It is now clear to most of us that we shall have to do without all luxuries and many so-called necessities for the duration of the war and that a great many comforts will have to be rationed or should. Special nursing will come within this category. Hospitals and the public must be relieved of the expense of maintaining Graduate Nurses or special duty nurses when such nurses should take their places on permanent payrolls and spread their efforts in the care of a larger number of patients. A distinction in the care of the acute as against the subacute patient should now be recognized. Judicious use of the Volunteer Nurse Aide, as well

as the Trained Aide, will, of course, be of considerable help. We need many kindly and intelligent hands for the bedside care of the patient and these can be obtained if we will use a little common sense and work together for it.

Let us consider some of the economies that are seemingly small, but are necessary at this time and which are all around us if we keep our eyes and ears open and become truly economic conscious.

In reading a recent copy of *News-Week*, my attention was called to an item of suggested economy by the American Institute of Laundering, which suggested that diners lean well over the plate while eating to prevent spots on the table cloths. The saving of laundry wear and tear is considered more important than good table manners now that impending shortages of textiles threaten the supply of table linen. Suggestion: Analyze your linen usage at its source. School your organization in linen economy. The results obtained will be worth the effort.

Food costs are mounting. Can anything be done about it? Yes, analyze the food service. Do you serve too much sugar, butter, bread, potatoes, meats on trays that later come back to help fill the garbage cans? Garbage can inspection is a regular procedure in Army Hospitals to check against waste. Why not in the Civilian Hospital? If our hospital administrators would do this only once in a while, they would learn considerable about food waste. Then there is food substitutions which an alert Dietetic Department will carry out in these times without anyone noticing any change, except that perhaps the Hospital Administrator subsequently wakes up to the fact that this food budget perhaps has not gone up as fast as others he knows about. Food cost consciousness through an educational program throughout our respective organizations will also help reduce food waste.

When considering drug, medical and surgical costs, substitutions are perhaps limited and yet if we keep our medical staffs conversant with costs from week to week, I am sure we can count on their support in keeping ultimate case cost in line. Again education as to rising costs will reflect itself in economies.

The use of electric lights and power unnecessarily has been a bug-bear to all of us at all times. Why not have the following notice print-

ed and placed on every light switch to make us all conscious of this cost?

NOTICE

In coöperation with the United States National Defense Program we are asking everyone to conserve electricity by making sure that all lights are out when not needed. Uncle Sam needs power.

Let's Help Him

General Maintenance costs can be reduced. Our painters, electricians, carpenters and mechanics appreciate attention to their needs. If we, as Hospital Administrators, show a real interest in their work and accomplishments, we can rest assured our maintenance departments will respond whole-heartedly to our desires for a real war economy. They will appreciate the responsibility.

Many other economies are obvious to most of

us, such as in the matter of rubber gloves. When worn out the fingers may be saved for finger cots and the balance cut up for rubber bands. Scotch tape may be often substituted for cloth tape. Rubber sheets should be guarded. They are now worth their weight in gold and you may have to turn in an old one to get a new one before long. Regular inspection of equipment in each department should result in definite economy.

Save everything—cans, drums, barrels, rags, rubber goods, paper. Have some central place where these items can be collected or sold. It all helps in this all-out war effort.

We are a nation at war—a war that none of us desired or like. It is difficult to realize that scarcities face us on every side, but our fighting forces must come first. So let us all "tighten our belts" a little more. Our present economy program is a "must" program if we are to survive.

PRIORITIES AND THE PROBLEM OF OBTAINING HOSPITAL SUPPLIES

ROY WATSON

Rochester, Minnesota

I SHOULD like to compliment Dr. MacEachern for arranging this timely meeting. The present emergency is presenting so many new problems, that I am sure all of us can benefit from these informal discussions although because of rapidly changing conditions what we discuss today may be out of date tomorrow.

As you know, hospitals have been given the privileges of two ratings—the A-10, P-100 blanket priority rating, and the PD-1-A rating.

The A-10 rating has been granted for maintenance, repair, and operating supplies. Its use does not require special permission from the War Production Board. If your supplier requests a priority rating, the procedure is to write on the purchase order or in an accompanying letter as follows: "Material for maintenance, repair, or operating supplies under rating A-10 on the Preference Order P-100 with the terms of which I am familiar." The order must be signed man-

ually by an officer or authorized executive of the hospital.

In view of the large number of industries that are being placed under these ratings, it remains to be seen how much help they will be to hospitals. However, since hospitals are definitely necessary to public health, there is a possibility that they may eventually receive a higher rating, as did the public utilities a few weeks ago. For this reason, I urge that hospitals do not abuse A-10 or mis-state their requirements, for if this rating is violated, they may jeopardize their chances for a higher rating or lose it entirely.

The PD-1-A rating is for improvements, additions to buildings, or new equipment. Application must be made to the nearest branch office of the War Production Board for triplicate forms and instruction sheets. After completion, these forms must be sent to the Director of Industry Operations at Washington. They must specify the latest date on which the items requested can be delivered to fill their purpose. If the request is approved, a specific rating for a specific purpose

Read at the War Session of the American College of Surgeons, Minneapolis, Minnesota, May 1, 1942.
The author is President and General Manager of the Kahler Corporation at Rochester, Minnesota.

is given to the order and two forms are returned—one for the hospital's files and one to be given by the hospital to the supplier. In this connection, it should be borne in mind that certification by WPB covers only the specific items requested and has no bearing on future orders.

Cases will probably arise when there will be questions as to which rating to use. My suggestion is that in all cases, except those involving a new building, that the hospital try the A-10 rating first. If this rating does not enable the supplier to handle your order, then try PD-1-A.

The problem of obtaining hospital equipment, furnishings, and supplies might be summarized in a general statement to the effect that everything will become increasingly difficult to obtain and that higher prices are certain. No doubt all of us have already experienced this definite trend, whether we have been trying to purchase linens, canned food, furniture, or operating room drugs. Furthermore, I am confident that many more government controls and rationing plans will soon be in operation. As a result, and despite our priority rating, we will have to try to find new sources of supply for the things we need, and we even may have to purchase through retail channels. The manufacturers' and jobbers' stocks will necessarily be depleted first, and in many cases when these stocks are gone, there will be no materials available for replacement or new manufacture. This also will mean that we will have to either go without certain supplies, get along with what we are now using, or use substitutes. However, while I think that shortages will become much more acute than many of us realize, I believe that enough supplies, such as gauze, drugs, syringes and needles, instruments, sutures, and like items will be available to hospitals in small quantities to enable us to function—but not to operate "as usual."

For the past several years a committee of the American Hospital Association has been work-

ing with the United States Bureau of Standards on the problems of standardization and simplification and has done a very good job. It seems to me that now is a very appropriate time for hospital superintendents and medical directors to analyze their situations with respect to standardizing both equipment and supplies in their various departments. This simplification will tend to reduce the number of items bought, and in many instances will enable hospitals to purchase the accepted articles in sufficient quantities to reduce the unit price. Inasmuch as a later speaker will discuss the very important subjects of conservation and economies, I merely wish to call this program to your attention so that you may capitalize on the efforts of this committee.

I might also suggest that the members of the various state hospital associations send to their secretaries a list of the excess used or unused equipment or supplies which they might have in their storerooms, attics, or basements. I am sure that many of us have furniture, kitchen equipment or supplies which we will never use but which might be serviceable to some other hospital. The secretaries then could publish such lists in special bulletins so that the information would be available to all members. This procedure is being followed with considerable success by the Educational Buyers Association and has made available several items of equipment which cannot be purchased on the market.

May I again stress the importance of not abusing our priority ratings and of doing everything possible to preserve the life of our present equipment and supplies. Procurement in all lines will become much more difficult, and superintendents and purchasing agents are being challenged to locate new sources of supply and substitutes, and to develop new techniques in operation.

The gap between proven knowledge and effective action based on that knowledge is nowhere more glaring than in our fumbling efforts at control of the most common of the infectious diseases.

We know that the time lost from the common cold would build hundreds of the planes we now need so much. Yet, the simple prophylactic measure of isolating all those with colds in early stages is applied routinely to a few school children only.

This failure to coordinate knowledge and action is also all too common in our efforts to control and eradicate tuberculosis.—*Tuberculosis Abstracts*, April, 1942.

A STUDY OF OSTEOPOROSIS BY MEANS OF CONTROLLED X-RAYS OF THE BONES

Part I—Method

E. L. GARDNER, M.D.

Minneapolis, Minnesota

IN 1933 the author called attention to a group of patients with gastro-intestinal complaints who had a definite osteoporosis of the bones (hand and wrist), when compared with normal subjects of the same sex who were used as controls.¹ The difficulty in using this technique depended upon the fact that the same normal controls were not always available for comparison. We have, therefore, worked out the following new method.

Normal subjects in perfect health and free from all abnormal symptoms have been filmed, using a series of exposures which differ from each other by that exposure necessary to penetrate 0.5 mm. of aluminum. The exposures are measured by means of an aluminum ladder (Fig. 1) placed on the cassette at the time of the exposure. This aluminum scale varies in thickness, from 2.0 mm. to 5.0 mm. The exposures, therefore, for this series, called the "master control series," are equivalent to penetrations of 2.0, 2.5, 3.0, 3.5, 4.0, 4.5 and 5.0 mm. of aluminum respectively. The resulting films vary, then, from those which are definitely under-exposed to those which are over-exposed. The variable is the time of exposure. The rest of the x-ray technique including distance, voltage and development, is constant. Several "master control series" have been made varying according to age, sex and activities of the normal.

When the unknown patient reports for examination, the hand and wrist along with the aluminum scale are filmed. For purposes of interpretation the scale on the unknown film is compared with the scale on the control film so that the two scales match perfectly in density (Fig. 2). This records the difference in density of the bones between the control and the patient, thereby giving definite information as to the presence of osteoporosis. Then the densities of the bones, control and unknown, are matched as closely as possible, and, if the difference of alumi-

Fig. 1. A semi-diagrammatic sketch of the aluminum ladder. The figures indicate the variations in thickness in millimeters.

We are indebted to Mr. Carl Reed, of the Pengelly X-ray Company, for the suggestion as well as the construction of the aluminum ladder.

num penetration is only 0.5 mm., the osteoporosis is graded 1; if 1.0 mm., graded 2; if 1.5 mm., graded 3; and 2.0 mm., graded 4.

ucts in the diet very frequently show osteoporosis. This is especially true when the water is "soft" and free from calcium or when so-called "alkali

Fig. 2. X-rays of the bones of the hand with the aluminum ladder in place. These show equal densities of the aluminum ladder, and the variations in bone density in the Control, Grade 1, Grade 2, and Grade 3 osteoporosis.

Results

1. An osteoporosis equal to grade 1 is not uncommon in healthy people. There is very little difference between the right and left hand. If osteoporosis is present in the hands and wrists, it will also be found in the jaws, spine and pelvis.

2. In this geographic area (Minneapolis and Saint Paul) people who do not use dairy prod-

water," containing excess magnesium, is used.

3. This technique for the determination of osteoporosis has been invaluable for diagnosis of probable mineral depletion and also for the determination of the value of therapeutic procedures for restoring normal bone densities.

PRESIDENTIAL ADDRESS

HERBERT Z. GIFFIN, M.D.

Rochester, Minnesota

MY presentation will be partly a report of my activities and partly a discussion of some, and only some, of the aspects of the medical situation. Following this I shall present a concrete suggestion for future investigation.

From the time of the 1941 meeting to January 1, 1942, I traveled, usually with our former president, Dr. B. J. Branton, sometimes alone, to meetings throughout the state in order to emulate my predecessor, to become better acquainted, to transmit the policies of the Council and the House of Delegates, and to obtain the opinions of members of the Association. In the six months since January 1, I have traveled several thousand miles to medical meetings, committee meetings, and meetings of allied societies. This has meant an average of two meetings a week. The work has been different and not especially difficult. It has been pleasant and stimulating although I have had misgivings with respect to my effectiveness.

The president can accomplish nothing alone. The councilors and other officers of the Association can do very little by themselves. The first essential to an active and effective Association is an efficient administrative staff which fortunately we do possess. Most important, however, to a program of advancement and expansion are active committees, and an essential of an active committee is a well informed and enthusiastic chairman. It is only through committees that our work can be effective. The time has passed when a chairman may say without embarrassment, "Your committee has had no meeting during the year." It is not necessary for me to rehearse the projects of our committees. You have had their reports and have been informed of their activities during the year through miscellaneous publications, *News Letters*, and *MINNESOTA MEDICINE*. We all know of the national recognition which has been given to the work of some of our committees, and I am glad to say that all committees of the Association have concrete plans for the future. Let us continue to support them in their work. Members of these committees give time

and effort gratis and they should be encouraged at every opportunity.

I shall discuss, first, certain impressions which have been obtained. It is an outstanding observation that physicians everywhere, especially general practitioners, are eager to learn. They travel long distances to attend meetings, postgraduate courses and clinics. They read the journals and can ask embarrassing questions. They appreciate the information obtained from the Packet of the Month. They appreciate the excellence of our sectional and state meetings and many of them attend meetings of the national societies and sit for hours to learn of the latest procedures. It is therefore clear that postgraduate instruction of all types should be continued and, if possible, expanded even during the war period. I believe we should follow the principle of having postgraduate education provided almost entirely by facilities within the state in order that it may be on a permanent and continuing basis. It is possible that the staff of every larger hospital of the state can arrange for at least a few clinic days during the year. Undoubtedly the education of specialists will suffer during the war because it will not be possible for so many of our physicians, except those physically disqualified for military service, to spend three years or more in graduate work, and for this reason again postgraduate education should be encouraged.

I have, of course, found that physicians are concerned and perplexed with respect to the workings of the Procurement and Assignment Service and the advisability of applying for commissions. During the year the situation with respect to the supply of physicians to the various services has become clarified and we now know where we stand. We at last realize that the situation is exceedingly serious and that both voluntary enlistment and recruiting through Procurement and Assignment are absolutely necessary. The number of physicians needed is much larger than was anticipated. Approximately twenty thousand physicians are in the various services now and it is estimated that three thousand a month will be needed in the future. By 1943 there should be forty thousand physicians in the various services. There are about 180,000 physicians in the country of whom probably 160,000 are active. This

Presented at the eighty-ninth annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 28, 1942.

means that by next January one doctor out of every five will be in service; in other words, there will be one physician in service for every four at home. It also means that more than half, possibly two-thirds, of those who are physically qualified and less than forty-five years of age will be in service.

Recently medical recruiting offices have been set up near the offices of the state medical associations to work in conjunction with the Procurement and Assignment Service. These recruiting offices select physicians who have volunteered through Procurement and Assignment and pass upon their qualifications. The names of qualified physicians are submitted to the Procurement and Assignment Service for determination as to whether or not they are regarded as essential men in their communities. The recruiting boards pass on the qualifications of the volunteers but their availability is decided by the Procurement and Assignment Service. The activities of the medical recruiting offices, with elimination of red tape, have speeded up the commissioning of physicians for the Army. Minnesota has done well—more than 500 of our 3,000 active physicians are in service. However, in spite of the activities of the Procurement and Assignment Service and the medical recruiting offices, more physicians are needed. No other profession or group has been given the privilege of selecting its own members for service, and if we desire to avoid dictatorial federal policies with respect to the recruitment of physicians, it is absolutely necessary that we do our part in making the Procurement and Assignment Service a success. This means that each physician who is physically qualified must seriously consider his own situation and decide honestly and patriotically his duty in the circumstances. If Procurement and Assignment fails the proponents of state medicine will have a pretty feather in their cap.

Another observation of an interesting and somewhat amusing nature concerns itself with the attitude of older physicians in relation to the war effort. Older men resent not being able to go into service. Physicians less than thirty-seven years of age are wanted. Those less than forty-five will be accepted and given commissions. But only in instances of most unusual special qualifications will men more than fifty-five years of age be accepted at all. Yet the older physicians are most patriotic and it is difficult to convince them

that they should not be accepted for commissions. Nevertheless, the older physician, who in many instances thought that he was of no more use in the world, suddenly has come to realize that he is a very valuable and necessary asset, that he can return to practice if he has retired, that he can take on the teaching position of a younger man, that he can again expand his practice, and the psychologic effect of all this is resulting in an improvement in health. Dr. Lahey at the recent meeting of the American Medical Association stated that he was happy to say that in spite of his strenuous year as president he was in better health than formerly. I wonder if the incidence of coronary occlusion and other serious vascular disease among older physicians will be reduced in spite of increased activity during the period of the war. If so, a new treatment for age has been discovered! Let us then propose a toast to the continued health and activity of our older physicians. They will do more for the country in civilian life than many a younger man.

Another topic of interest to the practitioner is the foreign graduate or so-called refugee physician. In this state refugee physicians have not been accepted by the State Board of Medical Examiners. The requirements for licensure are variable in the different states. The criteria set up by the Army Medical Corps for foreign graduates are rigid. A foreign graduate must be a citizen of the United States; he must have had a premedical education equal to that required for our approved medical schools; he must have a medical education of four academic years; he must be licensed in the country where his school is situated, and he must have had a year of internship; his qualifications must make him eligible to take the examination of the National Board of Medical Examiners and he must have a license to practice in the United States. Few foreign applicants can obtain evidence of these qualifications. No one can say at present whether the demand for physicians in civilian practice will make it necessary for the State Boards of Medical Examiners to revise their requirements or not. However, I am sure it is the sentiment of physicians in this state that as long as it is possible to do so our own physicians will make a very strenuous effort to take care of the civilian population.

Osteopaths have been accepted only as enlisted men but after training they may apply for service

in connection with hospital units but as enlisted men only. Congress made it permissible for the Army Medical Corps to accept osteopathic physicians, leaving the decision, however, in the hands of the Surgeon General, who for various well founded reasons has declined to give them commissions. Among other things, the Surgeon General states that he "is charged with the preservation of the physical well-being of the military forces and that this responsibility cannot be discharged in the absence of fixed standards of preventive measures, diagnostic procedures and curative therapy, and that these standards are found only in the school of regular medicine."

Next, I would like to discuss the situation of those of us who stay at home. We must of course care for the civilian population. This requires adjustment of our methods of practice, care of patients in areas where physicians are absent, elimination of inefficiency and useless waste, increased activity of older physicians, and return to practice of some of those who have retired. But it is self-evident that war is destructive; destructive of human lives, destructive of materials, of historical records, of art, of culture, of education. Yet the maintenance of as much culture as possible is essential—essential to recovery after the war. Consequently the duty of those of us who stay at home is clear. Outside of practice we must do our part to maintain the standards of medical education and, as far as possible, the standards of research. We must perfect the organization and coördination of all agencies concerned with health and medical care and even expand these activities where possible, looking forward to the necessities of peace. We must support in every way possible the colleges and universities, the medical schools, and scientific and humanitarian societies active in education and research. There can be no greater service than doing our part in maintaining the institutions and cultural activities of peace in order that there may be as sound a foundation as possible for recovery following the war. It is the history of war that that country recovers quickest and to the greatest degree, whose cultural foundation has not been destroyed and whose great men have not been throttled.

But these remarks are of a general nature. Is there anything more specific which should be proposed? We are expanding our campaigns in nutrition, vaccination and immunization, tuber-

culosis, child health and industrial health. Heart disease of children is under survey. Public health education is being carried on in an active manner. The medical setup for civilian defense is being organized slowly but satisfactorily. For the present it is recognized by those who are responsible that the most important portion of the civilian front is the industrial front and the problem of supplying medical care for both small and large industrial plants is being attacked vigorously. For the future it is clear that our greatest expansion should be in preventive medicine and in child health in coöperation with the State Board of Health and the Division of Social Welfare, that the next generation may be superior in every respect for reconstruction after the war.

Is there any other phase of medical care which should be studied? I have one concrete suggestion. For years the public and physicians have discussed the cost of medical care but, as far as I know, no state medical association has attacked the problem of useless waste in medical practice. Is it not timely when efficiency and economy are so necessary on account of war, to initiate a detailed study of this question and, when peace comes and the cost of medical care again becomes a major topic, to be prepared to provide a high standard of medical care at less expense, if possible, to hospital, physician and patient?

In looking over the literature on waste in medical care or, if you prefer, economy in medical care, I find many articles on hospitals—the folly of building overly expensive and ornate hospitals, the necessity of the utilization of a higher percentage of hospital beds, the need for studies in each community before enlarging hospital facilities, and numerous articles on the details of economy in hospital management. By marked contrast I find only two recent articles on waste and economy in medical care; one is entitled "Economy in Medication" and the other "Why Waste the Patient's Money on a Complete Blood Count?" It is clear that we need information on the useless tests which are being done in hospitals, partly because the chief may ask unexpectedly for a certain test which has not been obtained; also on the unnecessary and expensive prescribing of new and untried drugs, especially at this time, of vitamins, on waste in dressing room supplies, and the unnecessary duplication of various types of equipment. Recently at the meeting of the Minnesota Hospital Association I viewed an exhibit

on waste in hospital supplies. I cannot go into detail but damage to rubber, extension cords, burners, laundry, rugs, bedding, was demonstrated. It was shown that washed gauze is usable and less harsh than new gauze. Materials collected from laundry chutes were exhibited. In 1941 in one hospital more than 18,000 pieces of glassware were broken.

While the question of waste and economy in medical care has concerned me for a year or two, this exhibit focused attention on the subject again. I am sure that if such a study can be properly carried out many things of practical value to all of us will be disclosed. It will take at least a year or two of investigation and study. Our findings will necessitate later, if not now, a coördinated study by other groups: the university medical school, the hospital association, the nurses' association, and the pharmaceutical association. I grant that it will be difficult to find physicians qualified for such a task. Moreover, they would need assistance from laymen trained in efficiency and administration. It will be nec-

essary first to find an interested, willing and enthusiastic chairman and to give him the major responsibility of selecting the personnel of his committee and his assistants. I hope that this suggestion will be referred to the Council for their opinion.

And now I come to my valedictory. Although I am still granted six months of official life as your president, I shall have no other opportunity to express to you my deep appreciation of the honor you have conferred on me. My sense of appreciation is embellished by a firm conviction that the most gratifying factors in the life of a professional man are the companionship, tolerance and esteem of his fellow practitioners. As confrères, let us overlook each other's shortcomings and magnify each other's good qualities that we may work together to the honor and the progress of the medical profession. And in this war emergency, in the words of President Hutchins of the University of Chicago, "What can I do but ask you to lift up your hearts, and face the future with the fortitude becoming to educated men and women?"

SULFA DRUGS CAUSE THYROID ENLARGEMENT

Enlargement of the thyroid gland in the neck and a decrease in its activity are caused by the sulfa drugs, Dr. Julia B. Mackenzie and Dr. C. G. Mackenzie, of the Johns Hopkins School of Hygiene, have discovered in studies of rats, mice and dogs.

Sulfaguanidine, sulfadiazine, sulfapyridine and, to a lesser extent, sulfanilamide, all caused the thyroid gland enlargement. Another sulfur-containing chemical, thio-urea, had the same effect to an even greater degree. In the case of rats given sulfa drugs, the enlargement of the gland was accompanied by a decrease in its activity, as indicated by lowered basal metabolic rate.

The enlargement of the gland as a result of sulfa drugs was prevented by doses of thyroxin, the hormone produced by the gland. Iodine, however, which the gland requires for manufacture of its hormone, did not prevent the enlargement due to the sulfa drugs.

Whether the sulfa drugs prevent the formation of thyroxin by the gland or whether they destroy it after it has been produced is not yet known.—*Science News Letter*, April 25, 1942.

ARTHRITIS NOW LINKED TO RHEUMATIC FEVER

Evidence that chronic infectious arthritis in adults may have resulted from rheumatic fever in childhood was given the American Association of Pathologists and Bacteriologists by Dr. Archie H. Baggenstoss and Dr. Edward F. Rosenberg of the Mayo Clinic.

The two Mayo physicians felt that arthritis involves more than disease of the joints; that it involves the vital organs, the crippled joints being merely one expression of the malady.

They examined the organs of thirty patients who had had chronic infectious arthritis and found evidence of disease in the heart, kidneys, liver and other organs. There was damage to the heart in twenty-four cases and in sixteen of these the injury was indistinguishable from that caused by rheumatic fever. Also significant was the pathologic condition discovered in the kidneys. It was felt that heart and kidney damage was due to the same underlying set of causes.

Drs. Baggenstoss and Rosenberg concluded there may be a relationship between chronic infectious arthritis and rheumatic fever, typically a disease of childhood.—*Science News Letter*, April 25, 1942.

CLINICAL-PATHOLOGICAL CONFERENCE

MINNEAPOLIS GENERAL HOSPITAL

Frank C. Andrus, Pathologist

Presentation of a Case

DR. MOOSNICK: The case was that of a sixty-one-year-old white male who was admitted to the hospital on May 6, 1942, and who expired on May 28, 1942. The patient stated that he had had swelling of the abdomen and ankles for two weeks and had experienced epigastric pain and anorexia for the three weeks prior to admission. The epigastric disturbance was not severe but was annoying and came on shortly after eating. He thought that he received some relief by taking soda. He also experienced some difficulty in breathing. He said that his urine had become dark in color and he described it as bloody. There were no frank blood clots, however. He had no other genito-urinary symptoms. The past history was not remarkable except that the patient had drunk about one quart of whiskey each day for many years.

Physical examination at the time of admission to the hospital revealed a well-developed and well-nourished man. His blood pressure was 140/80. The abdomen was distended and a fluid wave was present. Several spider-web angiomas were present over the left upper chest and the left shoulder. The pupils were regular and even and reacted to light. The skin and sclerae were definitely icteric. Crepitant râles were heard over the bases of the lungs. The cardiac dullness was enlarged to the left on percussion. No other significant cardiac findings were noted. The ankles showed a one plus pitting edema. The impression at the time of admission was portal cirrhosis, with ascites.

Laboratory examination revealed the hemoglobin to be 68 per cent, the leukocyte count was 7,000, the average mean diameter of the red cells was 7.9 microns. The urine was dark brown in color and had a specific gravity of 1.027. It contained a faint trace of albumin, one plus urobilin and a trace of urobilinogen. There was no bilirubin in the urine. The blood urea nitrogen was 23 mg. per cent, cholesterol was 222 mg. per cent, the icterus index was 24. The direct immediate Van den Bergh was 4 plus and the direct delayed 3 plus. The plasma proteins were normal. The vitamin C level was .15 mg. per cent. Abdominal paracentesis was performed and two gallons of bloody fluid were removed. A bone marrow biopsy was performed but did not reveal any characteristic pattern. A barium enema examination revealed diverticulosis of the colon but was otherwise negative. Gastro-intestinal x-ray studies were likewise negative. The stools contained gross blood. A

peritoneoscopic examination was performed and tumor nodules were thought to have been seen on the peritoneum. The patient was placed on a high carbohydrate diet and given fluid and supportive treatment, but he did not respond well. He became stuporous and finally developed signs of hypostatic pneumonia and expired on the twenty-second hospital day.

DR. ADKINS: Was there much peripheral edema?

DR. MOOSNICK: The edema was minimal. The venous pressure was normal and after bed rest, the ankle edema disappeared completely.

DR. PEPPARD: After abdominal paracentesis, were there any special findings on palpation of the abdomen?

DR. MOOSNICK: The patient was rather obese and we were unable to make out any abdominal masses. Our clinical impression was cirrhosis of the liver and intra-abdominal malignancy, site of origin undetermined.

Autopsy Findings

DR. PAPERMASTER: Except for hypostatic pneumonia in both lungs, the anatomical findings of interest were limited to the abdomen. The liver weighed 3,150 grams, about twice normal weight. The external surface showed a portal cirrhosis and in addition, the liver was riddled with tumor nodules which varied in size up to about 20 cm. in diameter. The nodules were bright yellowish-green in color and had the characteristic appearance of a primary carcinoma of the liver. Only one small metastasis was found and that was in the subcutaneous tissue of the abdominal wall. We were unable to find the nodules on the peritoneum that the peritoneoscopist described. The cortices of the kidneys contained numerous small abscesses. The abdominal cavity contained about six liters of blood-tinged fluid.

DR. ANDRUS: The striking thing in this history is that here we have a chronic alcoholic who develops ascites and ankle edema with icterus. We were unable to explain the bloody abdominal fluid on the basis of uncomplicated portal cirrhosis. The microscopic sections of the liver revealed the characteristic changes of Laennec's cirrhosis. In addition there was a primary carcinoma of the liver of the hepatoma type. The tumor was extremely well differentiated and many of the

(Continued on Page 579)

HISTORY OF MEDICINE IN MINNESOTA

HISTORY OF THE MINNESOTA STATE MEDICAL SOCIETY

By **ARTHUR S. HAMILTON, M.D.**

Minneapolis, Minnesota

(Continued from June Issue.)

Twenty-third Annual Meeting

The twenty-third annual meeting of the Minnesota State Medical Society was held in Minneapolis June 17, 18, and 19, 1891. Dr. W. L. Beebe of St. Cloud, president, presiding. Several changes in the usual program for the work of the various sections were made and the usual roll call of members was omitted, a register book signed by members attending taking its place. For the first time since the Society was formed a member was expelled for advertising. A stenographer to report the discussions of the papers read was again to be hired and again a committee was appointed to revise the constitution. Twenty-five new members were admitted, bringing the number of active members to three hundred and eighty-four.

Doctor Beebe, in his inaugural address, did not, as was usual, review the advances in medicine during the past year but advised a more careful consideration and review of the papers to be presented. He also noted that medical colleges were now demanding more preparation on the part of students presented for admission and stressed the necessity of their action. With regard to the investigation of Professor Koch on tuberculosis he stated that although his claim of curing the disease with tuberculin has as yet not been established, his work had stimulated bacterial investigation to such an extent that no doubt many valuable results in the etiology and cure of infectious diseases were prone to follow.

The papers read at this meeting as a whole were of very high order. They were thoroughly discussed and in several instances the discussions were of great value. Most of the papers presented related to surgical aspects of diseased conditions except those of Doctor Spencer and Doctor Bean. The former discussed the clinical aspects of the newer findings of bacteriologists, a very logical discussion. The latter narrated his experiences with tuberculin. He said we are not justified in stating that Koch's treatment has been found inefficient both as a diagnostic and therapeutic means in tuberculous disease.

As a whole the papers read were much superior to those formerly presented and the discussions thorough and significant. Since surgery has advanced much more rapidly in the few previous years than medicine it is not surprising that medical aspects of disease were not much in evidence at this time.

Doctor Parks Ritchie of Saint Paul was elected president for the following year.

Twenty-fourth Annual Meeting

The twenty-fourth annual meeting of the Minnesota State Medical Society was held in Saint Paul, June 15, 16, and 17, 1892. The meeting was called to order by President Ritchie.

At this meeting the Society was incorporated. It was found that the society had been incorporated in 1869 but that the articles were never filed so that only those five members who signed the articles in 1869 were members of the Society as then formed. This was remedied by the new articles of incorporation. The constitution of the Society was again revised and considerable discussion of proposed amendments took place. The new constitution was printed with the transactions.

A resolution was presented by Dr. William Davis of Saint Paul authorizing the employment of attorneys to examine the laws of this and other states for the prosecution and punishment of the crime of abortion in order to see whether our laws relating to this crime could not be improved. The reason for the presentation of this resolution was that a Saint Paul physician had been convicted of the crime of abortion, the verdict, in the opinion of many, not being sustained by sufficient evidence. In our state, there was a special rule of evidence for cases where abortion is charged which did not exist in most of the states, the ordinary rules of evidence there prevailing. (See History of Medicine in Ramsey County previously presented.) This resolution, after some debate, was carried and the president appointed a committee of attorneys to examine the laws.

Dr. A. W. Abbott of Minneapolis was unanimously elected president for the ensuing year and thirty-four new members were admitted.

The president's address was largely concerned with the recent advances and activities of the Board of Health and the State Board of Medical Examiners and the recent interest throughout the country in the prophylaxis of tuberculosis.

The papers read at the meeting showed that the authors had thoroughly studied the subjects they presented. Various surgical aspects of gynecologic and surgical conditions were presented as well as the medico-legal aspects of court procedures. The papers were thoroughly discussed and it is evident that the reporter of the meeting was able to adequately transcribe the thoughts of the speakers. There were no pathological presentations and the materia medica section consisted of but one brief presentation. In the Section on Diseases of Children for the first time no mention was made of diphtheria. Most of the papers were presented by faculty members of the University staff.

Twenty-fifth Annual Meeting

The twenty-fifth annual meeting of the Minnesota State Medical Society was held in Minneapolis on June 21, 22, 23, 1893. The meeting was called to order by the president, Dr. A. W. Abbott of Minneapolis.

There is no mention in the minutes concerning the resolution regarding the changing of the law relating to the crime of abortion presented by Dr. Davis and passed at the previous meeting. The legislature of this year, however, passed a new law deleting the article relating to a special rule of evidence in such cases, which was a logical and necessary step. It was again found necessary at this time to revise to some extent the constitution of the Society and a committee was appointed to eliminate some of the articles that conflicted with others. The dues, which previously had been two dollars annually, were raised to three dollars because of the additional expenses to the Society. Twenty-nine new members were admitted at this meeting.

The address of the president was short. He stated that the progress of medicine and the elimination of irregular practitioners did not lie so much in the laws reg-

ulating medicine as in the scientific attitude of the practitioner. Medicine had become a science and the practitioner must practice it as a science. Quackery would eliminate itself if all kept up to date in the rapid progress of the Science of Medicine.

The surgical papers at this meeting were largely concerned with appendicitis as at this time the diagnosis was made early in the disease and the surgeon no longer waited 'til an abscess developed before operating.

A long symposium on chronic Bright's disease was also presented, the subject being thoroughly covered.

Hysteria in the Section on Nervous Diseases was also discussed and several papers relating to it were presented.

Dr. J. H. Dunn presented a long paper thoroughly discussing stricture of the urethra. The paper was so complete that there was little to discuss. Among men who previously have not presented papers at the state meeting and who later became prominent practitioners in the state one may mention H. Longstreet Taylor, Arnold Schwyzer, and Charles L. Greene.

It would be impossible and unnecessary to review all the papers presented. Surgery was the predominating subject but more well thought-out medical subjects were presented than hitherto. Gynecology and medico-legal subjects were also presented. Dr. W. J. Mayo of Rochester was elected president for the ensuing year.

Twenty-sixth Annual Meeting

The twenty-sixth annual meeting of the Minnesota State Medical Society was held in Saint Paul, June 20, 21, and 22, 1894. The president, Dr. W. J. Mayo, opened the meeting. Only seventeen new members were admitted.

There was little business before the Society. Money was appropriated to print a registry of physicians in Minnesota by the Board of Medical Examiners and the Board of Health and a resolution was adopted to prepare or select a series of tracts on the control of tuberculosis for distribution among the people.

Dr. Mayo, in his presidential address, reviewed the relations of the profession to other professions in the state, as well as our relation to the law and the status of the profession to malpractice, the coroner's office, and the commitment of the insane. The subject of the prophylaxis of tuberculosis was also touched upon. He made it plain that the public was now being aroused to the necessity for public action in this regard.

Thirty papers were presented at this meeting and for the first time physicians from without the state were invited to make presentations. Dr. Karl von Ruck of Ashville, North Carolina, spoke on "The Therapeutic Uses of the Pneumatic Cabinet" and Dr. E. C. Dudley of Chicago spoke on "Myomectomy as a Substitute for Hysterectomy." Sixteen of the papers were upon non-surgical subjects, showing that medicine at this time was making advances though it had been eclipsed by surgery in the last few years. For the first time in the history of the Society, a paper on cesarean section was presented by Dr. J. H. Dunn, who also presented "Observations on Appendicitis with a Brief Review of Thirty-eight Consecutive Cases."

Dr. W. T. English presented a paper on "The Parasitic Origin of Cancer" coming to the conclusion that the question of the parasitic origin was still debatable.

Dr. Justus Ohage of Saint Paul was elected president for the year 1895.

Twenty-seventh Annual Meeting

The twenty-seventh annual meeting of the Minnesota State Medical Society was held in Duluth, June 19, 20, and 21, 1895, Dr. Justus Ohage, president, in the chair.

The minutes of this meeting are more extensively recorded than any previous meeting but the business transactions were of little importance. The subject of the use of diphtheria antitoxin was discussed by Dr. A. E. Spalding of Luverne. He had used it in seven instances and stated that "these few cases are not sufficient proof as to the efficacy of the serum treatment. I cannot help but feel that in it we have reason to take courage in fighting one of the most fatal and treacherous diseases we are called upon to treat."

A considerable number of individual case reports were made at this meeting but there were but one or two interesting and thoughtful papers presented. A symposium on insanity and hospitals for insane patients was covered by several who presented papers. Dr. John T. Roger's paper "Ectopic Gestation with the Report of Sixteen Cases" and "The Modern Management of Simple Fractures" by Dr. J. H. Dunn were the best presented papers of the session.

On the last day of the meeting the members of the Society journeyed to West Superior where the Wisconsin State Medical Society was meeting.

Dr. Frank Allport of Minneapolis was elected president of the Society for the coming year and fifty-one new members were admitted.

Twenty-eighth Annual Meeting

The twenty-eighth annual meeting of the Minnesota State Medical Society was held in Minneapolis, June 17, 18, and 19, 1896. The president, Dr. Frank Allport of Minneapolis, opened the meeting. The minutes of the meeting are quite voluminous but there is little of interest as they deal largely with routine matters.

The committee appointed at the previous meeting to investigate the use of antitoxin in comparison with other treatments for diphtheria made an extensive report. The mortality rate of those treated with antitoxin out of 643 cases reported in Minnesota was 12.09 per cent; of those not treated with antitoxin the mortality was 16.17 per cent. This mortality rate of 12.09 per cent is much higher than it should have been but in reading further in the report we find that in practically all the cases so treated the antitoxin was used late in the disease and the amount varied from only 5 to 30 cubic centimeters. Apparently the profession had not as yet learned the proper use of the serum.

Dr. Allport's presidential address was a review and criticism of the law in Minnesota relating to the office of coroner. He believed that the medical profession should endeavor to have a law passed correcting the present ones.

Dr. C. G. Slagle of Minneapolis discussed the use of antitoxin in the treatment of diphtheria. This paper was largely made up of quotations from the symposium heard on the subject at the preceding meeting of the American Medical Association. Apparently but few of those present had used or had any clinical knowledge of antitoxin, as the discussion was brief.

Pierce Butler, then County Attorney of Ramsey County, addressed the Society on "The Medical Expert." This was the first time, according to available records, that anyone not a physician had been invited to participate in the program of the Society.

The Section on Gynecology presented a symposium on pus in the pelvis by Dr. Courtney of Brainerd, Dr. A. J. Mayo of Rochester, Drs. Abbott and Dunsmore of Minneapolis, and Dr. McLaren of Saint Paul. The subject was thoroughly covered.

Forty papers were presented at this meeting. Three of these were by speakers from Chicago and St. Louis. We note particularly a thesis on "The Management of the Senile Heart" by Dr. George Head, a very scholarly presentation. Dr. A. A. Law presented a short paper on "The X-ray." These three papers were the first on these subjects presented to the Society. Doctor Law took the first medical x-ray shadowgraphs in the state.

Dr. W. D. Flinn of Redwood Falls was selected as president for the coming year over Dr. W. H. Magie of Duluth by a close vote.

Twenty-five new members joined the Society this year.

Twenty-ninth Annual Meeting

The twenty-ninth annual meeting of the Minnesota State Medical Society was held at Mankato June 16, 17, and 18, 1897. Dr. W. D. Flinn, president, presided at the meeting and Dr. John F. Fulton of Saint Paul was elected president for the ensuing year. The minutes of the meeting are more voluminous than any previous meeting but are of no particular interest to us at this time. This meeting was not as largely attended as the three previous meetings.

The president's address dealt largely with progress made in the medical field, reduced mortality in diphtheria due to the use of antitoxin and the nationwide progress in efforts to eliminate tuberculous infection. Thirty-three new members were admitted to the Society and twenty-five papers were presented. The discussion of these papers were adequate.

Dr. Thomas McDavitt of Saint Paul presented "A Résumé of the Medical Legislation of the Past Year." A brief statement of the laws relating to medicine in forty-five of the states is given and those who may be interested in the status of medical licensure in the various states at this time may read it.

Dr. A. A. Law of Minneapolis read a paper on the utility of the x-ray in surgery, illustrating it with many shadowgraphs of patients of his own and of patients referred to him for diagnosis. The paper was an elaborate one and must have been of great interest to the audience for up to this time, perhaps, Doctor Law was the only physician using the x-ray as a diagnostic procedure. The other papers presented were on the whole excellent but short and the discussion of them as a rule longer than the papers themselves. Apparently Mankato was not a favorable locality for holding a meeting of the Society.

(To be continued in the August issue.)

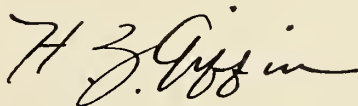

President's Letter

AN important conference was held in Cleveland on April 6, 1942. It was the first conference of its kind ever held in this country. Representatives of the American Medical Association and the American Pharmaceutical Association met to consider the relationship between medicine and pharmacy and to discuss the problems of each, and the principles of proper coöperation. Trends in pharmaceutical practice, the program of pharmaceutical education, and the relationship of both professions to the war and to civilian defense were the topics chiefly considered.

I believe we should all take cognizance of this movement to coördinate the activities of the two professions and in spite of the commercial appearance of the modern drug store, it should be clearly recognized that pharmacy is a profession with a code of ethics quite comparable to the code of ethics of medicine—in fact, that medicine and pharmacy are twin professions. Pharmaceutical education now has a cultural and scientific background. The pharmacist knows that education is a continuous process throughout life. He comes to realize that, as in medicine, service and the good of the patient are the primary considerations. Scientific advances vitally affect both professions. The physician cannot function without the pharmacist and the pharmacist cannot function without the physician. The two professions should coöperate as closely as possible. The physician should use the pharmacist as consultant and the pharmacist should utilize the physician as consultant. As far as possible, consultation should be on a personal basis in order to maintain mutual confidence and disseminate knowledge. In the modern type of drug store, drug clerks and salesmen should, above all others, be instructed to utilize the pharmacist as a consultant. It is estimated that two-thirds of the people rely on self-treatment. The layman frequently consults the druggist and pharmacist because of their accessibility. In this situation, the responsibility of the pharmacist is enormous, and in accepting this responsibility he should be well enough informed in the fundamental principles of therapeutics and public health to give suggestions and at the same time to know the proper limits of advice. With better coöperation in matters of public health the pharmacist can be a great help to physicians, to health departments, and to other agencies concerned in public welfare. I know that the physicians in this state are very much pleased with the activities of the State Pharmaceutical Association, especially, recently, with the way in which its members have assisted by means of window displays on nutrition, immunization and vaccination, cancer and tuberculosis. The pharmacist also becomes an important factor in the organization of civilian defense by reason of his knowledge, his contacts with the public, and his accessibility.

There is a constant pressure on the pharmacist who becomes proprietor to forget the ideals of pharmacy. The pharmacist works in an environment of commercialism and commercialization and must struggle to maintain his attitude as a professional man. It is absolutely necessary that physicians do all they can to counteract this influence and to assist the pharmacist in his efforts to keep pharmacy clean and progressive and on a professional basis.

I have suggested to the State Pharmaceutical Association at a recent meeting that a conference be arranged between representatives of the State Pharmaceutical Association and the State Medical Association, probably through the interprofessional relationship committee of each organization, in order that a set of principles and policies be outlined. The shortcomings of both the physician and the pharmacist, each in his relations with the other, can be considered and methods for their correction recommended. Movements for the promotion of public welfare can be sponsored and questions of medical and pharmaceutical education can be clarified. This should form a practical basis for active coöperation and mutual assistance.

Volume 25 JULY, 1942 Number 7

PROCUREMENT AND ASSIGNMENT COMMITTEE

LONG before war was declared the medical
profession took stock of its man power and
compiled voluntarily a very complete file of its
membership and the qualifications of each mem-
ber. In the event of war the profession would be
ready with the essential information to facilitate
the transfer of a considerable portion of the pro-
fession from civilian practice into the armed
forces.

To avoid a repetition of experience in World
War I, when unregulated voluntary enlistment
resulted in some physicians essential in their civil-
ian practice entering the service and others who
should have volunteered failing to do so, the pro-

fession offered to manage the gigantic under-
taking and procure the required number of men
for the government. A national committee of
physicians labeled the Committee on Procure-
ment and Assignment was appointed to accom-
plish what the name signifies. State and county
sub-committees of members of the profession
were appointed with the idea that local members
were best able to choose who among the local
membership were non-essential in their civilian
practice and were, therefore, available for serv-
ice.

Because voluntary enlistment in the Medical
Corps was not keeping up with requirements,
medical enlistment boards were established
throughout the country similar to the one in the
Lowry Building in Saint Paul, with authority to
grant commissions as lieutenants and captains
without delay. Letters were sent out to those
certified by local Procurement and Assignment
Committees as available, asking them to volun-
teer. Results in Minnesota, and apparently very
generally throughout the country, according to
McNutt's speech before the House of Delegates
of the A.M.A., have been disappointing, and a
little veiled threat was made by the speaker that
drafting of physicians might be necessary.

The mechanism for procuring the requisite
number of medical personnel by means of Pro-
curement and Assignment Committees has so
far failed. The reason was somewhat clarified
by the lively discussion which occurred at the
meeting of the House of Delegates June 28, fol-
lowing an address by Major Wood in charge of
the medical enlistment board in Saint Paul.

The local Procurement and Assignment Com-
mittees have simply certified the members in
their local societies who are non-essential in civil-
ian practice. These constitute a major portion,
in some instances at least, of the local county so-
ciety membership. If all so certified volunteered
the whole purpose of the establishment of these
committees would be nullified. The decision as
to who should and who should not volunteer is
still left to the individual. The difficulty of the
individual in deciding the question, and not neces-
sarily lack of patriotism, accounts for much of
the lagging in enlistment.

It has been suggested that Procurement and Assignment Committees establish quotas for all the states and sub-divisions, and each local committee with a definite quota to fill select those who can best be spared and bring pressure on them to enlist. If this method does not bring results, and we know that in certain individual instances it will not, the local committees are the logical agencies to designate to Uncle Sam who should be drafted. The medical profession has never been found lacking in patriotism and it can be expected that with specific quotas as objectives the profession will respond in sufficient numbers.

THE MEULENGRACHT DIET FOR BLEEDING PEPTIC ULCER

IT has been generally accepted for some years that the medical and not surgical treatment is best for bleeding peptic ulcer. A patient suffering from loss of blood is not a favorable operative risk and frequently the operative treatment is met with technical difficulties. So-called medical treatment with blood transfusion when necessary has proven highly satisfactory.

Medical treatment has been directed toward not disturbing clotting of the bleeding vessel. One procedure has been no food or drink of any kind for twenty-four or forty-eight hours, supplying needed fluid parenterally. This was on the assumption or hope that an empty stomach is lacking in peristalsis (something which has never been proven) and is slow in gastric secretion, although not free of hydrochloric acid.

Sippy's recommendation was the administration of milk on the hour and large doses of alkalis on the half hour for the purpose of neutralizing the stomach acid and thus preventing the digestion of the clot of the ulcer.

Several years ago Meulengracht¹ reported successful treatment of hematemesis and melena with food. His observations that sometimes such patients stopped bleeding when given food and that often ambulatory patients recovered from melena without making such change in their diets led him to try frequent feedings of a variety of foods in these cases. The patients were urged to eat as much and as frequently as they desired even on the first day of their bleeding, not only

bland food such as pureed vegetables, white bread and butter, rice and tapioca puddings, but also of meat balls, broiled chops, fish balls, apple sauce and stewed apricots with some alkali, belladonna and iron interspersed. Emphasis was laid on food and more food and not so much on alkalis.

In 1939 Meulengracht² further reported on his success with his rather bold innovation. In a series of 491 cases of "profusely bleeding ulcers" there were ten deaths, a mortality of about 2 per cent. One of these ten died following perforation and four died before they had time to eat. The mortality was admittedly low.

When confronted with a patient suffering from a bleeding peptic ulcer and vomiting blood, one might be excused from ordering a full meal and urging the patient to eat. You can lead a horse to water but you can't make him drink, and we suspect eating a full meal would be and was a physical impossibility for some of his patients. Nor do we see any advantage gained by the immediate administration of such a diet.

Meulengracht has, however, shown that food at frequent intervals is successful in the treatment of bleeding ulcers. Undoubtedly another contribution he has made which is fully as important is the confirmation of the idea that a more liberal diet in the treatment of ulcers in general promotes more rapid recovery. The early reliance on large amounts of alkali and greatly restricted diets over long periods of time undoubtedly has resulted in prolonged convalescence.

GOVERNMENT SAVINGS BONDS

FINANCING our war effort is one of the jobs which we have to handle on the home front. In addition to tax payments, this assignment calls for at least 10 per cent of all individual incomes to be invested in United States Savings Bonds.

Individual quotas can and must be met. Organizations and associations likewise are accepting their responsibility in the fiscal program. And the opportunity for sharing the load has been stepped up for all large investors whether they be individuals or groups.

The present limit of \$5,000 in individual hold-

ings of Series E Bonds purchased in any calendar year will continue. These are the "People's Bonds" which can be purchased only by individuals and may be registered in the names of one or two persons or in the name of one person with a second listed as beneficiary.

The Series E Bonds range in cost price from \$18.75 to \$750. At the end of ten years the smallest of this series pays back \$25 and the largest \$1,000. This is a return equivalent to an annual interest rate of 2.9 per cent. The Series F Bonds, like the Series E, are appreciation bonds. Unlike Series E, they may be bought by institutions and clubs. The smallest costs \$18.50 and pays back \$25 at the end of twelve years, the largest costs \$7,400 and pays \$10,000 at maturity, a return equal to a 2.53 annual interest rate. The Series G Bonds, unlike E and F, are current income bonds which are issued at par and draw interest of 2.5 per cent a year during their twelve-year maturity period.

The value in making a good investment of one's dollars would be reason enough to buy War Savings Bonds. But one can't forget the need for this money in our nation's fight for victory. Nor can one forget that putting money into bonds is one way in which each individual can help in the attack on inflation.

SPLINTING BEFORE TRANSPORTATION

EVERY city and township in the state that boasts an ambulance would do well to follow the example of Minneapolis by passing an ordinance requiring not only the carrying of arm and leg fracture splints, but also requiring that the driver or attendant of the ambulance know how to apply them.

The common sense of such an ordinance should be obvious to any layman but especially so to a physician. Careless handling of a broken extremity only adds to the seriousness of the injury. The acquiring of sufficient knowledge of how to apply a splint before transportation to a hospital is not difficult. The equipment of ambulances with splints is not an expensive proposition and would pay large dividends.

Dr. Roscoe C. Webb has been the chairman of the state committee on fractures for a number of years and it was through his efforts that the Min-

neapolis City Council finally passed the ordinance. The passage of similar ordinances in other localities will doubtless depend on the initiative of members of the medical profession in calling the matter to the attention of local authorities.

DILAUDID ADDICTION

OUR attention has been called to the fact that the Minnesota State Board of Medical Examiners has been forced to suspend or revoke the medical licenses of a half dozen physicians for addiction to dilaudid.

Dilaudid hydrochloride (dihydro-morphinone hydrochloride) is closely allied to morphine, both chemically and pharmacologically, having the same analgesic property and the same depressant action on the respiratory system. Its action on the intestine may be less marked than that of morphine. On the other hand the ratio between effective doses of morphine and dilaudid and toxic doses is about the same.

When dilaudid was first available to the profession, the impression was given that there need be little fear of its producing addiction. This is not true. In the experience of the Board of Medical Examiners addiction to dilaudid is even more difficult to overcome than addiction to morphine.

A word to the wise is sufficient.

HOSPITAL GROWTH TRIPLED OVER THIRTY-ONE YEAR AVERAGE

American hospitals grew three times as fast last year as during the previous thirty-one years, according to the twenty-first annual hospital survey of the Council on Medical Education and Hospitals of the American Medical Association.

For thirty-one years, the report says, the average net increase in hospital facilities was around 25,000 to 30,000 beds each year. The increase between the censuses of 1940 and 1941 was 98,136 beds, which is "astounding even for this unusual period."

This growth, the report continued, is equal to construction of one 269-bed hospital every day, Sundays and holidays included, for a year.

Total capacity of registered hospitals was 1,324,381 beds and 66,163 bassinets. There are 98,136 more beds and 4,224 more bassinets than a year ago; reports were received for 6,318 registered hospitals out of a total of 6,358.

Results of a survey in January of this year of blood and plasma banks in approved hospitals showed that 462 of 1,070 such hospitals either had one or the other of these facilities or were in the process of establishing them.

Two hundred and six hospitals maintain both blood and plasma banks, with seventeen others in the process of development. In addition, there are 171 hospitals operating plasma banks and thirty-three separate institutions with blood banks.—*Science News Letter*, April 25, 1942.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the

Minnesota State Medical Association
George Earl, M.D., Chairman

WARTIME MEETING AT ATLANTIC CITY

The war and its effect upon the practice of medicine occupied the time and attention of delegates to the American Medical Association to the virtual exclusion of all save routine business at the Atlantic City session.

Important conferences on medical insurance plans and on legal medicine provided opportunity for some discussion of vital social, economic and political problems but significant official action on such matters inevitably gave place on the floor of the House of Delegates to more pressing matters related to medical participation in the war.

Highlighted in the proceedings was the announcement by Paul V. McNutt, Director of Man Power, concerning the army's urgent need for physicians with the armed forces.

Medical Officers Needed

The original estimate of 25,000 needed by December 31 has been increased this year. Removal of this unprecedented number of men from civilian practice will entail new hardships for those who remain at home as well as for those who are forced to leave their practices to enter the service. Rigorous rationing of medical service to cover vital needs in industry and the health services, as well as in the civilian population, will undoubtedly be necessary and allocation of men from the Procurement and Assignment Service registry is expected to follow where it is necessary when military needs have been met.

Draft Threat

Minnesota's contribution of men to the Army, Navy and Marine Corps has been outstanding among the states but more are required and the clear implication of McNutt's address in Atlantic City was that exceptional methods will be used all over the country to induct younger physicians in-

to the service if voluntary applications fall short of the required number.

Those who wait for the draft or other compulsory methods may be commissioned in time but all authorities agree that they run the risk of indefinite delay after induction. Those who are classified in 1A, especially, face the possibility of being forced to give regular medical service as noncommissioned officers or privates. The Army is rolling up into a formidable impersonal machine in which there may be no consideration for the individual who has waited too long to apply for a commission.

The best advice obtainable is that all physicians who are 44 or under should be making plans now to enter the service. All will inevitably be in the fighting forces soon, according to official information on the subject, if the war effort continues on the present scale.

TWO-YEAR MEDICINE

The shortage of doctors for the military forces, obviously serious enough in itself, may have unforeseen repercussions.

There is a definite possibility that the government may undertake to establish its own schools of military medicine with courses limited to two years. The proposal was discussed in Congress recently by New York's Samuel Dickstein who, as sponsor in the House for the Army pay legislation, may be considered to have the ear of the War Department.

Congressman Dickstein proposed an abbreviated course with emphasis chiefly on military surgery, open to candidates with two years of pre-medical training, to be nominated, as candidates for West Point and Annapolis are now nominated by Congress. He envisioned nine of these schools, one for each corps area, which would turn out physicians rapidly and in large numbers. After the war is over, he proposed to use

these men for government services of all sorts including the Veterans' Administration, the United States Public Health Service and government health insurance services, if and when government health insurance becomes a fact.

Discrimination Charged

Justification for the bill would be the need for doctors in the Army which is not now being met by civilian physicians and also the social and racial discrimination which the Congressman charges against medical schools of the country. This discrimination has prevented hundreds of well-qualified students, in his opinion, from entering medicine.

The charge of discrimination made by Dickinson is obviously absurd; but the bill which he plans to sponsor should not be dismissed lightly by physicians and educators who have worked devotedly to bring standards of medicine to their present level in the United States.

Threat to Present Standards

Those who cherish our system of education and practice will undoubtedly do all in their power to see that urgent military needs are met among physicians who have qualified according to present high standards of training. Otherwise it is obvious that extraordinary methods will be taken and the presence of hundreds of half-trained men with commissions in the Army Medical Corps would virtually guarantee a new and regrettable era in post-war medicine in the United States.

A. M. A. CENSUS

Some interesting figures about the physicians of the United States have been secured as a result of the census taken by the American Medical Association's Committee on Medical preparedness.

These figures, some of them never available before, were reported by the committee in Atlantic City. About 158,000 out of the total 180,000 listed in the 1940 American Medical Directory, or approximately 86 per cent, filled out and returned the questionnaire. For the remaining 22,000 who failed to do so, incomplete schedules were filled out in the Bureau of Medical Economics or at the headquarters of state medical associations with all available information so that the punch

card file would contain at least a minimum of information about every physician in the United States.

It is obvious, of course, that deaths, changes of address and practice and new admissions make constant changes necessary and from the beginning of the census a routine has been established for making alterations as soon as information is received.

As a result of two years' effort, records and punch cards are now on file for more than 181,500 physicians in the United States and its outlying territories and possessions. Of this number some 176,000 are located in continental United States.

Specialists Outnumber General Practitioners

As of January 31, 1942, 85,964 of these were in general practice and 90,227 specialists (including those classified as fully qualified specialists devoting their full time to a specialty and physicians who devote only special attention or a part of their time to some special branch of medicine). The ratio of full-time specialists to special attention physicians is about 43 to 57.

The total number of physicians engaged in full-time appointments was found to be 7,216. Of these, 2,816 hold teaching appointments, 910 are engaged in full-time research work, 1,179 hold executive positions and 2,243 are engaged in full-time work in industry. Many of the latter are not actually caring for the sick or injured though they are contributing to the health of the industrial population.

In Government Service

The total numbers of physicians employed in some form of government service as of July, 1940, was 9,819, but this number is thought to have changed considerably in the last two years. In public health there were:—U. S. Public Health Service, 1,789; state health departments, 1,410; local health departments, 2,341; Veterans' Administration, 1,779; Indian Field Service, 910; other federal agencies, 2,293.

In hospital service there was a total of 16,457 physicians; in hospital administration, 3,089; as residents, assistant residents and fellows, 6,149, and as interns, 7,219.

Private Practice Leads

A total of about 142,700 physicians of all ages were classified as engaged in private practice. Among the total number in practice in the con-

continental United States, 164,488 were white male, 8,035 were white female, 3,362 were Negroes (both sexes) and 306 of other races.

In January, 1942, there were 42,721 physicians under 26 years of age in continental United States; 38,212 between 36 and 44 inclusive; 31,904 between 45 and 54 and 63,354 were 55 and older. There were 3,942 who were 80 or older, 255 who were 90 or over and exactly 6 who were 100 years or older.

Military Qualifications

Of the 112,800 physicians of military age, many, of course, cannot qualify for full military service and others cannot be spared since it is obvious that the 63,354 physicians who are 55 years of age and older cannot be expected to supply all of the medical services needed by the civilian and industrial population, even when reduced by the removal from the ordinary population of several million men in the armed forces.

Shortages

Among significant discoveries made on the basis of the census was the fact that the number of qualified physicians in certain specialties is so small that when military and civilian needs are considered there appears at once a serious problem in the equitable distribution of the available supply. Among these are neuro-surgery, plastic and maxillofacial surgery, orthopedic surgery, thoracic surgery, neurology, anesthesia, pathology, clinical pathology and bacteriology. There is likewise a serious problem, apparently, in the supply of qualified physicians for certain services in industry.

Used for Clearance

When the Procurement and Assignment Service was organized in October, 1941, the census material which had been arranged in listings was put to practical use in the clearance of physicians who had applied for commissions in the Medical Corps. The medical preparedness section of the Bureau of Medical Economics was designated as the Consultant Office of the Procurement and Assignment Service and, to date, 13,468 names have been cleared for commissions. Of these, 100 were Negro physicians and 1,753 were marked for assignment to the Air Corps.

Use of the census is being made now by several of the Medical Recruiting Boards set up recently to receive applications for commissions

in the Medical Corps and by state Procurement and Assignment Committees. It was also used to clear the names of 7,000 physicians in general practice and the specialties for the Selective Service System in connection with its program of rehabilitation.

MALPRACTICE AND DIAGNOSIS

From the address of Hubert Winston Smith, Associate in Medico-Legal Research, Harvard Law School and Harvard Medical School, on "Legal Responsibility for Negligent Diagnosis" delivered at the American Medical Association meeting at Atlantic City:

"It is my personal opinion that something like 70 per cent of all malpractice claims involve failure of the fact-finding function of the physician. Breach of the primary duty of investigation leads on to such secondary medical derelictions as improper treatment, injurious advice, failure to treat supervening complications, failure to give proper warning of special instructions to patients, nurse or interns, premature discharge of the patient, premature, delayed or unnecessary medical or surgical treatment and administration of contra-indicated anesthetics. . . .

"False Rumor"

"Recently, I noticed this statement in a medico-legal writing: 'Errors in diagnosis are errors in judgment and are not actionable, but errors of omission such as imperfect records, incorrect administration of treatment and so forth, are questionable and the final disposition of the case rests with the jury.'

"It would be a pity for this mistaken impression to gain credence and circulation among medical men. I shall try to clip the wings of such a false rumor before it flies too far. All negligence in medical practice can be analyzed functionally. We can truthfully say that such negligence always consists of a dereliction in discharge of the fact-finding function or of a dereliction in applying treatment. . . .

"Malpractice cases involving 'failure of the fact-finding function' have now come before appeal courts in England, the several dominions and all of the states in United States except Nevada and Delaware.

Should Take Inventory

"The practitioner should take an inventory of his own diagnostic qualifications in terms of the 'average level' or standard of medical practice in his own or similar localities. The following injunctions and suggestions may be worth noting:

1. Approach the identification of disease from the standpoint of differential diagnosis.

2. Offer a prayer when making a diagnosis but do not omit to take a history or to do a physical examination. Apply indicated procedures remembering that a trustworthy diagnosis should be established within a reasonable time.

3. Disclose the need for a consultant to the patient or the lack of proper instrumentalities. Association of a consultant is usually equivalent to reference when one doubts his own competency but need for special apparatus may call for prompt hospitalization.

4. Keep at least memorandum records.

5. If an independent technician is to be used constitute this person an employe of the patient by getting the latter's consent and by mentioning the fact that the fee is separate since the technician is not connected with the attending physician.

6. Pay just regard to the patients' own self-diagnosis, particularly diagnosis of pregnancy in a multiparous woman.

7. Confirm or refute diagnostic opinions of previous physicians but do not adopt them without independent examination.

8. Check x-ray films to see that they cover the area ordered photographed.

9. Do not destroy x-ray films or records; this creates an unfavorable impression in jury trials and may warrant an inference that the evidence was suppressed because favorable to the patient's contention.

"Remember that the duty of diagnosis is a continuing one calling for subsidiary surveillance throughout treatment and confirmation or discovery of complications. Reappraisal of the original diagnosis is called for when it is thrown into doubt by new facts reasonably discoverable in following the case.

"Remember, also, that even outstanding men may be derelict and jurors are not so tolerant of mistakes in diagnosis as of some other derelictions."

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

J. F. Du Bois, M.D., Secretary

Little Falls Quack Sentenced to 2½ Year Prison Term for Attempted Grand Larceny

Re: State of Minnesota vs. Stanley S. Piotrowski.

On June 18, 1942, Stanley S. Piotrowski, fifty-five years of age, 209 Third Street, Southwest, Little Falls, Minnesota, was sentenced by the Hon. Don M. Cameron, Judge of the District Court, to a term of up to two and one-half years at hard labor in the state prison at Stillwater. Piotrowski, who holds no license of any kind in Minnesota, nor elsewhere, had entered a plea of guilty to an information charging him with the crime of attempted grand larceny in the second degree. In sentencing the defendant, Judge Cameron referred to him as a "common imposter."

In a joint investigation made by County Attorney Austin L. Grimes of Morrison County, Sheriff Wm. J. Butcher of the same county and a representative of the Minnesota State Board of Medical Examiners, it was learned that the defendant had obtained various sums of money from a dozen families in Little Falls and nearby on his promise to cure a variety of ailments ranging from arthritis to cancer. The fees charged amounted to \$50 in some cases. For this the patient would receive some "medicine" prepared by Piotrowski under the name of the S. P. Glegonias Medicine Co. Piotrowski was arrested June 1, 1942, by Sheriff Butcher and upon being arraigned in Municipal Court before Judge Phil S. Randall, demanded a preliminary hearing which was set for June 18. Judge Randall fixed bail at \$2000.00 upon recommendation of County Attorney Grimes. The defendant was unable to raise the bail and he was ordered to jail. After two weeks in jail Piotrowski decided to plead guilty.

The investigation also disclosed that Piotrowski was arrested in Saginaw, Michigan, July 27, 1931, for vagrancy and received a 30-day sentence. On October 2, 1937, the defendant was sentenced to a six-month jail term at Stevens Point, Wisconsin, for practicing medicine without a license. The defendant stated he came to Little Falls in the fall of 1941 from Le Center, Minnesota, where he claimed he had worked on a farm. Piotrowski told the Court he had an eighth grade education and that his occupation was "farming."

The Minnesota State Board of Medical Examiners wishes to emphasize the splendid coöperation received from County Attorney Grimes and Sheriff Butcher in this case and others of a similar nature. This marks the third successive medical prosecution handled by them in the past two years in which cases all of the defendants were convicted and heavily fined or sent to prison.

TUBERCULOSIS IS AN OLD AND DANGEROUS ENEMY

It lies in wait particularly for the young adult, whose services today and after the war must be of supreme value to the nation. Tuberculosis always increases in wartime, and measures must be taken now if the increase that we may expect in the near future is to be stemmed. Existing tuberculosis services deal with those who have symptoms of disease, or who feel ill. A new advance is now needed. This means finding cases in which the disease has started, but not yet caused the patient to feel ill. Often nothing may be necessary other than careful watching; in some, short treatment is required, but in all cases there is better hope of eradicating the disease.—From *Bul. Nat'l Assn. Prev. Tuber.*, Eng., Jan. 11, 1942.

STALKING TUBERCULOSIS

The field of Industrial Medicine has in the last few years expanded rapidly. This expansion has been definitely exploited in the proceedings of the Fourth Annual Congress on Industrial Health, held in Chicago, January 12-13, 1942. This report comprises twenty-four separate papers dealing with subjects covering medical and surgical activities in industry, from "Traumatic Surgery" to the "Indiscriminate Administration of Vitamins to Workers in Industry."

There are many conditions and factors which constantly modify or influence Industrial Medicine. The Council on Industrial Health in 1940 stated that a properly administered health program should:

1. Prevent disease or injury in industry by the establishment of proper control over industrial environment;
2. Promote restoration to health and earning capacity as promptly as possible after industrial injury or disease;
3. Conserve the health of workmen through physical supervision and education."

"These are expressions concerning scopes and not of specific functions."

This program was constructed in peace times and primarily its object was to promote the physical welfare of every worker.

Now we are at war! Conditions have suddenly changed. Never before has the manpower of America been so carefully scrutinized. Never before have the local, state and national organizations interested in preventive medicine been more vigorous.

Mr. Paul V. McNutt, Federal Security Administrator, Washington, D. C., who addressed the House of Delegates at the American Medical Association, Atlantic City, June 8, 1942, stated, "We are now engaged in the total 'diagnosis' of America's manpower needs."

What are these needs? The answer is obvious—manifold! These needs must necessarily be considered in small groups or separately.

Among the many needs is the ever-present need of Tuberculosis case finding in all walks of life.

In a communication, dated June 20, 1942, from the Hennepin County Tuberculosis Association, I quote, "The most extensive Tuberculosis survey ever attempted is now being carried forward by the army and navy physicians who are x-raying for tuberculosis one-twenty-fifth of the entire population."

Tuberculosis must be kept out of the army and defense industries, not only in times of war, but also in times of peace. How can this be done? There is but one answer—universal registration by x-ray films.

The *Bulletin of the Hennepin County Medical Society*, February, 1942, carries a "Statement of Student Tuberculosis Survey," issued under the supervising committee of the Hennepin County Tuberculosis Association, which gives complete information regarding the study of tuberculosis among the 3,376 senior students to graduate in 1942. It is hoped parental consent will be unanimous and that every student will have the advantage of the portable x-ray unit with which the miniature film inspection of the chest is made.

The article entitled "Tuberculosis Case Finding in Defense Industries" is as follows:

A photofluorographic unit for tuberculosis case finding in war industries has been assigned to North Carolina. A second unit is now being prepared for service in New Jersey.

Requests for the use of these units should be made through the state division of industrial hygiene to the Division of Industrial Hygiene of the National Institute of Health, Bethesda, Md. A waiting list will be maintained at headquarters and requests filled in order of receipt, consideration being given to the impor-

tance and location of the industry making the request.

Personnel accompanying each unit includes a medical officer trained in interpreting 35 mm. films, a medical technician and a clerk. A portable condenser discharge x-ray machine has been added to the equipment, thus making it possible to obtain 35 mm. films in the absence of 400 milliamperes x-ray equipment. The U. S. Public Health Service will maintain the equipment and furnish x-ray films and developing supplies, repairs and replacements.

At the end of each survey of a particular industrial plant, a statistical and narrative report on the extent and result of the survey will be sent to the state health officer and plant medical director, after clearing the Division of Industrial Hygiene, National Institute of Health, and the States' Relations Division, U. S. Public Health Service. The films will be retained as permanent records in the Office of Tuberculosis Control of the Public Health Service. (Jour. A.M.A., June 13, 1942, page 568.)

In Rochester, New York, various authorities cooperating have set up a health project for the trainees attending vocational classes for war industries conducted by the Rochester Board of Health.

Full details of this interesting activity are incorporated in the paper entitled "Medical Aspects of Vocational and Industrial Training" by Dr. W. A. Sawyer (Fourth Annual Congress of Industrial Health). He states, "Following the medical examination, a preliminary rating is made in accordance with the following standards:

- I. In good physical condition—fit for any job.
- II. Having minor physical defects—fit for most jobs.
- III. Having major physical defects or conditions needing correction.
- IV. Having a disqualifying defect or physical condition which would be hazardous to the man or make it impossible for him to succeed at the job."

"Nine hundred and twenty-eight (33 per cent) were found to have positive tuberculin skin tests and were referred for chest x-ray examinations. Seventeen cases of tuberculosis were discovered, six of which were active."

From the above references and the wide sphere in which search for tuberculosis is being made, and the methods used, particularly the miniature x-ray film in civil, educational, army and navy activities, it would appear that the use of this type of apparatus under proper supervision would be the ideal method of examining industrial workers. It should be a part of the pre-employment examination as well as the periodic examination. It would appear also that under proper supervision that small industries could receive the benefit of such examination of their employes without great expense as well as larger industries.

It will be interesting to watch the result of the work being done in North Carolina and New Jersey which was quoted above.

Locally, should it be available, it would seem worth while to consider appropriating the idle x-ray unit of the Hennepin County Tuberculosis Association during the summer months for industrial tuberculosis survey.

ARCHA E. WILCOX, M.D.

CLINICAL-PATHOLOGICAL CONFERENCE

(Continued from Page 563)

nodules almost resembled the simple adenomas commonly found in portal cirrhosis. The tumor cells function, i.e., they produce bile. This is why the tumor tissue is greenish-yellow in color. Apparently the tumor arises in many places in the liver substance almost simultaneously.

There is still considerable controversy regarding the relation between chronic alcoholism and portal cirrhosis. The most common hepatic change in chronic alcoholics is a fatty liver. Most clinicians insist that most individuals who develop portal cirrhosis give a history of alcoholism but many pathologists take the opposite view. There is now some experimental evidence to indicate that there may be a relationship, for when depancreatized dogs are maintained with insulin they develop a fatty liver which may be depleted of its fat by the administration of lipocae. If this experiment is done repeatedly, the dog also develops portal cirrhosis. It is, of course, well known that portal cirrhosis is common in some parts of the world where alcoholic beverages are unknown. Almost invariably the liver, which develops a primary carcinoma, is a cirrhotic liver. The blood in the abdominal fluid probably came from necrotic tumor nodules which hemorrhaged.

Anatomical Diagnosis: (1) Portal cirrhosis; (2) primary carcinoma of the liver; (3) ascites; (4) bronchopneumonia.

PROCEEDINGS of the MINNESOTA ACADEMY OF MEDICINE

Meeting of May 13, 1942

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town & Country Club on Wednesday evening, May 13, 1942. Dinner was served at 7 o'clock and the meeting was called to order at 8 o'clock by the President, Dr. Martin Nordland.

There were 46 members and 1 guest present.

Minutes of the April meeting were read and approved.

There was no business, either new or old, to come before the Academy, so the scientific program followed immediately.

Dr. Erling W. Hansen, of Minneapolis, read his Inaugural thesis on the above subject. Lantern slides were shown.

EYE LESIONS IN LEUKEMIA

ERLING W. HANSEN, M.D.

Minneapolis

The first description of eye lesions in the leukemias was made eighty years ago. Since that time a number of papers have been written, mostly describing the fundus lesions found in isolated cases or in several cases. Most of the others deal with chloroma, an interesting though usually rapidly fatal form of myelogenous leukemia, characterized by greenish colored myeloblastic tumors having a special predilection for periosteum and bone, particularly the skull.

We have reviewed the eye findings recorded in 100 cases of leukemia seen at the University Hospital in the past five years. Our findings are only those recorded in the general examination of the patient, or in consultation reports of special examinations. On more than half of the 100 cases there were eye changes noted though no special study had been made of the patients for the express purpose of recording all eye changes. Some of the patients, especially the small children with acute leukemias, have no recorded eye examinations, probably because they were very acutely ill on admission and lived only a short time.

For this reason, no attempt has been made to give percentages of various lesions found. Borgeson and Wagener³ in 1929 reported the changes found in 138 cases at the Mayo Clinic, finding retinal changes in 70 per cent of the acute and 63 per cent of the chronic cases. They were present in 87 per cent of the myelogenous group and 34 per cent of the lymphogenous. They quote the statement by Foster Moore¹⁰ that few if any patients died of leukemia, lymphogenic or myelogenic, acute or chronic, without at some time showing ocular manifestations. The studies of Gibson⁶ would seem distinctly to indicate that the amount of retinal hemorrhage is dependent on the severity of the anemia

and not on the number of cells shown in the white count.

In this series there were twenty-nine cases of acute lymphogenous leukemias, six classed as subacute lymphogenous, and twenty-four chronic; seven acute myelogenous, two subacute and thirty chronic myelogenous. Two were classed as aleukemic lymphogenous leukemia. Of the acute lymphogenous, twenty-six were under fifteen years of age, the other three being nineteen, fifty-one, and fifty-nine. Of the subacute and chronic lymphogenous only three were under fifteen and eight under fifty years of age; leaving twenty-two cases over fifty. In the seven cases of the acute myelogenous group, the ages varied widely from three to sixty. In the subacute and chronic, four were under fifteen, the youngest four; three between twenty and thirty; four were thirty to forty; seven were forty to fifty; nine were fifty to sixty; five were sixty to seventy. An analysis of the pathology presented does not indicate there is any material difference in the findings from an age standpoint.

The pathology found in various parts of the eye and adnexa:

Lids.—Ptosis of one upper lid was seen in one chronic lymphogenous, one acute myelogenous; ptosis of both upper lids in one of the cases of aleukemic lymphogenous leukemia. Horner's syndrome was present in one case of acute myelogenous leukemia and in the aforementioned case of aleukemic lymphogenous leukemia. Edema or generalized infiltration of the eyelids was seen more often in acute lymphogenous leukemia, five cases, although it was also present in both acute and chronic myelogenous leukemia. One of the acute lymphogenous leukemias showed also a hematoma in one lid, and another purpuric spots. Distinct nodules were present in two cases of acute lymphogenous leukemia, one of acute myelogenous and one of chronic myelogenous. These nodules are more often found in lymphogenous leukemias, being classed as lymphomata such as occur in the skin. Mickulicz disease was the original diagnosis of one boy of four who had involvement of the lachrymal and parotid glands and testicles. This was proven to be acute lymphogenous leukemia.

Globe.—The conjunctiva was described as yellow or icteric in cases in each group. Subconjunctival hemorrhages were present in a small number in each of the acute and chronic lymphogenous and the acute myelogenous. Some degree of proptosis was present in two cases of acute myelogenous and one of chronic myelogenous leukemia.

Leukemic growths are a not uncommon cause of proptosis, occurring unilaterally or bilaterally. O'Brien and Leinfelder¹¹ at Iowa City studied eighty-two con-

secutive cases of unilateral exophthalmus, thirty-one inflammatory and fifty-one noninflammatory. Of the latter, seven were due to leukemic tumors. Many of the tumors originate in the region of the lacrimal gland, and may therefore be confused with lacrimal tumors, though they are more often more or less fixed to the periosteum of the orbit. The most typical of these tumors is chloroma, occurring most frequently in children, especially males. As mentioned before, there seems to be a special predilection for the skull, though invading also frequently the sternum, ribs and pelvic bones.

Allison¹ in 1924 reported a case of a three-year-old with nodular growths from the outer canthus of both eyes temporally, with rounded areas over the entire cranium. Incidentally, the early symptoms in this case were painful swelling of the ankles, knees, wrists, which is often a prominent symptom of leukemia in children. Gump, Hester and Lohr⁸ in 1936 reported a case of a man of fifty-five with progressive exophthalmus in both eyes, and a palpable tumor in the orbit below and temporal to the globe, on whom a diagnosis of monocytic chloroma was made. Here, on autopsy, a large tumor was found attached to each globe on the posterior wall, the optic nerve bisecting the tissue. Frost⁹ in 1937 reported a case of a four-year-old boy with a tumor attached to the roof of the left orbit, with a small one in the same position in the right orbit. The tumor from the left eye was removed and showed a dirty green color. Frozen sections helped to establish the diagnosis of chloroma. Blood studies then showed the presence of myelogenous leukemia. Together these papers give a very complete review of the subject of chloroma, with references. A very complete earlier bibliography is given by Bedell² in reporting four cases. I quote from Ernestine Kandel³ in regard to the association of myelogenous leukemia and chloroma "With recent improvements in staining technique and better differentiation of the acute lymphoid myeloid leukemias, almost all the recent cases of chloroma have been reported as cases of myeloid leukemia, several standard texts to the contrary.

"The inevitable association of chloroma with myeloid leukemia should make it obvious that chloroma is simply a variant of myeloid leukemia with the multipotential myeloblast assuming the distinctive role as type cell of an invasive neoplasm."

It was one of these cases coming to the University Hospital that prompted this study.

The case mentioned above was a boy of three, a patient of Dr. Carl Larson first seen at the University Hospital on May 18, 1939. He had been seen by Dr. Frank Burch in consultation. Dr. Burch has told me that chloroma was suspected. The presenting complaint was protrusion of the left eye. One month before admission the parents had noted a "squint" in the left eye. Two weeks later the left eye began to swell and appear more prominent. There were no other complaints.

Examination showed exophthalmus of the left eye, which was displaced downward and slightly inward, with marked limitation of movement laterally and

downward, and no upward rotation. The skin of the upper lid was thickened and red with prominently dilated veins. A firm nodular mass was palpable below the upper orbital rim.

Fundus examination of this eye showed congestion and tortuosity of veins, an elevation of the optic disc of 2 to 4 diopters, and a detachment of the upper portion of the retina extending down to the optic disc. The right eye was normal except for almost complete absence of pupillary reflex to light.

General examination was negative except for findings of palpable liver and spleen, both about two fingers below the costal margin in the corresponding midclavicular line.

The blood picture showed hgb. 54 per cent, erythrocytes 3,200,000; leukocytes 16,400; neutrophils 53 per cent, lymphocytes 42 per cent, monocytes 3 per cent, eosinophiles 1 per cent, basophiles 1 per cent. Subsequent smears showed increasing numbers of myeloblasts and leukoblasts, promyelocytes and basket cells. Two punctures of sternal bone marrow showed acute or subacute myelogenous leukemic changes.

X-rays of the skull revealed no bone destruction around the orbits. Sutures appeared to be slightly separated and convolutional markings increased, suggesting there might be some increased intracranial pressure. There was evidence of a soft tissue mass filling the left orbit. From May 23 through 31, deep x-ray therapy was used on the left orbit with regression of the tumor mass. On May 29 a firm, somewhat tender swelling appeared over the right mandible which increased rather rapidly in size and was also treated by deep x-ray. Roentgenograms showed a considerable destructive process through the mandible on both sides with large cystic areas of rarefaction, probably due to leukemic infiltration.

Blood transfusions of 200, 250 and 200 c.c. of citrated blood were given on May 25 and 26 and on June 4. This raised the hemoglobin but the blood picture remained much the same.

The patient was discharged to the parents June 9 and died on June 10. No autopsy was done.

This is clinically a case of chloroma, although technically that diagnosis cannot be made unless the typical greenish color of the tumor masses is actually seen. The other findings permit our calling it by that name, the significant findings being the orbital tumor causing proptosis of the globe, myelogenous leukemia shown in the blood and bone marrow smears, the invasion of bone, seen in the mandibles, the response to x-ray therapy and the rapidly fatal termination, about seven weeks from the first symptom of squint noted by the parents.

Iris and pupils.—Only two cases, a woman of sixty-six with chronic myelogenous leukemia and a boy of three with acute myelogenous leukemia showed absence of pupillary reaction to light. None had iritis or noticeable infiltration of the iris tissue. Goldbach⁷ analyzed 239 case histories of leukemia at Johns Hopkins Hospital and found pupillary changes in four each of acute and chronic lymphogenous leukemia, three in acute myelogenous leukemia and nine in chronic myelogenous leukemia.

kemia. There was iritis in three of the chronic lymphogenous cases in his series.

Retinal Vessels.—The most marked and constant finding in the vessels is engorgement of the veins with or without tortuosity. In this series this was slightly more marked in the chronic lymphogenous group than in the others. In two of the acute lymphogenous cases there was a noticeably lighter color to the blood. This, in some cases with high cell counts, is rather a striking feature. In some cases, mostly chronic myelogenous, white lines outline the distended veins, perivascular cellular infiltration. In one case of chronic lymphogenous leukemia there was thrombosis of the central vein.

Retinal Hemorrhages and Exudates.—Hemorrhages in the retina, of various size and shape, linear, flame shaped, small or large round hemorrhagic areas are common. It is not strange that retinal hemorrhages are common. Bleeding from the nose, uterus, bowel and kidney and under the skin are prominent early features of leukemia. Characteristic of some of the leukemic retinal hemorrhages are the white centers composed of accumulations of cells surrounded by the red ring of hemorrhage. Borgeson and Wagener felt that in lymphogenous leukemias, the occurrence of retinal hemorrhage may be taken as an indication of a tendency to occurrence of hemorrhages in other tissues. In myelogenous leukemia, retinal hemorrhages do not seem to have the same significance with regard to hemorrhages elsewhere. One of the striking fundus pictures seen in leukemias is that of large preretinal or subhyaloid hemorrhage, seen most often in the macular region. Numerous observers have included preretinal hemorrhage in their findings. In the present series this occurred in five cases, one acute lymphogenous leukemia, one chronic lymphogenous leukemia, two acute myelogenous leukemias and one chronic lymphogenous leukemia. In the acute lymphogenous case, a girl of eight, the eye grounds were watched from February 8 to the time of death on April 29. Original examination showed the veins markedly engorged and tortuous, many small flame-shaped hemorrhages over both fundi, with some more deeply placed round hemorrhages. There was a large preretinal hemorrhage, temporally, in the right eye and in the left eye one nasal and one temporal to the disc. A week later there had been marked absorption of blood, four small hemorrhages appearing on the disc. During the time of observation the hemorrhages could be seen to disappear without leaving a trace, while new ones appeared constantly. We have seen one case of chronic lymphogenous leukemia in which the original symptom bringing the patient for medical attention was loss of central vision due to preretinal hemorrhage.

Exudates seen were not peculiar to leukemia, some being so-called cotton wool patches and others more waxy in appearance, similar to those seen in diabetic patients. There was no preponderance in any one type of case, occurring in one patient of seventeen years, with subacute lymphogenous leukemia, two aged twenty-five and sixty-seven with chronic myelogenous leukemia, one

chronic lymphogenous leukemia, aged fifty-seven, and one acute lymphogenous leukemia, aged fifty-one.

Retinal Changes.—Pallor of the retina was noted in five cases—three of which were in children with acute lymphogenous leukemia, ages two, two and eleven. Moore has reserved the term leukemic retinitis for those cases with a pale or greenish reflex due to leukemic infiltration. Detachment of the retina was seen in one case of chronic lymphogenous leukemia, aged fifty-nine, and in the previously mentioned boy with acute myelogenous leukemia.

Optic Nerve.—While there were several cases recorded as having blurred disc margins, in only one case was there enough elevation to designate it as papilledema. One man of seventy-six with chronic lymphogenous leukemia showed marked pallor of the disc and one woman of 50 with chronic myelogenous leukemia was diagnosed as having optic atrophy. Several of the cases showed some paleness of the disc with other findings such as hemorrhages, without any infiltration of the retina, such a picture as one might see in severe anemias.

Summarizing, the eye lesions encountered in 100 cases of leukemia of all types showed little that would help to differentiate one type from another. Enumerating the lesions in the lids, we find hemorrhages, localized accumulations of leukemic cells both in the lid structure and the lacrimal glands. There may be edema of the lids causing a pseudo-ptosis or true ptosis, or narrowing of lid slits with other manifestations of Horner's syndrome. The globe may be proptosed by tumor formations in the orbit such as lymphomata and chloromata. The conjunctiva may show hemorrhage, an icteric tinge, with or without infiltration of cells. The pupils may show absence of reaction. Fundus examination may reveal a pale or yellowish green background, due to infiltration of the retina with leukemic cells. Detachment of the retina may occur. The veins are often engorged and tortuous, and in some instances the vessels may show white streaks sheathing them. There may be thrombosis of the central vein. One of the most constant findings is hemorrhage in the retina which may take place at various depths or may be massive into the subhyaloid space or actually into the vitreous. Retinal hemorrhages are sometimes characterized by white or yellow centers with red borders. The optic disc may show pallor of anemia, papilledema or atrophy.

Conclusion.—While leukemia is invariably a fatal disease, early recognition may be the means of prolonging life by such treatment as has shown some effect on the course of the disease. The first signs may be related to the eyes so we should be on the alert to recognize lesions which might lead to diagnosis and prognosis in the case of these unfortunate patients.

Discussion

Dr. R. G. ALLISON, Minneapolis: Dr. Hansen was good enough to mention the case of chloroma which I reported some twenty years ago. This was a little girl whom the late Dr. Wm. Murray was called to see on the North Shore on a fishing trip. He recognized the case of clinical chloroma and brought the child into the University hospital for teaching purposes.

We x-rayed the skull and the long bones of the skeleton. The findings in the long bones were those of a proliferative periosteitis, the new bone being laid down at right angles to the shaft. In fact, any of the bones seen singly would be characteristic of a primary periosteal sarcoma.

I reviewed the literature at that time and found there were no bone findings in chloroma. Since that time, Le-wald of St. Luke's Hospital in New York has reported two cases and Sherwood Moore of St. Louis has reported two additional cases. All of these cases, however, showed different bone findings; so, while bone findings do occur in chloroma, they are certainly not characteristic of the disease.

Dr. Hansen spoke of some of these cases showing widening of the suture lines and lack of closure of the fontanel. I think, as we x-ray more normal skulls, we realize that there is a great variation among the normal cases and consequently it is rather difficult to draw any conclusions from these findings.

I have had two very interesting cases where the eye condition was incidental to the general condition which was recognized beforehand.

Several years ago we had a young boy sent in to us for a chest x-ray. We found a large mediastinal mass which we thought represented Hodgkin's disease or lymphosarcoma. Biopsy of the cervical gland showed typical Hodgkin's disease. The mass was extremely sensitive to radiation and rapidly disappeared. Several days later the boy began to develop localized masses under his scalp. These were about the size of a large lima bean. They were extremely sensitive to radiation and disappeared within twenty-four hours under very slight dosage. Daily blood counts were done on this boy and the blood showed an essentially normal picture. About three weeks later he developed a mass in the conjunctiva which looked like a metastatic tumor. I called Dr. Frank Burch and asked him if Hodgkin's disease ever metastasized to the eye. He answered "No, but lymphatic leukemia does." Within a few days the blood showed the typical picture of an acute lymphatic leukemia.

Several years later, a surgeon referred me an elderly man who had had a biopsy of the cervical gland done at the Mayo Clinic and a diagnosis was made of Hodgkin's disease. He also had mediastinal involvement. We treated both the cervical area and the mediastinum, and the involvement disappeared.

Several years later the man came in to see me with a lesion in his conjunctiva. I sent him back to his referring surgeon for a blood count and he reported to me that the man's blood showed a typical picture of lymphatic leukemia.

I think Dr. Hansen is right about small doses of radiation handling these cases extremely well. We have certainly not found it necessary to employ large doses. Almost invariably they die later of Hodgkin's disease or lymphatic leukemia.

Dr. H. Z. GIFFIN, Rochester: Dr. Benedict expected to be here tonight to hear Dr. Hansen's paper and to discuss it. At the last minute it was found that he could not come.

I am interested in comparing Dr. Hansen's conclusions with those published by Borgeson and Wagener in 1929. At that time it was concluded that retinal lesions were more common in the acute cases than in the chronic cases, and much more common in the myelogenous type of leukemia than in the lymphocytic type. Dr. Hansen agrees that retinal lesions are much more common in the acute cases. However, he finds that lesions are more common in the lymphocytic type than did Borgeson and Wagener. The lesions described are similar in both reports, and all agree that in acute leukemia the retinal lesions are due mainly to anemia. Dr. Hansen finds visual disturbances more frequently than was thought to be the case at the time of the report of Borgeson and Wagener.

I should like to ask Dr. Hansen what percentage of cases in which he suspects leukemia from examination of the eyes prove to be leukemia, and I should like to have him say something more about other conditions in which ocular changes similar to those in leukemia occur.

Dr. W. E. CAMP, Minneapolis: I think Dr. Hansen has covered this subject so well there really is little to be said except to emphasize some of the things he has already mentioned. From the clinical standpoint, the infiltration of the conjunctiva extending up to the limbus and the infiltration of the orbital periosteum are the most important external phase of the disease. It is difficult to explain the sympathetic paralysis unless one figures that the cervical glands are involved by the leukemia, and give pressure on the sympathetic. Dr. Hansen has emphasized the hemorrhages and they are in direct proportion to the anemia and do not depend so much on leukocytosis. The choroid probably shows more infiltration than any of the other eye structures.

Dr. ALFRED HOFF, Saint Paul: Dr. Hansen has called attention to the value of fundus examination in general medical practice, especially in leukemia.

Regarding other diseases presenting changes in the ocular fundi, as discussed by Dr. Giffin, the following is worthy of comment.

A few years ago a man was admitted to the Ancker Hospital with a severe anemia, a high, basal metabolic rate, a palpable liver and spleen, and a soft diastolic murmur. A thyroidectomy had been performed elsewhere about six months previously without relief. He had no temperature except on the first day of his admission. His blood picture was not significant. The question arose as to whether or not this man had a subleukemic condition.

The ocular fundi disclosed numerous small hemorrhages throughout. In the left, there was a large hemorrhage superior and nasal to the disc. The oculist stated that these hemorrhages could be of leukemic origin.

A surprise finding of a subacute bacterial endocarditis was present at autopsy.

How much diagnostic value are we going to obtain from fundi examination in aleukemia and in such allied conditions as lymphosarcoma, especially of the bowels which may terminate in leukemic organ and lymph node infiltration without evidence in the peripheral blood of a leukemic state.

If eye ground changes occur sufficiently early or at all—such examinations might be extremely helpful espe-

cially in a large city hospital where the material is available.

I would like to have Dr. Hansen comment on this phase of the problem.

DR. HANSEN, in closing: The point Dr. Allison makes about the similarity of chloroma and Hodgkin's disease is well taken. I think that was a point which, as I went over this study, became more and more apparent—some of these cases came in as Hodgkin's disease or Mikulicz disease. Clinically they do more or less merge into each other and a fairly large percentage of cases actually do come into the leukemia group. Dr. Allison confirms the fact that the x-ray changes in the skull are pretty well recognized as not of pathognomonic significance in the leukemias.

Dr. Allison also spoke of lymphomas which develop on the conjunctiva—not an uncommon thing; yet in this series of over 100 cases there was not a single case of this type. They sometimes form a fairly large red, soft, fairly acute looking mass which gives on pressure. In some of the others, as we see in the lids and in the skin generally, nodules are quite firm even on the conjunctiva. This difference in consistency depends on the relative amount of fibrous tissue and cellular content. These are especially found in lymphogenous leukemia.

Answering Dr. Giffin's question in regard to percentages of cases suspected from the eye examinations, I don't believe we usually see them first although I mentioned one case with subhyeloid hemorrhages with several smaller hemorrhages, none of which was typical of leukemia, and which on examination proved to be lymphogenous leukemia. The boy I reported—I did not know Dr. Burch had seen him—was suspected of being a case of chloroma in the myelogenous group, though at first we had no such blood picture. That perhaps is one thing I did not stress enough, that we do have difficulties, in early diagnosis especially. We may have a picture of just an increased leukocyte count; there may be immature myelocytes; we may also have an aleukemic leukemia that complicates the picture a good deal. When it comes to actual percentages of diagnoses made from eye findings, I think they would be relatively small.

In the differential diagnosis we have, of course, similar hemorrhages in our vascular-renal disease, in hypertension, in diabetes or hemorrhages that occur in the severe anemias. We have similar hemorrhages occurring in all, depending on the depth in the retina, in which the hemorrhage occurs, linear or flame-shaped in the fiber layers, more round and variable in size in the deeper layers.

As far as exudates are concerned, there is nothing characteristic that we do not have in other diseases, so-called cotton wool and the harder ones such as are seen in diabetes. The only distinguishing characteristics in the fundus are the cellular infiltrations in the retina and in the choroid which give the peculiar greenish sheen to the backgrounds, and the hemorrhages with the white centers which you saw on the screen. In general, examinations of the eye grounds in these cases, or in any case, by the ophthalmologists can be of help in differentiating certain of these lesions, but not much more in the leukemias than those I have spoken of.

The meeting adjourned.

E. V. KENEFICK, M.D., *Secretary*

During the first two years of the war (England) deaths from tuberculosis increased in Glasgow about 41 per cent. The 1941 record shows no improvement. Overwork, strain, ill-spent leisure are thought to be responsible for the rise.—S. LAIDLAW, M.D., and D. MACFARLANE, M.D., *British Med. Jour.*, Sept., 1941.

FEDERAL ASSISTANCE IN CURBING PROSTITUTION

Federal action to help state authorities stamp out prostitution and its gangsters is meeting with general approval in the 27 counties of Tennessee where the May Act was invoked for the first time on May 21, Dr. Ray Lyman Wilbur, president of the American Social Hygiene Association, reported recently at a meeting of the Association's executive committee.

"The American Social Hygiene Association is studying the effects of and public reaction to the application of this new federal law," Dr. Wilbur said.

"Secretary of War Stimson decided to put the Act into effect in coöperation with state and local officials who had been unable to cope effectively with commercialized prostitution under war conditions and with limited laws.

"This Act now puts the challenge clearly before the people of the nation, as well as their federal and state governments, to make use of its authority in addition to already existing social, health and legal activities against prostitution and the venereal diseases. These evils are not problems for solution tomorrow. They must be dealt with today. Military discipline and moral discipline are both essential if we are to have a strong army. They must be maintained."

Newspapers in Nashville and Chattanooga have reported the favorable public sentiment concerning federal participation in curbing organized vice in the Camp Forrest area. The officials of some counties not included in the area are quoted as hoping that the Act will be extended to their counties.

The Nashville *Banner*, in an editorial, says: "The law abiding citizens of middle Tennessee welcome federal action to strengthen enforcement of vice laws. The area has been no exception to that general impact of degrading and demoralizing elements against which the May Anti-Prostitution Act is aimed. To meet such a condition as this requires just such concerted and determined action as now is promised. That action will have the backing of law abiding citizens everywhere."

The May Act, signed by the President, July 11, 1941, provides that it shall be unlawful to engage in prostitution or to aid or abet prostitution within such reasonable distance of any military or naval camp or station as the Secretaries of War or Navy shall determine to be needful to the efficiency, health, and welfare of the Army or Navy. The Act states that such practices shall be a federal offense punishable by a fine of not more than \$1,000, or by imprisonment for not more than one year, or by both. The Act further provides that within such designated areas, the Secretaries of War and Navy, and the Federal Security Administrator are authorized and directed to take such steps as they deem necessary to suppress and prevent prostitution, and to accept the coöperation of the authorities of the states and their counties.

OBESITY FROM GLAND INJURY

Injury to the hypophysis, small but important gland embedded beneath the brain, is capable of causing dwarfism and great bodily fatness, Dr. Albert W. Hetherington of Northwestern University Medical School told his colleagues. . . . His findings were based on experiments with rats, whose hypophyses were purposely injured by surgical means. The rats were subsequently killed and the glands microscopically examined. Five animals, in which the glands had been entirely destroyed, had developed as fat dwarfs; the remaining three, which had small fragments of their hypophyses, had developed normal body length, but these also were very fat.—*Science News Letter*, April 11, 1942.

REPORTS and ANNOUNCEMENTS

MEDICAL BROADCAST FOR JULY AND AUGUST

The Minnesota State Medical Association broadcasts weekly at 10:15 o'clock every Saturday morning over Station WCCO, Minneapolis, Station WLB, University of Minnesota. Speaker: William A. O'Brien, M.D., Director of Postgraduate Medical Education, Medical School, University of Minnesota.

July 4—Tetanus
July 11—Typhus Fever
July 18—Plague
July 25—Dental Disease

August 1—Dysentery
August 8—Whooping Cough
August 15—Chicken Pox
August 22—Rocky Mountain Spotted Fever
August 29—Diseases of Gums

A.M.A. MEETING

At the annual meeting of the American Medical Association held at Atlantic City, last month, Dr. Fred W. Rankin of Lexington, Kentucky, assumed the presidency and Dr. James E. Paullin of Atlanta, Georgia, was named president-elect. Dr. William J. Carrington of Atlantic City was elected first vice president; Dr. Olin West was reelected secretary and Dr. Herman Kretschmer of Chicago, treasurer. Dr. H. H. Shoulders of Nashville, Tennessee, was reelected speaker of the house and Dr. R. W. Fouts of Omaha, Nebraska, vice speaker.

New members of the Board of Trustees elected are: Dr. Edward L. Pallette of Los Angeles, Dr. Lloyd Nolan of Fairfield, Alabama.

The meeting in 1945 will be in New York City.

AMERICAN CONGRESS OF PHYSICAL THERAPY

The American Congress of Physical Therapy will hold its twenty-first annual scientific and clinical session September 9, 10, 11 and 12, 1942, inclusive, at the Hotel William Penn, Pittsburgh, Pa.

The annual instruction course will be held from 8:00 to 10:30 a.m., and from 1:00 to 2 p.m. during the days of September 9, 10 and 11 and will include a round-table discussion group from 9:00 to 10:30 a.m., Thursday, September 10.

The scientific and clinical sessions will be given on the remaining portions of these days and Saturday morning. A new feature will be an hour demonstra-

tion showing technique from 5:00 to 6:00 p.m. during the days of September 9, 10 and 11.

All of these sessions and the seminar will be open to the members of the regular medical profession and their qualified aids. For information concerning the seminar and program of the convention proper, address the American Congress of Physical Therapy, 30 North Michigan Avenue, Chicago, Illinois.

MEDICAL AND SURGICAL RELIEF COMMITTEE

The Medical and Surgical Relief Committee of America, with headquarters at 420 Lexington Avenue, New York City, has its state headquarters at the office of Dr. C. C. Kennedy, 807 Physicians and Surgeons Building, in Minneapolis.

The committee would appreciate donations of medical supplies, instruments, equipment or cash from physicians or the laity.

For further information regarding details or shipping instructions the following committee members may be consulted:

Minneapolis—Dr. Claude C. Kennedy; Dr. Owen D. Wangenstein, Dr. Gilbert Thomas.

Saint Paul—Dr. William R. McCarthy.

Rochester—Dr. Donald C. Balfour, Dr. Henry W. Meyerding.

Duluth—Dr. Arthur N. Collins.

Bemidji—Dr. Einar Johnson.

Crookston—Dr. J. F. Norman.

MINNESOTA STATE MEDICAL ASSOCIATION

Officers of the Minnesota State Medical Association elected to serve for the coming year at the meeting just closed in Duluth, include the following:

President—Stephen Baxter, Minneapolis

First Vice President—J. F. Norman, Crookston

Second Vice President—F. W. Lynch, Saint Paul

Secretary—B. B. Souster, Saint Paul

Treasurer—W. H. Condit, Minneapolis

Speaker of the House—W. W. Will, Bertha

Councilor, Fourth District—A. E. Sohmer, Mankato

Councilor, Sixth District—A. E. Cardle, Minneapolis

Councilor, Eighth District—W. L. Burnap, Fergus Falls

Delegates to American Medical Association—W. A. Coventry, Duluth, and A. W. Adson, Rochester.

Alternates—J. C. Hultkrans, Minneapolis and W. L. Burnap, Fergus Falls.

The 1943 meeting will be held in Minneapolis.

WOMAN'S AUXILIARY

Mrs. JOHN J. RYAN, *President*

Saint Paul, Minnesota

Mrs. L. R. BOIES, *Publicity Chairman*

Knollwood, Hopkins, Minnesota

County News

Mower.—The Mower County Auxiliary reports a profitable and pleasant year doing Red Cross sewing and knitting. At each meeting one member has led a discussion in some interesting subject.

On May 12, a dinner was held at the Fox Hotel in Austin in honor of the doctors. The welcome was given by Mrs. W. B. Grise and the response by Dr. J. G. W. Havens. Dr. Paul Leck, who was leaving for service in the air corps, and other doctors who expected to be called soon, were presented with gifts. Bridge followed the dinner.

The Auxiliary sponsored the appearance of Mrs. Rebecca Overmann, State Commander for the Control and Cure of Cancer, May 18. In addition to Mrs. Overmann's address, the film, "Choose to Live," was shown.

Stearns-Benton.—Stearns-Benton Medical Auxiliary recently held its annual meeting at Klock's Cafe in St. Cloud. Mrs. P. E. Barringer, retiring president, presided. Annual reports were given by officers and chairmen. Mrs. R. N. Jones was appointed delegate to the state convention in Duluth, with Mrs. Barringer the alternate.

The following officers were elected: Mrs. R. N. Jones, president; Mrs. William Friesleben, vice president; Mrs. John J. Gelz, secretary; Mrs. T. N. Fleming, corresponding secretary; Mrs. T. W. Hovorka, treasurer; Mrs. John B. Beuning, auditor; Mrs. J. P. McDowell, historian. Committees named were: finance, Mmes. Karl Walfred, M. J. Kern; membership, Mmes. L. M. Evans, S. J. Raetz, E. E. Keithohn; program, Mmes. J. B. Gaida, J. B. Beuning, C. A. Beuning, C. A. Rathbun; hospitality, Mrs. Jennie Hovorka; layette, Mmes. J. C. Buscher, Charles Donaldson; health and public relations, Mmes. J. P. McDowell, T. N. Fleming; publicity, Mmes. P. E. Barringer, William Friesleben; clipping, Mrs. W. W. Wenner, good cheer, Mrs. H. B. Clark.

Goodhue.—The Goodhue Medical Auxiliary puppet show on preventive medicine is consuming much time and interest of its members. To date, showings have been given at Hay Creek, Goodhue, Pine Island, Wamamingo, Kenyon, Cannon Falls rural community, and Cannon Falls high school. An exhibition is being prepared for the state meeting in Duluth.

The April meeting was held at the home of Mrs. J. Brusegard in Red Wing. The following nominating committee was appointed: Mmes. H. Claydon, R. Hedlin, and Nordholm.

In May eleven members were entertained at the home of Mrs. Russell Aanes in Ellsworth, Wisconsin.

Olmsted-Houston-Fillmore-Dodge.—At a recent Health Day Program given at Mayo Foundation House with the Altruistic Club of Rochester, the Olmsted-Houston-Fillmore-Dodge Medical Auxiliary gave some very worth-while facts on nutrition to club women attending.

Dr. R. M. Wilder, and Miss Mary Foley were the speakers.

According to Dr. Wilder, sugar rationing is one of the best health measures that could have been achieved for us and our families. Sugar is so highly refined that what vitamins or minerals may have been present in the cane or beet have been entirely removed. It only makes good foods more palatable. Bad foods have necessitated a nutritional program, and each one of us must make it our personal responsibility to know what kinds and amounts of food are needed for good health. The enrichment of breads and flours is valuable because of important vitamins added, and all women were urged to insist on these enriched products in order that they may be continued. Dr. Wilder scorned the use of soft drinks and candy bars by the public, particularly among children who consumed these products in place of milk and other foods valuable for vitamin, mineral, or iron content.

Miss Foley stressed the importance of developing sound food habits based on proven facts of nutrition and education, and being healthier as a result. She said that most individuals eat enough food from the caloric standpoint, but the food may be lacking in essentials that result in positive health. Milk, meat, vegetables, and fruits are desirable for proper diet. Good food information may be secured through the "Consumer's Guide."

Approximately 100 women attended the program which was followed by tea. Mrs. M. J. Anderson, Medical Auxiliary president, and Mrs. S. B. Shonyo, Altruistic Club president, poured.

At the May meeting of the Auxiliary held at the Mayo Foundation House, Mrs. H. L. Williams was elected president. Other officers elected were Mrs. John M. Waugh, vice president, and Mrs. T. L. Pool, secretary-treasurer. Dr. Jorge de C. Barbosa, a fellow in the Mayo Foundation, gave a talk on his native Brazil.

St. Louis.—Mrs. John J. Ryan, president of the State Auxiliary, was the guest of honor at the annual meeting of the St. Louis County Auxiliary held in Duluth, Tuesday, May 12. She came to confer with members on the State Auxiliary convention.

West Central.—A dinner meeting was held May 13 at Morris by the West Central Auxiliary. Mrs. John J. Ryan, state president, was the guest of Mrs. Allen.

Members of the Auxiliary to the State Medical Association extend to Mrs. John J. Ryan, president, their sincere sympathy in the recent death of her mother.

In Memoriam

Harley James Gunderson

Dr. H. J. Gunderson, formerly of Minneapolis, died at Los Angeles, May 27, 1942.

Dr. Gunderson was born in Sheboygan, Wisconsin, January 19, 1889, where he attended the public schools. He received his medical degree from Northwestern University in Chicago in 1911 and interned at Saint Elizabeth Hospital at Danville, Illinois.

Dr. Gunderson practiced in Minneapolis with his brother, Dr. Nels Gunderson, from 1912 until 1927, when he moved to California. During this period he took postgraduate work in Germany for a year and in China for six months.

He was a member of the American College of Surgeons and the Hennepin County Medical Society when he practiced in Minneapolis. He was also a Mason and for many years was on the staff of the Swedish Hospital in Minneapolis.

Dr. Gunderson is survived by his wife Winifred Coe Gunderson; his son, Harley J. Gunderson, Jr., who will graduate from the Medical School of the University of California in February, 1943; his father, Captain Nels A. Gunderson, of Sheboygan; a brother, Dr. Nels A. Gunderson, of Minneapolis; and a sister, Mabel Gunderson, of Sheboygan.

Philip Allen Halper

Dr. Philip A. Halper, a graduate of the University of Minnesota Medical School in 1923 and well known in the Twin Cities, died April 21, 1942, in Palm Springs, California, of hypertension, at the age of forty-four.

Dr. Halper interned at the Ancker Hospital, Saint Paul, and acted as assistant city and county physician in Saint Paul in 1924-25. He moved to Chicago and became associate ophthalmologist at the Illinois Eye and Ear Infirmary and later attending ophthalmologist at the Michael Reese Hospital and the Mandel Clinic.

Dr. Halper was a member of the American Academy of Ophthalmology and Otolaryngology, a fellow of the American College of Surgeons, a member of the American Board of Ophthalmology and the American Board of Otolaryngology, and an associate in his specialty at the University of Illinois College of Medicine. He was also an associate editor of the *Cyclopedia of Medicine*.

Edward Oscar Thorson

Dr. Edward O. Thorson of Luverne, Minnesota, died at the Luverne Hospital, May 27, 1942, at the age of sixty-seven years.

Dr. Thorson was born at Mount Horeb, Wisconsin, February 15, 1875. After attending public schools there he attended the Mount Horeb Academy for three years, enrolling at the age of fourteen. He clerked in a store in Madison, Wisconsin, for several years and then attended Bennett Medical College in Chicago where he graduated in 1906.

Dr. Thorson began practice at Colton, South Dakota.

JULY, 1942

SPENCER DESIGNERS HAVE NEVER USED RUBBER

EITHER TO MAKE A GARMENT FIT OR AS A MEANS OF SUPPORT!

Since the purpose of a surgical garment is to *support*—and rubber's purpose is to *yield* and *stretch*—rubber has no rightful place in a surgical support.

Under the smooth exterior of this Spencer Support Corset is concealed a simple abdominal supporting belt, adjustable at several different points from outside the corset. The only rubber used is in the small insets at hem to allow for spread of thighs when seated.

Hence Spencer Designers have never used rubber in designing the supporting sections of Spencer Supports. Only non-stretchable fabrics are used. Your patients receive today the *self-same* Spencer they always have.

We believe that where rubber is resorted to in order to make a corset fit, or to provide support or comfort, it is used as a *substitute for designing skill*. The Spencer theory of support, fit and comfort lies in *designing every garment individually for the wearer of non-stretchable fabric*. This assures your patient of . . .

The *precise design* of garment required for her figure and condition.

The exact degree of support needed.

Definite posture improvement.

Accuracy of fit, perfect comfort.

Because every Spencer is individually designed for the patient it can be—and IS—guaranteed to hold its original shape as long as it is worn. Ordinary supports soon stretch or otherwise lose their shape and become useless before worn out. Spencers are, to our knowledge, the only supports that carry a shape-keeping *guarantee*.

For service, look in telephone book under "Spencer Corsetiere" or write direct to us.

In August, 1908, he came to Luverne where he has since practiced.

Dr. Thorson was married in 1907 at Colton to Alma Kleven. After her death he married Laura Shutriet of Charles City, Iowa, in 1931.

Surviving him are his widow and three daughters: Mrs. Theodore Schoon, and Mrs. Jack Kent both of Luverne and Mrs. Ray Fisher of Sioux Falls.

Dr. Thorsen was a member of the Southwestern Minnesota Medical Society, the Minnesota State and American Medical Associations. He was also a Blue Lodge Mason of many years standing, being a member of the Ben Franklin Lodge No. 114 of Luverne.

According to those who knew him, Dr. Thorson, although quiet and unassuming in manner, inspired confidence and close friendships and his passing will create sincere sorrow in a wide circle throughout the country.

UNITED CHINA RELIEF

United China Relief's "unique experiment" in the use of 22 topflight industrial executives, who contributed their time and talents for a three month's period to organize the United China Relief national drive, has been "an unqualified success," Paul G. Hoffman, national chairman, declares in his first progress report to United China Relief committees throughout the country.

Mr. Hoffman reported that to date 1,815 cities had been organized for the drive, and among these, 109 cities had included United China Relief in their war chest and community chest campaigns. He revealed that although the national campaign was only well launched, total funds received to date aggregated \$3,500,000 and \$1,500,000 additional had been accepted in war chest and community chest quotas. He said that already 309 communities organized by United China Relief's "lend-lease" men had exceeded their quotas, having raised over \$1,000,000.

He attributed the general acceptance of quotas and the national support of the campaign in large part to "the great contribution made by industry in loaning us its executives." He added, "Their assignment to the United China Relief job represented a substantial sacrifice by their firms at a time when American industry is in a period of transition aimed at getting into high gear for maximum war production."

In summing up their achievement, Mr. Hoffman pointed out that the funds received so far are close to the total received last year and the number of communities taking part in the drive exceeds by a large number last year's list.

"The successful progress of the drive so far is particularly heartening because China's relief needs this year are more than double those of last year," Mr. Hoffman declared. "The fall of Malaya, Hongkong and Burma have sent back into China a pitiful horde of hundreds of thousands of refugees absolutely penniless and with only the clothes on their backs. What precious personal belongings they tried to bring with them have been stripped from them by rapacious Japanese sentries, and the hardships of their journey home have so weakened them that they are easy prey to disease."

The Leitz Clinical Photo-Electric Colorimeter

Here is an instrument that takes the personal equation out of colorimetry and reduces color matching to an exact science. The use of the photo-electric cell assures absolute accuracy on every reading.

No calculations are required. Each instrument is individually calibrated. The concentration of the unknown solution is obtained simply by reading the scale and taking the corresponding value from the table of calibrations which comes with each unit. This eliminates the necessity of preparing a chemical standard for each test, thus saving both time and materials.

Calibration tables and complete techniques are furnished for twenty determinations and additional calibrations may be secured if desired.

Effective, Convenient and Economical

THE effectiveness of Mercurochrome has been demonstrated by twenty years' extensive clinical use.

For the convenience of physicians Mercurochrome is supplied in four forms—Aqueous Solution for the treatment of wounds, Surgical Solution for preoperative skin disinfection, Tablets and Powder from which solutions of any desired concentration may readily be prepared.

Mercurochrome

(H. W. & D. Brand of dibrom-oxymercuri-fluorescein-sodium)

is economical because solutions may be dispensed at low cost. Stock solutions keep indefinitely.

Mercurochrome is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

ANNOUNCES CONTINUOUS COURSES

SURGERY—Two Weeks Intensive Course in Surgical Technique with practice on living tissue, every two weeks throughout the year. General Courses One, Two, Three and Six Months; Clinical Courses; Special Courses.

MEDICINE—Two Weeks Intensive Course will be offered starting October 5. Two Weeks Course in Gastro-Enterology will be offered starting October 19. Two Weeks Intensive Course in Electrocardiography and Heart Disease starting August 3.

FRACTURES & TRAUMATIC SURGERY—Two Weeks Intensive Course will be offered starting September 21. Informal Course available every week.

GYNECOLOGY—Two Weeks Intensive Course will be offered starting October 5. One Month Personal Course starting August 3. Clinical and Diagnostic Courses every week.

OBSTETRICS—Two Weeks Intensive Course will be offered starting September 21. Three Weeks Course starting August 10. Informal Course every week.

OTOLARYNGOLOGY—Two Weeks Intensive Course will be offered starting September 14. Clinical and Special Courses every week.

OPHTHALMOLOGY—Two Weeks Intensive Course will be offered starting September 28. Five Weeks Course in Refraction Methods starting October 19. Informal Course every week.

ROENTGENOLOGY—Courses in X-ray Interpretation, Fluoroscopy, Deep X-ray Therapy every week.

General, Intensive and Special Courses in All Branches of Medicine, Surgery and the Specialties.

TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL

Address: Registrar, 427 S. Honore St., Chicago, Ill.

and the ministry, Rev. Leeman was graduated from the General Theological Seminary in 1935 and then entered the University of Minnesota Medical School. For the past year he has served as resident physician of St. Luke's hospital in New York.

After a year as assistant rector of St. Peter's church in Port Chester, Rev. Leeman plans to go to the Orient as a medical missionary.

* * *

Married in Hibbing, June 6, were Miss Mary Katharine Bowen, daughter of Dr. and Mrs. R. L. Bowen of Hibbing, and Dr. A. Carlyle Tingdale, son of Dr. and Mrs. A. C. Tingdale, Sr., of Minneapolis.

Dr. and Mrs. Tingdale are at home in Hibbing where Dr. Tingdale is a member of the Mesaba Clinic staff. He is a graduate of the University of Minnesota School of Medicine.

Members of the bridal party included Dr. Harold Miller of Minneapolis, Dr. L. W. Johnsrud and Dr. Edward Zeman of Hibbing.

* * *

Two annual meetings of county Public Health Nursing Committees were addressed last month by Dr. W. A. O'Brien, director of postgraduate medical education at the University of Minnesota. On June 18 he spoke before the Pine County group at Pine City, and on June 23 before the Watonwan County committee at St. James.

Dr. O'Brien also was among the speakers at the special training course in building operation and maintenance held on the University of Minnesota campus June 15-19, for school custodians and engineers. His subjects were "First Aid in the Schools" and "The School Health Program."

* * *

Dr. Lawrence R. Boies of Minneapolis, director of the division of otolaryngology at the University of Minnesota Medical School, will address the meeting of the Medical Association of Montana in Missoula, July 8. His subject will be "Symptom of Headache."

At the meeting of the Montana Academy of Ophthalmology and Otolaryngology in Missoula the same week Dr. Boies will present two papers: "Problem of Hearing Impairment" and "Acute Frontal Sinusitis."

Dr. Boies also spoke at the recent annual meeting of the North Dakota Academy of Ophthalmology and Otolaryngology in Jamestown, May 19, on "The Problem of Deafness."

* * *

Under the accelerated program at the University of Minnesota Medical School, the "fall-quarter" freshman medical class began its work June 16 instead of September 28. All other medical students are continuing their studies throughout the summer.

The freshman class has been increased to its absolute maximum of 125, the highest number for which there is adequate facilities.

The accelerated program and the larger class enrollment is placing the heaviest teaching burden of all time on the medical school faculty. Due to the wa-

the faculty has lost many of its members, 85 of them having gone into active service with the army or navy, of June 1.

* * *

The Navy department at Washington has ordered the Medical Specialist Unit No. 56, formed at the Mayo Clinic in Rochester with Dr. Waltman Walters as organizer, to duty.

The unit, which was to leave about July 1, is the second of its kind to be called to duty from the Mayo Clinic. Its members are:

Commander Walters, surgery; Lieutenant Commander C. H. Watkins, medicine; Lieutenant Commander John D. Camp, radiology; Lieutenant R. W. Cragg, pathology; Lieutenant T. J. Hughes, otolaryngology; Lieutenant L. O. Underdahl, neurology; Lieutenant D. H. Pattison, urology; Lieutenant H. R. Butt, medicine; and Lieutenant M. B. Coventry, orthopedic surgery.

Drs. Walters, Watkins, Cragg and Butt are members of the Mayo Clinic staff, while the others are fellows of the Mayo Foundation.

* * *

In accordance with new army regulations reducing the size of the professional staff of general hospitals, 14 of the 55 medical officers of the United States General Hospital Unit No. 26 have been detached from the unit and transferred from Fort Sill, Oklahoma, to Camp Custer near Battle Creek, Michigan.

They are:

Medical Service: Stanley W. Lundblad, Captain, M.C.; Robert A. Green, First Lieutenant, M.C.; Frank Kiesler, First Lieutenant, M.C.; Rodney F. Sturley, First Lieutenant, M.C.

Surgical Service: Conrad J. Holmberg, Captain, M.C.; Howard Hall, First Lieutenant, M.C.; Richard Reiley, First Lieutenant, M.C.; Frederick B. Mears, First Lieutenant, M.C.

Laboratory Service: Evrel Larson, Captain, M.C.

Radiology Service: Eugene E. Ahern, First Lieutenant, M.C.

Dental Service: Virgil R. Ohlen, First Lieutenant, M.C.

Administrative Officers: Robert M. Barr, Major, M.C., Mess Officer; Albert Hayes, First Lieutenant, M.C., Registrar.

* * *

The importance to nation-wide research of the tuberculosis control demonstration, instituted in Meeker County in May, 1941, has been recognized by the gift of \$1,000 from the National Tuberculosis Association for use in continuing the project.

Announcement of the appropriation was received by Dr. E. A. Meyerding of Saint Paul, executive secretary of the Minnesota Public Health Association. The money is to defray the cost of x-rays and to provide a nurse for follow-up work.

The demonstration, launched by the tuberculosis committee of the Minnesota State Medical Association, of which Dr. J. A. Myers of Minneapolis is chairman, is complete cooperation, not only of Meeker County's

citizens, but of its physicians who are giving their service to it without charge.

Last month Miss Mary Dempsey, statistician of the National Tuberculosis Association, was in Litchfield to make a first-hand study of the project, which seeks to eliminate tuberculosis through giving tuberculin tests to every resident of the county.

* * *

A total of 434 Minnesota physicians had joined the medical service of the armed forces, as of June 15, according to the records of the Minnesota State Medical Association, and considerable more are expected to answer the call to arms. There are approximately 3,400 registered physicians in the state.

Among physicians who have entered the services of the Medical Corps, United States Army, within the last few weeks are:

Dr. A. B. Rosenfield, Hibbing school physician, who reported for duty June 12 in Omaha. He has the rank of major.

Dr. W. M. Haller of Bemidji, who has been commissioned a captain.

Dr. E. R. Addy of Gilbert, commissioned a first lieutenant.

Dr. Emil Johnson of Minneapolis, deputy coroner, who has been commissioned a first lieutenant. He reported for duty at Camp Carson near Colorado Springs, Colorado.

Dr. C. B. Abbott, Springfield, who has been commissioned a captain.

Dr. L. E. Sjostrom, Storden.

The University of Minnesota Board of Regents last month accepted the following gifts for medical research:

From the Rockefeller Foundation, \$15,900, to cover a three-year study of the mechanism of osmosis under Professor Maurice B. Visscher, head of the department of physiology.

From the Nutrition Foundation, Inc., \$5,000 in support of research on nutrition and resistance to fatigue in normal man to be conducted by Dr. Ancel Keys.

From the National Research Council, \$3,000, for continuation of study of congenital absence of teeth in human beings and its significance as a factor in heredity, under Dr. P. J. Brekhuis of the School of Dentistry and Dr. C. P. Oliver, director of the Dight Institute; also \$500 for study of the pituitary glands of children who have met with sudden and chiefly accidental deaths, under the direction of Dr. A. T. Rasmussen of the Department of Anatomy.

From the National Foundation for Infantile Paralysis, \$1,575, for further training courses in the Sister Kenny technique of poliomyelitis treatment.

The Citizens Aid Society of Minneapolis notified the board that it has voted to continue for three years its \$10,000 annual appropriation in support of the Cancer Institute Research Fund.

Hospital Notes

Miss Martha Stahler has accepted a position as superintendent of the Stevens County Hospital at Morris.

* * *

The Southwestern Minnesota Hospital in Heron Lake, according to Dr. Charles W. Rogers, has undergone an extensive modernization program.

* * *

Open house was held June 7 at the Glencoe Municipal Hospital, recently completed at a cost of approximately \$10,000. There were conducted tours.

Of yellow brick and tile, the building is completely fireproof. The outside wall of the operating room is made of glass blocks, and the room is equipped with explosion-proof devices.

Miss Clara Draxton is superintendent.

* * *

Completion of the new addition to the Swenson Memorial Hospital in Canby was observed May 31 with an open house.

Costing approximately \$52,000, the new fireproof addition and the remodeled hospital give Canby complete hospital facilities for emergency, surgical and medical treatment. It has a thirty-five-bed capacity. Mrs. Clara Draxton is superintendent.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

THE ESSENTIALS OF OCCUPATIONAL DISEASES. Jewett V. Reed, M.D., and A. K. Harcourt, M.D., Indianapolis. 212 pages. Price \$4.50. Springfield, Illinois: Charles C. Thomas, 1941.

As the name of this textbook implies, the subject is necessarily arranged for reference. It is essentially a compilation of notes by the authors. Half of the book is given over to tabulation and discussion of chemical poisons; the remainder to the discussion of lesions and diseases due to occupations. It is well written and should prove valuable to all physicians and especially those devoting their time exclusively to compensation work and industrial medicine.

The rapidly increasing importance of compensable disease and the all too prevalent threats of medico-legal controversy and impending socialization of medicine, makes a textbook of this kind a valuable reference to all physicians and surgeons in practice in the United States.

V. N. PETERSON, M.D.

IMMUNOLOGY. Noble Pierce Sherwood, Ph.D., M.D., F.A.C.P. Professor of Bacteriology, University of Kansas, and Pathologist to the Lawrence Memorial Hospital, Lawrence, Kansas. 2nd edit. 639 pages. Illus. Price, \$6.50. Cloth. St. Louis: C. V. Mosby Co., 1941.

This is the second edition of a very useful book on the expanding and intricate subject of Immunology.

While originally planned and used as a textbook for students it will be found to be a very thorough, although condensed discussion of the whole field of infection, resistance and diagnostic laboratory procedures. A judicious background of the principles of Pathology, Physiology, Biology and Chemistry involved is presented and the analysis of the underlying principles of Immunology is very thorough and understandable. Standard techniques are presented and the reasons for the various steps made manifest.

As a basis for exhaustive study in any allied field the book is very satisfactory and the exhaustive bibliography at the end of each chapter makes the necessary collateral reading readily obtainable.

C. H. SCHRODER, M.D.

COMMUNICABLE DISEASE NURSING. Ther. I. Lynch, R.B., Ed.D. Instructor in Education, New York University; formerly Superintendent of Nurses and Director of Instruction, the Willard Park Hospital, New York. 678 pages. Illus. Price \$2.00 cloth. St. Louis: C. V. Mosby Company, 1942.

This book is a presentation of Communicable Disease Nursing as it is taught in schools of nursing, the care of patients both in the hospital and in home. It is especially helpful in its presentation of history of communicable diseases and the part they have played in ancient and modern civilizations, taking one through the progress made in their control. Each disease is discussed and the present methods of diagnosis, treatment and control are presented as well as the details of the nursing care. There are pictures illustrating the gown technique and care of mattresses, linen, dishes, etc., in addition to color plates of manifestations of the disease. There is also a presentation of the methods used by public health nurses in their care of patients in their homes. It is particularly good in presenting the details of nursing care, procedures, and isolation techniques in the care and use of instruments and equipment. The book is very complete and should prove a valuable reference for any nurse working with communicable diseases.

FOR NERVOUS DISORDERS
Operated In Connection
with
Homewood Hospital
Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.

MEAD'S BREWERS YEAST

is proving of increasing value as a routine part of the patient's diet in treating such symptoms as nausea, vomiting, dyspnea, pains in legs and arms, muscle weakness and fatigue.

In one series, it was found that the physical, mental and emotional status of 120 pregnant and lactating women receiving Mead's Brewers Yeast and other foods rich in vitamin B was superior to that of a control group of 116 women.

Mead's Brewers Yeast contains the entire vitamin B complex, including thiamine, riboflavin and nicotinic acid. It may be given in tablet form and/or in powder form. The powder may be quickly shaken up with milk in an ordinary cocktail shaker. It also mixes well with tomato juice or ketchup.

Each Mead's Brewers Yeast Tablet contains not less than .06 mg. thiamine (vitamin B₁), .02 mg. riboflavin (vitamin G), and .15 mg. nicotinic acid, together with other factors of the vitamin B complex commonly occurring in nonviable brewers' yeast.

Evansville, Ind., U.S.A.

Timely Hints on Immunization . . .

Diphtheria Toxoids Lederle Smallpox Vaccine Lederle

COOPERATING WITH THE NATIONAL PLAN of having all children over six months of age immunized against diphtheria and smallpox, public health authorities of several states are undertaking intensive drives of their own to secure the protection of a maximum number of children from these infectious scourges of childhood.

Statistics† show that there was an increase of over 1,200 cases of diphtheria in the country in 1941 over the number reported for 1940. The median for the five preceding years was almost twice the number for 1940. Let us not lose valuable ground gained—the upward trend in the incidence of diphtheria must not continue in 1942!

The method of diphtheria immunization most generally favored at present is 2 doses of alum precipitated toxoid or 3 doses of plain toxoid. In addition, the Department of Health of New York City has adopted the plan of urging that a single supplemental dose of 1 cc. of plain toxoid be given shortly before entering school to all children who have previously been immunized during infancy.

Smallpox incidence in 1941 reached a new low,† and public health authorities and practitioners should be proud of this attainment! However, 1,368

cases of smallpox were reported in 1941. Since this is a preventable disease, it is obvious that the goal has not yet been reached.

†Pub. Health Rep. 57:23,24 (Jan. 2) 1942.

IMMUNIZATION SCHEDULE		
Immunization should be carried out against:	LEDERLE PRODUCT	TIME
Smallpox	Smallpox Vaccine*	6-12 months (revaccinate at 6 and 12 years)
Diphtheria	Diphtheria Toxoids*	6-12 months (Schick Test at 6 years—reimmunize if necessary)
Rabies	Rabies Vaccine*	Promptly after exposure
Immunization is recommended against:	LEDERLE PRODUCT	TIME
Scarlet Fever	Scarlet Fever Streptococcus Toxin*	After 18 months
Measles	Immune Globulin*	After exposure
Tetanus	Tetanus Toxoid*	Before probable exposure

PACKAGES

- "DIPHTHERIA TOXOID Lederle" (Plain)
1 and 10 immunizations
- "DIPHTHERIA TOXOID Lederle" (Refined Alum Precipitated)
1, 5 and 10 immunizations

You know it's Effective but have you heard about the Economy of **AMNIOTIN**

By packaging Amniotin in 10 cc. and 20 cc. vials we've provided a substantial saving over the cost of Amniotin in ampuls—and facilitated dosage adjustment to meet individual requirements.

These advantages have been made possible without sacrifice of activity, uniformity or stability. You can depend upon the effectiveness of Amniotin in relieving menopausal symptoms and in treating other estrogen defi-

ciency conditions...senile vaginitis... kraurosis vulvae...pruritis vulvae... and in gonorrheal vaginitis in children.

Amniotin—a highly purified, non-crystalline preparation of naturally occurring estrogenic substances derived from pregnant mares' urine—is available in ampuls for intramuscular injection; in pessaries for intravaginal use; in capsules for oral administration, as well as in the new economy vial packages.

Amniotin

A Squibb preparation of estrogenic substances obtained from the urine of pregnant mares

War Paint

In the midst of the blitz in England a lipstick became a symbol of democracy, bravely worn in defiance of that "wicked man's" attempt to shatter morale. Early in the history of the U. S. S. R. women protested against a ban on cosmetics, and it was lifted. These things are easy to understand when one reflects that cosmetics are an intimate part of a woman's life. They are essential to her well-being, her sense of personal fitness. When a woman knows she looks pretty she can face almost any situation with equanimity and courage. She needs her "war paint"; it bolsters her morale.

During the telling months ahead our industry may be deprived of certain raw materials. Packages and containers may have to be changed. Any great emergency is a test of resourcefulness. We believe that our industry will not be found lacking in that sterling American quality. Our research facilities are directed towards finding alternative raw materials that will be at least as satisfactory as those they replace. Come what may, we'll do our best to continue to supply American women with those aids to good grooming, those props to personality, that in their modest way contribute so much to national morale.

The "Catoptrum Microcasmicum" is one of the most beautiful and rarest of medical works. This volume by Johann Remmelin, published in 1619, contains fascinating anatomical drawings with superimposed sections. Only three or four copies of the book are known to exist.

Ever Since Eve woman probably has had to contend with the menopause. Only during a little more than a decade, with the availability of effective drugs—as epitomized by Theelin—has corrective medical treatment been possible.

Theelin replaces or supplements diminishing estrogenic ovarian secretion to "see the patient through" until endocrine readjustment occurs.

Hundreds of published papers pay tribute to Theelin, a pure crystalline estrogen, for meritorious service in such hypogonadal states as the climacteric, senile vaginitis, and kraurosis vulvae; and also gonorrheal vaginitis in children.

Theelin is doubly checked to assure uniform potency . . . by the laboratories of Parke, Davis & Company . . . and the Biochemical Laboratory of St. Louis University.

Theelin Suppositories for vaginal use and Kapseals[†] Theelol for oral administration are supplied for sustained therapy between injections and for patients who travel.

SICKNESS AS AN INSURABLE HAZARD

MAC F. CAHAL, J.D.

Executive Secretary, The American College of Radiology
Chicago, Illinois

BRUCE BARTON is author of the statement that the present era is one of organized minorities, each working against the other. Now, that may be a deplorable state of affairs, but from certain viewpoints at least it is more or less true; and if it is true, the meaning for medicine is clear. Medicine too must maintain a strong organization if it is to be properly represented in the kaleidoscopic changes our civilization is presently undergoing.

I am an exponent of the premise that the doctor should occupy a more active place in the civic life of the community that is usually the case today. Under the democratic process there is only one way he can effectively do this, and that is through a strong organization that will make his voice an articulate influence in the political, social and economic developments of the community. It is my personal opinion that a full time executive is essential to the successful accomplishment of the aims of any organization—medical or otherwise. Consequently, I think that the very first step for any medical society contemplating a program in medical economics as ambitious as the one you are contemplating should be to employ a full time executive with the proper qualifications to correlate the activities of the organization.

It is only natural that the tide of social processes resulting from the industrialization and urbanization of our population should reach the medical profession and exert some effect upon the individuals engaged in medical practice for a livelihood. This new development began to be felt by doctors only within the last fifteen or

twenty years, and only lately has medical organization come to mean anything more than a scientific body. Today the county medical society is beginning to perform functions for the local medical practitioners very similar to the functions which the chamber of commerce performs for the business and commercial life of the community. When I began my work with organized medicine ten years ago as the executive secretary of a county medical society there were only a half dozen such positions in the country. Today there must be near a hundred county and state societies which have realized that a full time executive is necessary if their organization is to be more than a monthly study club and if they are to occupy their rightful place of influence in the community.

I do not for a moment recommend that a medical society assume the character of a trade organization. I hope it will be possible for the medical profession to adjust itself to the increasingly exigent demands of society without divesting the doctor of his priestly robes. As a matter of fact, the real reason for organized effort by medical men is to retain medicine as an art and to maintain the doctor in his position close to the priesthood from whence he sprang.

The problems confronting medicine come from so many sources and manifest themselves in so many ways that it is sometimes difficult to decide just which is the best course to pursue. One of these problems is manifested in the recurring illustrations of the fact that there is a sustained attempt upon the part of professional uplifters and social zealots to institute a system of medical practice in this country that is alien to the traditional principles of Americanism. In the face of this increasing threat, organized medicine has in the

Address presented before the Ramsey County Medical Society, February 23, 1942.

last few years undertaken definite programs to meet the real or fancied need of a plan that would permit persons of low income to budget the costs of illness in a system of prepayment. Whether your local society shall embark upon a similar program is a question I presume you will be called upon to answer during the present year.

Whether or not there is an actual need for such a plan is a question open to debate. But one thing is clear: the socialization of medicine is no longer a question for academic discussion; all indications point to the fact that some kind of federalized program to remove the economic burden of illness from the individual will be enacted in the near future.

The enactment of the Social Security Act set the stage for the entry of compulsory health insurance advocates into the highest councils of our land. Since that time we have heard their arguments repeated again and again—in the President's Interdepartmental Committee on Economic Security, in the National Health Conference, in hearings on the Wagner National Health Bill, in the Capper-Epstein Bills, and in the prosecution of the American Medical Association under the Sherman Anti-Trust Law for having opposed the irregular expenditure of some \$40,000 by the Home Owners Loan Corporation to finance contract practice by a corporation in the District of Columbia. Almost daily during the past few months the press has carried dispatches from Washington indicating that the social welfare crowd in the government are going to demand an amendment to the Social Security Act providing compulsory health insurance, under the theory that an additional payroll tax will provide a check against inflation. We should not be unmindful that the cloak of "national defense" may be used to usher in a radical innovation during the present emergency that could not otherwise be accomplished.

In the face of these developments we may ask whether a system of sickness insurance is needed in this country to make available adequate health service. We may point out that evidence is completely lacking that any considerable portion of our people have ever been denied needed medical care. We may ask for evidence that sickness insurance has improved the health of the people in the twenty-five countries now having compulsory systems, or that it would do so in this country. When the advocates of compulsory sickness

insurance point to the high percentage of men rejected for physical defects under the Selective Service System as evidence that our people have inadequate medical care, we can counter with the fact that analysis of those figures reveals that not over 10 per cent of those rejected had physical defects which are subject to medical correction, and that the ignorance or indifference of the individual was usually responsible for their not having received treatment.

The fact is, of course, that what we are witnessing is an attempt to relieve the body politic of a gangrenous appendix by the injection of warmed sweet oil in the ear. If any problem exists, it is not because medical care is unavailable but because a portion of our people do not have sufficient money with which to pay for it. The social workers have put the cart before the horse. One of their most voluble fellow travelers has authored the statement that "the dominant motif in the establishment of every system of health insurance is the relief of poverty, not the preservation of public health" (I. M. Rubinow, *Annals*, Nov., 1933).

Payment for medical services usually takes between 4 and 5 per cent of the average family income. Of the amount so paid, the physician receives about one-third, or between 1 and 2 per cent. Manifestly, 4 per cent of an income of less than \$1,000 a year per family is not sufficient to pay for the medical services that may be needed in such emergencies as occasionally occur to nearly every such family. Neither can the percentages expended for food, clothing, shelter and education from such an income be sufficient during an average year to meet even modest health requirements. Such essentials can be provided only by adequate incomes or by some form of charity. Mere application of the insurance principle will not make available to the poor services which they cannot afford to purchase.

According to the most authoritative study of income ever made in the United States, about 13 per cent of the nonfarmer families in the prosperous year of 1929 had incomes of less than \$1,000 while the percentage of farm families below this sum was 55 per cent (Brookings Institution). Fifty-three per cent of the nonfarmers and 82 per cent of the farmers received less than \$2,000.

It would be idle to deny that about one-third of the population in this country cannot translate

into an effective demand their need and desire for such conditions of living as are essential to good health or pay the cost of the best medical service when they become sick. But it is likewise true that all those who need medical care do not desire it. There may be more than one road to the same goal, and it would seem that the logical road to better medical care is increased income and not insurance.

But the proponents of sickness insurance argue that the real economic problem of sickness is in the uneven burden it casts upon individual families by reason of its unpredictability. By spreading the costs over a large group, it is said, the burden can be equalized and those who do not need medical care will help to pay the costs of those who do. Every man in the community carries fire insurance on his house and when one man's house burns down his loss is made up by payments that have been made by a large group over a long period of time. But here we encounter a fundamental difficulty in putting the theory of insurance into practical application to relieve the economic burdens of sickness. Either a house burns down or it doesn't—but if I say I have a pain in my belly every doctor in the city of Saint Paul can't prove that I haven't.

A fundamental characteristic of an insurable hazard is that the frequency of the happening of the event, which is the subject of the insurance, should be subject to prediction within reasonable limits of error. A necessary corollary is that the happening of the event must not be subject to the control of the insured individual, or that there must be a strong incentive or normal desire on the part of the insured individual to avoid the happening of the event which is the subject of the insurance. It is equally necessary that the insured event shall be susceptible of precise and easily understood definition. The trouble with sickness insurance is that the happening of the event is almost solely subject to the control of the insured. And once medical service has been sought with respect to a condition, the volume of service becomes largely subject to the control of the physician. Because of these two facts there are some qualified experts in the field of insurance who insist that sickness is simply not an insurable risk. They say no insurance plan will work when the control of the expense is in the hands of someone other than the carrier who will pay the bill, and when there is no precise way of

determining when the event has or has not occurred.

Now, I have discussed some of the developments that have impelled the medical profession to consider embarking upon medical service plans in the hope that their control and management by organized medicine would obviate the evil effects of compulsion and political control in governmental plans. I have mentioned certain fundamental difficulties that are inherent in any type of prepayment for medical care. Whether or not organized medicine can find a solution to these difficulties is a question I am not prepared to answer. Neither am I prepared to say that voluntary plans under medical control will forestall the adoption of compulsory health insurance under the control of the government. The answer may be "yes" to both; but here are certain truths which should give us caution. In the first place, there is almost a complete lack of reliable experience upon which to base the actuarial features of a plan. In the second place, we should realize that voluntary sickness insurance plans abroad have not visibly delayed the adoption of compulsory plans but rather have been the forerunners of compulsory plans.

This being true, it does not follow that organized medicine is making a mistake in experimenting with voluntary plans. Even if the Social Security Act is amended in the next few years to provide for compulsory wage deductions on employes and compulsory taxes on employers to pay for a federal system of sickness insurance, these *voluntary* plans may very well set the pattern to be followed. All of the sickness insurance plans in European nations were built upon existing plans that had been operating for several years on a voluntary basis.

Assuming we have reached the conclusion that a nonprofit medical insurance plan, inaugurated, controlled, and managed by the local medical organization, is a wise and sound adventure, how should we begin? The first thing we will want to know, assuming enabling legislation has been enacted and the stage is set to begin, is how much it is going to cost. This is the first, and also the most difficult, question we must consider.

Several studies of the average expenditures for medical care have been made within the past ten years. The smallness of the data in the respective studies may have produced some unreliable results, but the consistency of these results is

significant. From such data as is available, it appears that the average per capita expenditure for physician's services is less than \$10 per year, the average increasing substantially with increase in income level, and to a lesser degree with increase in size of community. While the premium for any plan of comprehensive medical service would properly be in excess of the present average expenditure, it is probable that if the difference is too great, the plan would be very difficult to sell and the tendency towards adverse selection would be seriously increased.

But these figures are practically meaningless when we come to establish a premium for medical insurance, for the simple reason that people do not request and pay for all the medical service they would demand if it cost them nothing. To estimate the cost of care that may be actually demanded in a prepayment plan we must turn to studies of the actual need, and we must bear in mind that when the financial deterrent is removed more service may be demanded than is actually needed.

When we come to consider the probable demands for medical services under an insurance plan we enter a sea of conjecture, and the limited experiences already recorded by existing plans do not provide figures that would be accepted as conclusively reliable by those people who know most about this subject, actuarial experts in insurance.

Probably the most reliable study of the costs of adequate medical care was one made by Bradbury, based upon a standard table of sickness rates developed by Lee and Jones from a comprehensive review of available sickness statistics. His study revealed that, if every illness were properly treated, with no allowance for malingering, it would cost \$37.85 to provide adequate medical care for the average person per year, on the basis of present "Minimum" fees. Other studies have produced lower figures, but of the several made, none has indicated an annual cost below \$20.00 or \$25.00.

Thus, it is obvious that a conservative estimate of the cost of medical care under an insured plan will be greater than the amount that the average person is now paying for medical care. At the same time, it does not appear probable that the average person would be willing to pay an annual premium that would give the physician adequate remuneration for what is termed "ade-

quate" medical care, that is, proper care for every case of illness.

The true cost of medical care under a prepayment plan will probably fall somewhere between the amount people now pay for medical services and the figure deduced by Bradbury as the cost for "adequate" medical care based upon the incidence of illness. In my opinion, the soundest approach to the economic problems of sickness, and the one most socially desirable, would be the adoption of a plan that would insure the family of low income against the catastrophic illnesses; not the minor condition that requires a couple visits to the doctor's office and an expenditure of \$5 or \$10. What the wage earner really needs protection against is the insurmountable burden which confronts him when he incurs a charge for medical services that may be 10 or 20 per cent of his annual income. The social workers tell us we should provide for prophylaxis and prevention in any medical service system—but the problems of prevention and insurance are poles apart and no single plan will provide an answer to both.

The experience in some of the medical service plans established in the past few years proves rather conclusively that the type of insurance the wage earner really wants is one that will protect him when he is faced by a really large expense, and that he is only slightly interested in a plan that pays all his sickness bills, small and large alike. This has particularly been borne out in Michigan. There the state medical society has offered two types of coverage, one for complete medical care at a monthly premium of \$2.00 for an individual, and another for surgery and maternity service at a monthly premium of \$0.50. They have approximately 200,000 enrolled in the surgical plan, but only about 6,000 in the plan for complete medical care.

One of the plans in New York², the Medical Expense Fund, Inc., has a deductible feature which requires that the subscriber pay \$10.00 (or less according to his income) towards his bill before the benefits become applicable. This is intended to eliminate the small charges that increase the cost of insurance protection and at the same time provide protection for the serious illness. It is like the \$50.00 deductible collision insurance you carry on your car.

The inclusion of a deductible feature is logically sound and consistent with good insurance

practice; but it fails to answer one of the avowed purposes of sickness insurance, as advocated by the sociologists. They ask for a plan that will remove the financial deterrent and thus encourage a patient to consult his doctor early before an incipient disease has become acute.

The New York plan contains another ingenious feature; premiums are determined according to the subscriber's income—the traditional sliding scale is applied to insurance. The plan is not undergoing a rapid growth, even though the premium for the lowest income group is only \$9.00 per year.

The lack of demand for these complete medical care plans is rather eloquent proof of a fact I referred to earlier in this discussion. There is considerable room for doubt that the public really desires a plan that will permit prepaid budgeting of sickness expenses, notwithstanding the claims of the social welfare crowd. Wisconsin and the District of Columbia have both abandoned plans after it was demonstrated the enrollment would not be sufficiently large to justify continuation. After three years, the California plan has only about 30,000 subscribers out of a population of 7 million. Thus, it appears that these plans have to be sold if they are to fulfill their purpose and they are not likely to succeed if they are merely offered to the public without any of the accompanying techniques of salesmanship.

All these plans have certain basic characteristics in common:

1. They are confined to group subscribers; individual subscription adds to administrative expense and leads to adverse selection.
2. They are limited to subscribers within certain maximum income limits, usually 2 or 3 thousand dollars annually.
3. Premium rates vary from \$1.00 to \$3.00 per month, depending upon benefits included, with about a 75 per cent increase for couples and smaller increases for each child.
4. Benefits include all services, including laboratory procedures, roentgen diagnosis, and consultation, for the medical plans; the surgical plans are confined to "cutting operations" and maternity service, but include roentgen diagnosis and the examination of pathological tissues.
5. Payment to physicians is made on a fee basis or a unit basis. The difference is more appar-

ent than real, because in all, the physician is the real insurer. Earned premiums are regularly prorated according to the number of units or total fees turned in. The unit in California corresponds to the \$2.00 fee allowed for an office call in Michigan. The value of the unit in California has consistently amounted to about \$1.35. The guarantor of the service is not the corporation, but the physician.

Now, that is about all I know about medical service plans, and as Lady Godiva said when she reached the end of her ride, I am rapidly nearing my close. I should like to have time to tell you about another plan for the payment of sickness bills, but there isn't time. The plan I would describe is one providing for postpayment instead of prepayment. I have said that the public has not taken to these insurance plans as readily as some people thought they would—human nature is not such that the average man will pay in advance for a service he is likely to need in the future. But the installment habit is firmly fixed in the average family. It was my pleasure to inaugurate one of the first postpayment plans in the country some years ago, and that plan is still operating successfully. People who cannot pay full fees for service costing a large sum apply to a medical service bureau where a social worker analyzes their pecuniary status and establishes a fee which they can pay in installments over a period of a year.

In closing, I think I should say a word or two about hospital insurance. The adoption of medical insurance plans by state and county medical societies has been stimulated by the successful experience of group hospitalization plans which now have nearly 10 million subscribers throughout the country. These plans have proved of real value. They have helped the patient, they have helped the doctor, and they have helped the hospitals which had to find some new source of revenue when their income from endowments practically ceased during the period of the depression. But group hospitalization has raised some questions of serious implication for the medical profession. Just where does hospital service end and medical service begin? Notwithstanding the fact that the House of Delegates of the American Medical Association has reaffirmed the principle again and again that group hospitalization plans should not include within their benefits the services of physicians, several of the

large plans in existence, including your own, include the services of a radiologist, a clinical pathologist, and anesthesiology as a part of hospital care. Some of them have instituted ward service plans for the low income groups that include complete medical care.

Here we are witnessing a profound departure from the traditional functions of the hospital. There is an unmistakable tendency for hospitals to assume more and more responsibilities in the delivery of medical care and unless the profession is thoroughly alert we may find the hospitals occupying the role of a middleman as a distributing medium for medical care under prepayment plans that include not only hospital accommodations but the services of physicians as well.

Perhaps this is another reason why it is desirable for medical societies to institute medical service plans. After examining all the pros and cons it appears that the disadvantages of such plans are outweighed by the advantages. We cannot expect the system of medical practice in this country to remain in the status quo, when everything else is undergoing change and when it is obvious that the status is going to be less quo for a good many years to come. It would seem, therefore, that the wisest course for Medicine would be to take the lead in directing the course of change and setting the pattern for what is to follow in such a manner that the high quality of medical care in America will be preserved and its unequalled advancement will be continued.

THE ASSOCIATED MEDICAL SERVICE OF TORONTO

J. A. HANNAH, B.A., M.D.
Toronto, Ontario, Canada

I AM afraid Dr. Sohlberg has given rather too good a build-up for the man with whom he is dealing. I thought I had impressed Dr. Sohlberg with my comparative ignorance, and that I did not pose as an oracle on the subject of health insurance. The more one deals with this problem the more one realizes how little can be comprehended of it in a short time. I will, however, endeavor to answer as many questions as possible after I have introduced the subject, as I feel that this is the best way of telling you what you may desire to know, in so far as it is possible for me to do so in the light of our four and a half years' experience in Ontario.

I have been interested in the development of health insurance, as it is commonly called, for the past ten years. For the past seven years I have been making an intensive study of the problem, and during the past four and a half years have been learning, through actual experience, how different and impractical our theories are in relation to the actual application of the principle of insurance to the provision of medical care for the general public. I think it is fair to say that we are at present, in regard

to his problem, in the same position that life insurance was fifty years ago.

There is little doubt in my mind that we are going to get socialized medicine in North America, whether we like it or not. It has occurred to me that the best way of directing this inevitable system is to get in and lead it along the path which our experience shows us to be of the most benefit to the greatest number of people—the public as well as the profession.

I recently read an address by a man from a large industrial firm, giving a discourse on the question of postwar problems which would confront our system. He was, of course, dealing particularly with industry, in which he made a very strong plea for the continuation of the present individual and independent type of business. It is significant that the same man who made such a stand for the continuance of rugged individualism in business, made the statement that we must find some means of instituting socialized medicine. To me, it seems a bit incongruous that the group of men who have in the past shouldered, to the greatest extent, their responsibilities in regard to the lower income group of the population, should be held up for

socialization, whereas, ordinary business which has not looked after the low income group to the same extent as the medical profession, should be held up as the example for the continuation of rugged individualism.

Public opinion, however, is a peculiar entity and on many occasions these matters are not of our choosing, and in most countries, where health insurance has come into existence, it has come about as the result of demands on the part of the public.

This demand did not become apparent on this continent, until the recent so-called depression. So long as our standard of living was so much better than that in Europe, the individual has been able to carry, reasonably well, the costs in regard to medical care. The sparsity of our population may also have had something to do with the lack of spread of the idea. It is, however, becoming more and more apparent, in Canada at least, that we cannot withstand the tide of change and public demand, of which note is being taken by the governments of both your country and Canada.

Perhaps one of the greatest contributing factors to the development of this public demand has been the change in our general economic system, which has come about since the turn of the present century. I am comparatively a youngster, but I still remember when it was thought disgraceful to make a purchase on time, and if that purchase made on time were a luxury, it was considered almost criminal. That attitude has, however, all changed, particularly since 1918. Now it is considered the very best of business, both from the salesman's and consumer's point of view, to purchase anything desired, whether necessary or luxury, on the installment plan of \$5.00 down and \$5.00 if, and when, they catch you. It is, however, abundantly clear that the system does work. In the Province of Ontario, there is one pleasure car for every five people, and these are the very people to whom we have to supply medical care. It is a well-established fact that it costs a great deal more to purchase an automobile, let alone to operate it, than the amount spent on medical care. Why then do we hear so much about the high cost of medical care?

It appears to me that we, as a profession, have been so busy listening through our stethoscopes, or looking down our microscopes, that we

have not fully appreciated the economic groans of our patients. They do pay their bills, but at what a price! I am convinced that illness is more destructive to human planning than death. If a member of a family dies, then it is all over, and readjustments are made accordingly, but a protracted illness leaves an economic responsibility which makes it very difficult to proceed with family plans.

We, as a profession, have made tremendous strides in our scientific knowledge, particularly since the turn of this century. We have not, however, kept pace with the economic developments which have been going on around us. Hence we find that the profession of medicine, and its subsidiary adjuncts, are coming out on the short end of the economic stick.

Another reason contributing to the growth in public opinion towards socialization of medicine, has been the ever-advancing cost of medical treatment. At the turn of the century an x-ray film was more or less of an oddity, perhaps even a curiosity. Now, a physician without an x-ray film is the oddity. If to this one adds the additional costs of other advances, there has been quite a formidable increase in the costs of treatment.

Perhaps if we, as a profession, will stop looking down our noses at those in our ranks who become interested in the economic aspect of the practice of medicine in a fair and honest way, we may be able to do something to alleviate the distress of our patients. This can, however, only be done if we, as a profession, approach this problem fairly, honestly and without prejudice. If we will further forget the old shibboleth that our profession is one chosen especially by God and the public, to be set on a pedestal, and that the influence of economics cannot come near us, we may be able not only to advance our economic situation, but assist the public in securing the benefits of our knowledge. At the same time we may be able to place our own researches on a self-supporting basis. I, for one, have grown heartily ashamed of the medical profession going to industry and the wealth of the country with hat in hand, begging for funds with which to carry on research, which is so essential for the welfare of the health of our population.

How then are we to approach this problem, keeping in mind that we must at no time allow such circumstances to arise which will in any

way detract from the advances in treatment of our patients from whatever point of view one may approach the problem?

It would seem to me that we can learn something from those who dispense the goods which has raised the habit of smoking from luxurious indulgence to what we frequently hear termed a necessity at the present time. It is a fact that there is more money spent on smoking on the North American continent than there is on the cost of medical care. Why then do we not hear complaints about the high cost of smoking, as is the case in regard to medical services? It would appear to me that it is due to the fact that if a packet of cigarettes is smoked up, most smokers have twenty-five cents which to purchase another packet. If not, they can purchase a smaller lot for ten cents. Or, if perchance they may be broke, they borrow a cigarette from their friends and consumption still goes forward, and we find the financial statements of the tobacco combine consistently showing a good profit. In other words the individual can buy the where-withal to indulge himself in this luxurious habit in small quantities, so that he doesn't miss a quarter here or a dime there, but in the end, as we have seen, it amounts to more than the services which we, as a profession, have to render to these same people. I think there will be no question as to the relative value of the two products or commodities.

Let us consider for a few moments what happens if you or I or one of our patients has the misfortune to walk in front of an automobile which seems to have a more determined destination than the pedestrian. Such an unfortunate individual will have to have, and indeed will demand with no uncertainty, that an ambulance shall be available to take him to a well-equipped hospital, in which he will expect a bed to be available with a trained personnel to see to his every comfort. He will expect to be carted to the x-ray room and have pictures of all his bones and innards taken. If perchance any of them happen to be misplaced or jarred, he will expect a well-trained surgeon to be on the job within a moment's notice to operate on him in an expensively equipped operating room. He will also expect that so long as his life is in danger, or even during his convalescence, that he will be able to have his every need attended by highly trained technicians and professional individuals.

The part of this picture so readily forgotten by both the physician and the patient is the fact that the doctor, the nurse, and the technicians must live not only when an individual becomes injured or is ill, but during the period of time when such individuals maintain their health. Consequently, under our present system, while there is no installment buying of such services, the individual must pay not only for his present period of illness or accident, but he must put up his share of the cost of maintaining such equipment, trained personnel, and professional individuals, as we have cited above. Would it not be much more logical for both the profession and the public to realize that it would be ever so much easier if the individual could pay on a regular budgeted plan for the necessities of such services?

Such is the background and philosophy underlying our four and a half years' application of this principle through the organization known as "Associated Medical Services" with its head office in Toronto, Ontario, which has at the present time, some eight subsidiary branches throughout the southern part of the Province.

During the next few minutes I shall endeavour to give you some of the practical experience leading up to the organization and through the growth of Associated Medical Service, since its inception to the present time.

In 1930 I had the good fortune to be appointed Neuro-pathologist to the Department of Health in the Province of Ontario, and as such, I joined the Civil Service Association of Ontario. I almost immediately learned that that body had under consideration the establishment of a system whereby they might budget against the cost of illness. I learned, however, that they were committing the common mistake of taking what appeared to be the easiest and most obvious solution to their problem. They intended to go out and hire a group of physicians on a salary basis to give them their services.

I entered into their discussions and consideration of their plan. It was not difficult to point out to them the fallacy of their presuming that a limited number of physicians would prove satisfactory to all of their 2,000 members. I was able to convince them that choice of physician is one of the prime requisites for a successful organization, and after some three years in study with their committee, we were able to present at

their annual meeting in 1934 a plan which met with their approval.

This plan, however, presupposed the full co-operation of organized medicine, and I was detailed as a member of both the Toronto Academy of Medicine, and the Civil Service Association, to take the matter to the Academy.

The Academy, after some consideration, decided that the plan was good and that they would be prepared to lend their support, provided the plan could be extended to cover other groups in the city. The Academy further wanted to place the matter before the Ontario Medical Association in regard to the proposals. At the meeting, approval of the Council was given in 1936 to the establishment of voluntary plans, in trial areas through the Province.

On February 23 and 24, 1937, the final approval of Council and Board of Directors of the Ontario Medical Association was secured, and a loan of \$3,800 granted toward the establishment of the plan. In addition to this amount, the Ontario Civil Service Association made a loan of \$1,200, making a total of \$5,000 for organization purposes.

It is to be noted throughout that the medical profession gave us only their approval of the plan and financial assistance was given in the form of a loan. It was felt by the medical profession that they could not afford to risk either their finances or their reputation on a plan which might quite easily prove to be a failure.

Under date of April 9, 1937, a non-profit, non-share Charter was secured from the Provincial Secretary's Department, incorporating our services under the name of "Associated Medical Services, Incorporated."

We opened our offices on June 1, 1937, in space granted to us, rent free, by the Provincial Government at number 11 Queen's Park, Toronto.

I shall now have to turn back a bit to give you an understanding of the basis on which we arrived at what our subscription rate should be.

During the course of our initial study from 1931 to 1936, much ground was covered and a great deal of literature digested, and some of us spent a considerable portion of our holidays visiting plans in operation which might have any conceivable relationship to the one which we proposed to set up.

We felt that the only safe approach to the problem would be to reduce the services required to

an individual basis, and then set over against that, the fee which we proposed to pay for such services.

The first problem was to determine just what services would be required by a person during a year, in which they might have occasion to make use of the service. We reduced the services to the following items: home calls, office calls, consultations, surgery, hospitalization, special nursing, x-ray, laboratory and administration.

The next problem was to determine how much, on the average, of each of these items one individual in a large group might require during any service year. As a result of rather extensive study which has been listed elsewhere, we found somewhat as follows: There would be one home call per person per year required on the average, at a cost of \$3.00 per call. We could expect to have 1.5 office calls per person per year, at a cost of \$2.00 per call, making an additional \$3.00 for the individual. In regard to consultations, it was difficult to find anything of a very definite nature in regard to the number of these, or the cost of them, but on what information we had, we struck a rate of \$4.00 per person per year. Surgery was found to be required by eight persons out of every hundred, for operations of one kind or another. The average cost of such operations in Canada we reckoned to be in the neighborhood of \$50.00 per procedure. That is, we could expect to have to pay out for each individual in the service .08 times \$50.00, or \$4.00 per person.

We found that in regard to hospitalization, by and large, we could expect an average of 1.3 days per person per year, at a cost, as we reckoned then, of \$3.50 per day. This would make a total of \$4.55 in regard to hospitalization for each individual per year.

Our estimate of the cost of nursing was taken prior to the introduction of the three eight-hour periods per day of nursing, and it was felt that one-half day's service per person per year, at a rate of \$5.00 per day, would cover this feature, at a cost of \$2.50 per person per year.

X-ray and laboratory were reckoned at a cost of approximately \$1.00 per person per year.

Administration, it was felt, would incur another \$2.00 per person per year.

If all these costs now be totalled up, it will be found that they come to \$24.05 per person per

year. It will thus be seen that our figure was not a wild guess taken out of the air.

The figures which we have quoted are true in regard to the individual situation. They are not altogether true in regard to the family situation, or where the family unit basis comes in for consideration. In family groups up to four, there is a reducing ratio of service required in inverse proportion to the size of the family. After the average family of four has been reached, the situation reverses, and there is a mounting ratio of service required. The average size of a family in Ontario being 3.9, we were able to strike a reducing rate in the family situation, and so we set a monthly subscription rate of \$2.00 for the first member of the family, \$3.75 for two members of the family, \$5.25 for three members in the family, \$6.50 for four, and a dollar increase for each additional member in the family succeeding the fourth. On this basis, we collected our first subscription as indicated above, on June 1, 1937, and in return for that subscription, promised our subscribers the services as listed previously, namely, home calls, office calls, consultations, surgery, hospitalization, special nursing, x-ray, laboratory and administrative costs.

From the first of June to the 31st of December, 1937, we added a total of 733 subscribers. At the end of December, 1938, we had 4,020 subscribers. At the end of 1939, approximately 10,000, December 31, 1940, 20,000, and at the end of 1941 approximately 30,000, so that at the time of speaking, we have had four and a half years' experience, with a growth as indicated above.

Out of our income, we have paid all of our administrative expenses, salaries, and medical costs. We have been able to repay the loans granted to us by both the Ontario Medical and the Civil Service Association, and have accumulated a reserve of approximately \$98,000 against future and unrepresented claims. In addition to the above, we have assets in the form of equipment totalling approximately \$25,000.

The amount of checks and controls will undoubtedly be a question which you will raise at the end of this period, and I shall therefore not attempt at this time to delineate the numerous problems, and our solutions to them, but shall endeavour to answer such questions as may be of interest to you, as they are raised.

A short discussion in regard to administrative procedures may now be in order. One of the greatest difficulties in any such plan as we have endeavoured to provide, has been the mounting administrative costs, and in many cases the administrative costs have exceeded the cost of providing medical services. After four and a half years' experience, I can well understand how such might become the case, unless the administrators are very diligent, and prepared to make changes when duplication and unnecessary procedures become apparent.

The amount of detailed work necessary in any such plan requires that the methods of mass production be applied, in so far as possible, and that automatic machines be utilized to the full. In fact, the administration of such a plan is indeed the happy and useful hunting ground of all types of office machine equipment, and if used judiciously, can become one of the organization's greatest assets.

Our administrative costs at the outset were obviously high, and to some extent the same is true at the present time. However, three years ago our administrative costs were approximately 24.6 per cent of our total income. Two years ago it was down to 21 per cent, and in 1941, had dropped to 19.5 per cent. Up to the present, during the year 1942, this administrative expense dropped to the neighborhood of 17 per cent. It is to be remembered that in this cost is included cost of acquisition of new subscribers, and the cost of administering the collection of monthly subscriptions, and the payment of monthly accounts to the physicians, both of which procedures are extremely expensive to administer.

The cost of collecting our subscriptions on a monthly basis has, however, been less than 1 per cent. At the beginning of any one month at the present time, we have in the neighborhood of 18,000 subscriptions due us. On the 15th of the month there are less than 300 subscribers still outstanding, and by the end of the month, we seldom have to cancel more than thirty subscribers for nonpayment of their subscription. This fact may be due to our Regulation which states that while any subscription is outstanding the corporation shall not be responsible for any expense incurred during such period. Under these circumstances, the subscriber makes sure that his subscription is in our office on the 1st day of the month in advance.

Much of the success of any such plan will depend upon its careful and considered administration. Although Associated Medical Services is operated on a non-profit basis, and on humanitarian lines, there is no presumption that its dollar will stretch any farther than anyone else's in ordinary business. Therefore, we take particular pains to see that no more than the service which we promised is rendered for the subscription paid. Administration must be just and fair, as well as consistent in each situation which may arise.

Through all this discussion you have undoubtedly been asking yourself the question, "How does the profession like it?" Well, it reminds me a bit of the old childish rhyme, "Pease porridge hot, pease porridge cold . . . some like it hot, some like it cold," and some don't like it at all. I think, however, it is fair to say that out of the 1,800 physicians who are actually participating with us throughout the province, 80 per cent are satisfied. That is, as satisfied as you can get any group of physicians when a radical change of principle is involved. Probably 15 per cent are indifferent. There is a 5 per cent balance who just don't like us at all, and I may say that we in our turn, do not like some of them any better.

A few of those who do not like us are, as a group, high class type of men who feel, and justly so, that they can only limit their practice by charging a heavy fee. In this group are included some of my very best friends. There is, however, another group who are not so high class, and are of not such a good calibre, who expect to receive \$5.00 for every office call, and who seem to feel that nothing short of ten calls for any condition is worthy of their consideration. For these people, we have our own top ceilings and deal with them by indicating that we can get along better by going our own individual ways.

The whole organization is voluntary, and if by chance an applicant names a physician who is not participating, we immediately return his subscription and refuse to accept his application.

In regard to the subscribers, it is undoubtedly true that those with incomes of upwards of \$3,500 do create a considerable amount of difficulty, as compared with those below that bracket. There are, however, a certain number even in the lower income group that feel that because

they have paid their subscription that they should have attendance very frequently, and in quantities far beyond their individual capacity to pay. It is not uncommon however, for a physician to call us up and indicate, or to put a note on his account, that such and such an individual is demanding a lot of his time and service. To a certain extent these individuals may be weeded out before they become subscribers, since the family physician has an opportunity of indicating to us the type of individual, when we write to him asking for his past history. In any case, it is not long until we see from the history card whether or not they are being reasonable with the plan. If we feel that unreasonable demands are being made, we can cancel forthwith, or we can give three months' notice of cancellation, and this is not an uncommon means of handling such a situation. Starting with 20,000 subscribers at the beginning of 1941, and ending with approximately 30,000, we had 92 cancellations, for abuse of medical privileges.

Another question which may be in your mind is, "How long do your people stay with you?" In January of 1942, we made a survey of the first thousand members handed out. This represented some 1,622 subscribers. Out of this number who first became subscribers, we still had with us 78 per cent, who were obviously satisfied, or they would not be with us after four to four and a half years.

Another legitimate question may arise in your minds regarding how frequently we have to make changes in our Regulations. When we started our organization, we admitted frankly that it was on an experimental basis, and both our doctors and subscribers understood this to be true.

Just here I would throw out a word of warning to the profession. It is not to be expected that any plan can be pulled out of a hat and set to work to the satisfaction of all concerned. We might as well realize now as at any time, that however this change is brought about, there is going to be a long period of readjustment on the part of both the profession and the services before it works to the satisfaction of all concerned. Personally, I am of the opinion that nothing short of ten to fifteen years will develop any plan to the place where it is reasonably satisfactory. Nor need we expect at the end of that time that all is going to be honey and clover. The only state of complete stasis of which I know, is to be

found in rigor mortis. It is my opinion that the moment any such plan as our own becomes static, that moment will it have died.

The question is not whether or not we are going to have a period of readjustment and difficulty, but rather, the question seems to be, "How are we going to make that adjustment?" Is it to be under stress and strain; under suspicion on the part of all, or are we going to approach the problem frankly and openly, giving full coöperation to the public and government; recognizing that they too have their rights in the problem, and that we must make adjustments as well as they? If we approach this problem in this manner, there appears to be no reason why this advance cannot be made a happy experience, the same as any advance we make in regard to our professional knowledge.

Now then, Mr. Chairman, I have taken a good deal more time than I had intended when we started. It has indeed been a great pleasure to me to come to your meeting and discuss with you a problem in which I am vitally interested. If by any chance I have thrown out any suggestions which may be helpful to you as a profession, I am more than happy. I shall be very pleased to answer, to the best of my ability, any questions which may be put forward from the floor of the meeting. Once again, my sincerest thanks for paying me the compliment of having me here at your meeting.

Question 1.—Your administration cost was figured at 8 or 9 per cent. I was wondering whether there is other distributions in your original estimate which make up the amount you discussed later (19 per cent) and whether you see a possibility of increasing or decreasing the cost?

Answer.—I should have told you during my discussion that there is a two-month waiting period, during which we are not responsible for any medical services, but during which the subscriber pays the same rate of subscription. This fee is charged to cover the cost of securing application and setting up files. Last year, for instance, we had roughly, ten thousand new subscribers who each paid us, roughly, about \$1.85 for each of two months, or a total of \$37,000, which is in no way related to the subscription rate charged. This will account for the additional administrative expense over and above that set out in my original discussion.

In answer to the question, "How are specialists taken care of in the plan?", I would say that the basis of our service is that of a general practitioner, and if a subscriber wishes to make use of a specialist, for instance, through a pregnancy, we feel that they must bear the additional cost of that specialist. The usual

fee allowed in Ontario by us for the delivery of a child to a general practitioner is \$45.00, including complications. If one of our subscribers chooses to use an obstetrician throughout a pregnancy, she must pay the difference between the \$45.00 and the obstetrician's usual charge.

If a surgeon chooses to charge an extra fee, over and above that allowed by the O.M.A. tariff, he must indicate so to his patient, before he begins the operation so that the individual has an opportunity of deciding whether or not he wishes to pay the additional amount to the surgeon. Generally speaking, there is not any great difficulty in regard to specialists, as the vast majority of them make no extra charge over and above the ordinary O.M.A. tariff of fees.

Question 2.—Do you take in groups, and how do you get subscribers? How do the medical profession keep control?

Answer.—The only group which we have so far recognized, is that of the family group in which application must be made on an individual basis. We will not take part of a family unless the whole family makes application.

We have secured our subscribers mainly through our satisfied customers. Our newspapers have given us a considerable boost from time to time, and, on occasion, welfare organizations, home and school clubs etc., have given us a considerable amount of assistance. On other occasions we have been asked by certain programs dealing with social welfare problems to broadcast over the radio. These are the main ways in which we secure our subscribers.

"How does the profession retain control?" In our Charter it is specifically stated that there must always be a majority of medical men on the Boards throughout the province. In all, there is a majority of at least ten medical men in membership in the Corporation. Our Charter laid down the specific ratio of laymen there must be in relation to medical men who can vote, and the majority is always medical. In this way, the final control rests in the hands of the medical profession.

Question 3.—Is there any limit on the financial status of participants, and how are special fees determined?

Answer.—There is no limit to financial status except that we have learned through experience that persons in the higher income bracket do create some difficulty, and they, therefore, now find it more difficult to get in than other individuals. The physician himself is asked if he knows of any reason why such an applicant should not be accepted as a subscriber. He thus has the right of choosing whether or not an individual shall become a subscriber.

Question 4.—Does an individual name a family physician?

Answer.—He must name a family physician when sending in his application, and he must secure all his

services through that nominated physician, unless special permission is granted to do otherwise, or in cases of emergency.

Question 5.—How are specialist fees set?

Answer.—If a specialist is not satisfied with the O.M.A. tariff of fees, he has the right to indicate before he starts on an operative procedure, to the subscriber that he will charge an extra fee. If the subscriber chooses to pay such extra fee, it is a matter of personal arrangement between the physician and his patient. In the vast majority of surgical cases there is no demand for a fee above the average, and we have not found difficulty in this regard. In regard to obstetrics, if the subscriber chooses to use such a specialist throughout a pregnancy, she can pay the difference just the same as if she chooses to pay the difference and have a private room in a hospital.

Question 6.—In case a policyholder has no physician, or the physician is not participating, has the individual the right to name such a physician?

Answer.—We will not accept such an application naming a physician who does not choose to participate.

Question 7.—Suppose the physician will not abide by the ruling of your board, would you permit him to participate?

Answer.—No. A.M.S. is a voluntary organization, and he has the right to participate or not, as he chooses. If he does not wish to participate and abide by the rulings and decisions of the Corporation, then we cannot accept him as a participating physician, and anyone naming him as a family physician would be told that we could not accept his application.

Question 8.—What per cent of the medical men are in your organization?

Answer.—It varies from center to center. Generally speaking, over 92 per cent of the physicians in those areas where we operate are participating. In the city of Toronto, out of 1,200 physicians practising, we have over 1,100 participating. I am not suggesting that they are all out cheering and waving their hats for us, but they are satisfied in at least 80 per cent of cases.

Question 9.—I heard you refer, Dr. Hannah, to your plan as a coöperative setup. Is this true in the literal sense of the meaning of coöperative?

Answer.—This is not true in the ordinary sense of the coöperative, such as "Farmers' Co-operative" if that is what you mean by "coöperative." It is controlled under a charter, set up under the Companies Act of the Province of Ontario, and is run by a Board of Directors, elected each year at the Annual Meeting.

Question 10.—The point I want to make is, is there anything about your coöperative that would make it impossible for the board to change your methods? Can't

they amend your Constitution at your Annual Meeting?

Answer.—"The Constitution may be amended at the Annual Meeting, but unless the profession is lax in attending such annual meeting, it is not possible for the control to pass out of the hands of the profession. If it is impossible for the medical men to attend, I have, in the past, asked them to give me their proxies. Of course, if the medical men become careless, and do not attend the Annual Meeting, it will be possible for the laymen to bring a group and change the Constitution, and upset the whole show. Our organization is not set up as a true coöperative, in the ordinary sense of the word."

Question 11.—Can a family name a physician who is participating, and then if they wish to change after becoming subscribers, choose a non-participating physician?

Answer.—They may change their physician, if they give us notice in writing. However, they can only change from one participating physician to another participating physician. If they choose a nonparticipating physician, we have to decline to accept their nomination, and cancel their subscription, if they wish to stay with that nonparticipating doctor.

Question 12.—If the cost of medicine and fees were to exceed the cost of office calls, do you make any provision?

Answer.—The only provision we make is an average of fifty cents per day while in hospital for drugs. If the doctor wishes to charge for drugs, at the time of the call, he can do so. We do not, however, pay for any drugs in addition to the office call.

Question 13.—What is the method used in handling a physician who deliberately has the patients come in too often in order to build up his practice?

Answer.—If a doctor shows too much discrepancy from the average cost, he is first asked to come in line, and if he fails to do so, it is indicated to him that we no longer wish to have him as a participating physician. Our statistics keep accurate count of the cost, both to the nominated physician and to specialists required by such a physician. A great deviation from the norm in such a situation calls for serious consideration, even dropping him as a participating physician, and it is on this basis that we handle all such matters.

Question 14.—Can a subscriber name more than one physician when he applies?

Answer.—No. Only one physician can be named for each subscriber, but each member of a family may name a different physician.

Question 15.—When a subscriber puts a doctor's name on his application, does he have to go to that particular physician? What does he do if he wants to

see an eye doctor? Does the physician suggest an eye doctor?

Answer.—That is right, the nominated doctor and the patient choose the specialist.

Question 16.—*How do you handle libel? Are you subject to damage suits?*

Answer.—We are not responsible for the actions of a doctor, or other person, or institution, which may cause damages to the patient. If, however, a person is not satisfied with our decision, he has recourse to the ordinary courts. In our four and a half years, we have not yet had a suit, but we have one pending at the present moment.

Question 17.—*Suppose a doctor is out of town and can't get back, and a nonparticipating doctor is called in, what do you do then?*

Answer.—Of course, in a case of emergency, we don't ask about it, we go ahead and pay the account, but require our subscriber to return to his own doctor at the earliest possible moment.

Question 18.—*Do you find that you reach the low income group with this plan?*

Answer.—We are not reaching the very low income group, although we have 28 per cent of our subscribers with incomes of less than \$1,000 per year. It will only be possible to really reach the low income group when the medical profession fully appreciate their responsibility in regard to this matter, and are prepared to make reductions in their fees, in accordance with the situation covered. That is, they can well afford to take a good deal lower fees, if they are going to be paid for the very low income group, than if the plan only covers those of the higher brackets. Such low income groups will require assistance, perhaps both

from the government and their employers, as well as the coöperation of the profession, before the problem can be really solved. However, I am of the opinion that if the profession goes to work in earnest with such a plan as we have provided, it will be possible for them to reach this low income group.

I am at the present time in the process of tearing our organization limb from limb, and making an analysis. In this analysis I find, for instance, that our subscribers stay in hospital fourteen days for appendectomy. When they are paying the cost themselves, they stay in just a little better than ten days. In obstetrics they stay about fourteen days under our plan, whereas when paying for it themselves, they stay less than eleven days. These and many other factors must be taken into consideration in arriving at our final conclusions.

I do, however, feel that if the profession goes to work in earnest on this proposition, it will be possible to bring the cost down to such a level that employers and employes will find it to their advantage to join such an organization."

Question 19.—*How do you handle night calls?*

Answer.—We allow an additional dollar for calls made at night. The question of mileage is not our responsibility. We do not pay for transportation of the patient to the doctor, or the doctor to the patient.

Question 20.—*In case your organization becomes bankrupt, what would you do, would there be any return of premiums to your subscribers?*

Answer.—If we go insolvent, we are on the same basis as any other company. Our assets would be liquidated, and our debts paid in accordance with the amount of money available, after such liquidation. There would be no return of premiums to any subscriber. Our service is on a month-to-month basis only.

YOU ARE LUCKY TODAY

The last century was a period of unbelievable progress. But in no field was greater progress made than in care of the sick, and in advancing the standards of public health.

A century ago, for instance, anesthesia for surgical operation was unknown—it did not come into use until 1846. And even later, in Civil War days, hospital death rates of 20 per cent and more were not uncommon. Nothing was known of infectious diseases, the germ theory had not been heard of, and sterilization of instruments and dressings was never practiced. Not until 1868 was a start made in curbing and controlling infection.

Startling is the fact that 99 out of 100 American hospitals were founded within living memory. Fifty years ago hospitals were generally confined to large cities—in small towns and rural areas, operations took place at home, by the light of kerosene lamps and an open vessel steaming on a stove as sterilizer. The medical men were not content. It was due to their initiative that hospitals in smaller centers were gradually established.

The whole history of medicine is a history of individual effort—of tireless private initiative—of unselfish men fighting the endless war against disease and public ignorance. And all of us lead happier, fuller lives because of it.

A STUDY OF OSTEOPOROSIS BY MEANS OF CONTROLLED X-RAYS OF THE BONES

Part II.

R. S. YLVISAKER, M.D., and E. L. GARDNER, M.D.

Minneapolis, Minnesota

IN PREVIOUS articles,^{1, 2} one of us (E. L. G.) has called attention to a group of patients with gastrointestinal complaints who had a definite osteoporosis of the bones (hand and wrist) when compared with normal subjects, and has outlined in detail the technique employed in determining the presence and severity of osteoporosis.

The present study concerns itself with a statistical analysis of two hundred and seven consecutive cases which were x-rayed in the manner previously referred to. In this analysis the X^2 method is used, X^2 being a measure of the total discrepancy between the observed frequencies and those calculated on the assumption that there is no association between the two variables. Therefore, the larger X^2 is, the greater the evidence of correlation. P is the probability that a value as large as the given X^2 would arise through sampling errors alone. When P is less than .05 (5 per cent) this is considered adequate evidence of the existence of real correlation between the two variables. The nature of the correlation (whether positive or negative) can be determined by inspection of the table.

For statistical purposes a slight change has been made in grading the osteoporosis from that described in the paper detailing the technique used in this work. Instead of dividing the series into those showing no osteoporosis, Grade I, Grade II, Grade III and Grade IV osteoporosis, we shall here simply refer to those showing no osteoporosis, slight osteoporosis, and definite osteoporosis. Slight osteoporosis corresponds to Grade I, while definite osteoporosis includes Grades II and III. There are no cases with Grade IV osteoporosis in this series.

Originally, the cases were divided according to the sex of the patient, there being fifty-eight males and one hundred and forty-nine females. Although the females showed a greater tendency toward increasing osteoporosis with advancing age than the males, the difference was found not to be significant statistically. It was therefore decided to study the group as a whole without

TABLE I
INCIDENCE OF OSTEOPOROSIS IN RELATION TO AGE

AGE	OSTEOPOROSIS			TOTAL
	NONE	SLIGHT	DEFINITE	
10-49	O 48	35	39	122

reference to sex except in the case of those factors which concerned one sex only.

In examining the tables, it will be noted that both the figures showing the observed incidence of osteoporosis and those showing the calculated incidence are included, the observed values being in heavy print opposite the letter O, and the calculated values in lighter print opposite the letter C. Values for X^2 and P are shown for each factor studied except in the case of occupation where the number of cases in one group is not large enough for this.

Table I shows the incidence of osteoporosis in the group as a whole, as well as a gross division according to age. There are sixty-six cases showing no osteoporosis, sixty-four slight osteoporosis, and seventy-seven definite osteoporosis. Of the normal group, only eighteen are over fifty years of age, showing a definitely decreasing presence of normal bones with age. This is borne out by the values for X^2 and P. However, the fairly large number of cases of definite osteoporosis (39) in the lower age group indicates that age is not the only factor. The group is not large enough to make a finer division into decades.

Table II shows the incidence of osteoporosis in relation to occupation. The types of occupations encountered in this group are similar to those

seen in any private office practice in a large urban community. It is essentially a "white collar" group. The miscellaneous column in this table can be considered the "white collar" workers. It was thought best to keep the housewives in a separate column. This group shows an increased incidence of osteoporosis. However, the small number of manual laborers makes statistical analysis impossible on the basis of occupation. Clinically, we have definitely gained the impression that there is a relatively decreased incidence of osteoporosis among manual laborers; that it is largely a disorder of the so-called "white collar" workers. This is borne out by our experience at the Minneapolis General Hospital, where perhaps the majority of patients are manual laborers of one type or another. Here it has been difficult to find cases for teaching purposes similar to our group showing osteoporosis.

Table III is a composite table in which are included those factors studied which show no relationship to osteoporosis, namely, civil state, gastric acidity, and, surprisingly, pregnancies. Sixty-two of our patients were single; one hundred and forty married; data in this respect being incomplete in five cases. The low X^2 , and P well above 5 per cent, shows a definite lack of correlation between civil state and osteoporosis. Gastric analyses were done in sixty-three cases. Here again a rather gross division is made, the group being divided between those showing absent to low free hydrochloric acid values and those with normal to high acid. Twenty degrees of acid is used as the dividing line. Many of those cases with low acid values showed acid only after histamine stimulation. No correlation with osteoporosis is seen. In regard to pregnancies, the women in the group are rather evenly divided between those having had no pregnancies (seventy-nine cases) and those having had one or more pregnancies (seventy cases). No correlation between a history of one or more pregnancies and osteoporosis is found. If the pregnancy group were further subdivided according to the number of pregnancies in each case, a correlation appears in those with four or more pregnancies, but the number is not large enough for proper statistical evaluation.

Table IV is again a composite table in which are included those factors studied which show a definite relationship to osteoporosis. In regard to the condition of the teeth, a simple division is made between those with obviously good teeth and

healthy gums with only minor dental repairs, and those with excessive dental repair, several to many teeth missing, partial or complete plates and obviously unhealthy gums. A very definite correlation is found between the condition of the teeth, so defined, and osteoporosis.

The criterion used to determine the adequacy or inadequacy of calcium intake was the history of whether or not the patient had over a long period of time consumed at least two to three glasses of milk and/or a considerable quantity of cheese daily. On this basis, a very definite correlation is seen between calcium intake and osteoporosis.

In studying the relationship between bowel function and osteoporosis, we have divided our cases into those with a history of normal bowel function with no symptoms or signs pointing to disturbed bowel function, and those with evidence of intestinal hypermotility. In the intestinal hypermotility group are included those with a history of chronic diarrhea, spastic constipation and cathartic habit. This is the so-called irritable bowel group. We believe there is adequate evidence to show that an intestinal hypermotility, especially of the small bowel, exists in these cases. Only one case of true constipation, that is, actual delay in the progress of the meal through the intestinal tract, was found in this series. This patient was later shown to have a partial obstruction due to bands of adhesions and is not included in this table. It is seen that a very marked correlation exists between bowel disturbances, as defined, and osteoporosis, P being less than 0.1 per cent.

Table V shows the effect of bowel function

INCIDENCE OF OSTEOPOROSIS
IN RELATION TO CALCIUM INTAKE AND BOWEL FUNCTION

superimposed on that of calcium intake. In other words, the adequate and inadequate calcium intake groups are further broken down into those with normal bowel function and those with intestinal hypermotility. It is readily seen that intestinal hypermotility definitely increases the incidence of osteoporosis in the adequate calcium intake group, whereas normal bowel function decreases the incidence of osteoporosis in the inadequate calcium intake group. The best group (least osteoporosis) is that with adequate calcium intake and normal bowel function; the worst group (most osteoporosis) that with inadequate calcium intake and intestinal hypermotility. This arrangement of our data results in the highest value for X^2 encountered in this study; an extremely strong probability that bowel function when

TABLE VI

INCIDENCE OF OSTEOPOROSIS IN RELATION TO SYMPTOMS

SYMPTOMS	OSTEOPOROSIS			TOTAL
	NONE	SLIGHT	DEFINITE

Palpitation	9 7.3	6 7.1	8 8.6	23 $\chi^2 = .68$ $P = .6+$

superimposed on calcium intake further affects the incidence of osteoporosis, P again being less than 0.1 per cent. The effect of calcium intake and intestinal hypermotility and their combination on the incidence of osteoporosis is illustrated graphically in Charts 1 and 2, in which the incidence of osteoporosis is given in percentages rather than in number of cases.

Table VI lists the symptoms most frequently encountered in this series of cases. No correlation is found to exist between any of these symptoms and the incidence of osteoporosis except in the case of constipation where a borderline positive correlation ($P=5$ per cent) is found and in the case of abdominal pain where a definitely negative correlation is found. The correlation between constipation and osteoporosis supports the previous finding of correlation between bowel function and osteoporosis, all but one case of constipation being of the spastic type. It is difficult to explain the negative correlation be-

tween abdominal pain and osteoporosis except for the fact that this series includes many cases of organic abdominal disease such as peptic ulcer and gall-bladder disease; and no attempt is made here to distinguish between types and locations of pain. A much larger series of cases would be required in order to sub-classify the various types of abdominal pain and discomfort.

Conclusions

In conclusion, it can be stated, therefore, that this study shows a definite, positive correlation between osteoporosis and age, condition of the teeth, calcium intake (as defined) and intestinal hypermotility (as defined). No correlation is found between osteoporosis and sex, civil state, gastric acidity and pregnancy. It might well be that a larger series of cases would bring out a correlation with one or more of these later factors. When the adequate and inadequate calcium intake groups are further subdivided according to bowel function, a further correlation with osteoporosis is found. Insufficient number of cases in the manual labor group makes statistical evaluation on the basis of occupation impossible. We believe, also, that we can conclude from this study that we have in this method a valuable measure of the calcium reserves of the body.

We are indebted to Dr. A. E. Treloar of the Division of Biostatistics, University of Minnesota, for guidance in the analysis of the data in this study.

TUBERCULOSIS IN THE ARMY

Medical tests of Canadian army recruits are being sharpened to the point where today only about one out of 1,000 men develop tuberculosis after being accepted in the army. Since May, 1941, a total of 895 men have been discharged from the army because of pulmonary tuberculosis, but of that number 251 had served for several months before being x-rayed. —MAJOR G. T. ZUMSTEIN, Royal Canadian Army Med. Corps, *Bulletin Canadian Tuber. Assn.*, March, 1942.

TERATOMATOUS CHORIONEPITHELIOMA OF THE OVARY

Critical Review of Literature, With Report of a New Case

RODNEY F. STURLEY, M.D.

Department of Obstetrics and Gynecology

University of Minnesota Medical School

Minneapolis, Minnesota

THE presence of chorionepithelioma in testicular teratomata was described by Schlagenhauer in 1902. He suggested that the chorionepithelioma was derived from the outer epithelial layer of fetal membranes. In the same year Kleinhans reported chorionepithelioma of the ovary which he believed to have followed an ovarian pregnancy. In 1904 Pick described the first case of ovarian teratoma containing chorionepithelioma. In using the term "teratoma" the terminology described by Robert Meyer will be followed.

The diagnosis of chorionepithelioma, whether it occurs after pregnancy or in a teratoma, is based on definite histological findings. Seitz lists the following findings that must be present:

1. Tumor is composed of both syncytium and Langhans cells.
2. Tumor cells are arranged in masses or cords with Langhans cells inside and the syncytium around the periphery.
3. Tumor has no connective tissue stroma of its own.
4. There is no vascular supply within the tumor.
5. The tumor cells grow toward, surround and penetrate maternal blood vessels.
6. There is coagulation of tissue, hemorrhage and necrosis.

Since the description of chorionepithelioma of the ovary without evidence of tumor in the uterus or tube by Kleinhans in 1902, forty-one other cases have appeared in the literature. Not all cases are alike, for it is apparent that there are two fundamental sources of chorionepithelioma of the ovary: (1) a pregnancy in the uterus, tube or ovary, (2) a teratoma.

There are three possibilities for the origin of the tumor following pregnancy:

1. Transportation of chorionepithelioma to the ovary from the uterus or tube followed by complete regression of the primary tumor.
2. Transportation of normal chorionepitheli-

um to the ovary from the placental site of an intra-uterine or tubal pregnancy; the chorionepithelium then undergoes malignant degeneration at the new site.

3. Ovarian pregnancy.

That these three possibilities exist is easily understood, but to prove a single specific origin in the individual case is difficult. It is important, where site of origin is not clear, to study thoroughly the generative organs for evidence of primary tumor as Risel (1914) has done. In his case, a twenty-five year old woman who had had three previous pregnancies, the last eight months prior to operation, was found to have a hemorrhagic tumor of the right ovary which was histologically diagnosed chorionepithelioma. He found a small brown scar in the fundus of the uterus composed of a mass of clear granulation cells containing lipoid, blood pigment and showing destruction of elastic fibers in the uterine muscle and vessels. He considered the area as a remnant of a primary tumor which had followed the previous pregnancy and had undergone regression.

Chorionepithelioma of the ovary occurring in the mature, nonvirginal woman is best considered of placental origin in the absence of teratomatous findings. Although the patient's last pregnancy may have been many years before, it is always possible that a new and unsuspected pregnancy may have intervened. Some authorities believe the tumor tissue may have a long latent period before the appearance of clinical symptoms, thus explaining the apparent non-relationship to a past pregnancy. The origin of tumors occurring in the virgin is indefinite unless other tissues characteristic of teratoma are found, such as glia, cartilage, or muscle.

Pure chorionepithelioma of the ovary without evidence of primary tumor elsewhere may represent an overgrowth of chorionepithelioma with the destruction of the other teratomatous tissue, or it may represent primarily an exclusive development of special teratomatous cells. In the

case described by Bettinger (1932), a seven year old child was operated upon for the removal of an ovarian tumor composed of masses of Langhans cells and syncytium, with large areas of hemorrhage and necrosis. Thorough examination of the tumor failed to reveal other teratomatous constituents. It represented a teratoma since the remote possibility of pregnancy may be ignored. Similar cases in children have been reported by Read (1928) and Tscherne and Schaffer (1939).

In the adult, chorionepithelioma of the ovary can only be proven teratomatous if other tissues characteristic of teratoma are found. Even then it is theoretically possible for teratoma and pregnancy to be combined. When pure chorionepithelioma of the ovary occurs in the adult, one should carefully search uterus and tube for evidence of primary tumor or placental site and only then consider the remote possibility of the very infrequent teratoma. Only twelve proven teratomatous chorionepitheliomata of the ovary are known. Eight occurred in children before puberty and three of these failed to reveal other teratomatous elements.

The presence of chorionic villi in a chorionepithelioma of the ovary is good evidence that the tumor did not arise in a teratoma. Chorionepithelioma of the ovary containing villi has been reported by Dougal (1924) and Sunde (1922); both cases were considered of placental origin. Theoretically, villi could occur in the teratoma if embryonal mesenchyme were present and could form an adequate stroma for the villi and, secondly, if blood vessels were present, within which the villi might advance. However, in spite of advanced embryological structures, as umbilical cord, occurring in teratomata, normal placental tissue has never been reported. Pick (1904) described a case which he believed represented a dermoid cyst with hydatidiform mole. A thirty year old woman had a dermoid cyst and a tube in which pregnancy had occurred removed from the same side. The isthmus portion of the tube was enlarged to the size of a walnut and contained placental tissue. The dermoid cyst had a separate cystic area toward the tubal pole; the cyst had a smooth lining and contained serous fluid and a papillary structure composed of grape-like vesicles, partly necrotic and partly swollen and presenting marked regressive changes. He believed the structure represented

a hydatidiform mole which may have arisen from the tubal pregnancy or from the teratoma. That it originated from the teratoma is unlikely since the structure was in a cyst separate from the main mass. From the description it was more likely a cystoma papillomatosum in degeneration.

Chorionepithelioma of the ovary in childhood is manifested by precocious sexual development and uterine bleeding. In the adult the usual complaint is irregular vaginal bleeding, suggesting a diagnosis of ectopic pregnancy. There is usually some abdominal distress and often a palpable mass. The Aschheim-Zondek and Friedman tests are positive. In the child, the positive pregnancy test is sufficient to make a diagnosis of teratomatous chorionepithelioma. Fasold (1931) reported a case of a child eight years old, who presented precocious sexual development. The Aschheim-Zondek test was positive. A tumor mass occupied the right adnexal region. A portion of a small nodule in the neck was removed for biopsy and revealed tissue similar to chorionepithelioma. No further operation was performed nor was an autopsy subsequently done. A diagnosis of chorionepithelioma of teratomatous origin seems unquestionable because of the patient's age and the positive pregnancy reaction.

Several types of ovarian tumor, in the course of their growth, may undergo changes in morphology as a result of varying conditions within the tumor and simulate chorionepithelioma by the development of nonspecific syncytium. This phenomenon has evoked speculation over a third possible origin of chorionepithelioma of the ovary. However, similar changes of carcinoma cells into syncytial masses when they are in contact with blood are known to occur in organs other than the ovary. It is, therefore, confusing to classify ovarian tumors having these structures with chorionepithelioma originating in a teratoma or after a pregnancy as Miller has done in the Henke-Lubarsch handbook of pathology. The phenomenon has no relationship to chorionepithelioma and is only mentioned to avoid diagnostic error. It is valuable, in this respect, to describe cases in which the diagnosis or the appearance of the tumor is deceptive.

Ovarian tumors containing cells resembling Langhans cells and syncytium have been reported by Michel (1905), Niosi (1905), Schmaus

(1906), Fergue and Massabauu (1913), Bock (1924), Klaften (1934) and others. Michel described a case of a sixteen-year-old virgin who was operated upon for an ovarian tumor which was diagnosed alveolar carcinoma. Two and a half years later the girl died of recurrence. At autopsy, the entire abdomen was filled with tumor of pithy consistency and rich vascular supply. The tumor varied in color from gray to dark black. The gray areas presented the alveolar carcinoma structure while the darker areas and the metastases contained massive areas of hemorrhage and fibrin meshwork. Around the margins of the hemorrhagic areas were masses of clear, sharply circumscribed cells resembling Langhans cells, as well as darker colored masses of syncytium containing many nuclei. There were no other findings to suggest teratoma. Michel interpreted these findings as secondary and stated that one should be cautious in the diagnosis of chorionepithelioma of the ovary because carcinoma cells in contact with blood may form very similar syncytium.

A case described by Bock (1924) differed from Michel's case in that the original tumor presented a picture resembling chorionepithelioma. A thirteen year old virgin was found at laparotomy to have an inoperable tumor of the right ovary. The tumor was nodular and varied in color from white to dark red. Microscopical examination of the larger nodules revealed large, solid masses of carcinoma. In the hemorrhagic and necrotic areas between masses of carcinoma were nests of small, differentiated cells resembling Langhans cells surrounded by masses of protoplasm containing many nuclei. There were no other forms of tissue in the specimen to suggest teratoma. Again, the chorionepithelioma-like picture occurred in an ovarian carcinoma only where the cells were in contact with blood.

Schmaus (1908) described a similar ovarian tumor occurring in a child of fifteen years. At laparotomy a large left ovarian cyst was removed. Inside the cyst was a solid white nodule with a few hemorrhagic areas scattered through the tissue. The tumor was an adenocarcinoma. In the hemorrhagic areas and in the metastases, masses of clear cells covered by syncytium were found.

Klaften (1934) described in an eleven year old child a tumor which presented a problem of differential diagnosis. The major portion of

the tumor was composed of round darkly staining cells similar to granulosa cells. Other areas presented masses of smaller cells surrounded by syncytium. The diagnosis could have been (1) granulosa cell tumor with rich plasmodium formation similar to that in chorionepithelioma, (2) teratoma, or (3) a collision of teratoma and granulosa cell tumor. A diagnosis of teratoma was made after careful examination disclosed adenomatous structures similar to pseudomucinous cystoma and intestinal epithelium. Because of the connective tissue formation and new blood vessels in the tumor, the areas suggesting chorionepithelioma were considered only plasmodium formation.

Since the origin of chorionepithelioma of the ovary is of great interest, an attempt has been made to sort out all cases reported in the literature and assign to them the most likely origin, where this has not already been done. As mentioned, Risel considered his case a primary uterine chorionepithelioma which, after metastasizing to the ovary, underwent spontaneous regression. Kleinhaus (1902) attributed his to an ovarian pregnancy. Tumors reported by Iwase (1908), Ries (1914), Voigt (1925), Simard (1931) and Peters (1940) all occurred in women in the late childbearing age with histories of previous pregnancies. Fairbairn (1909), Klotz (1913), Kedrierski (1913), Frank (1916), Seitz

(1916), Phillips (1920), Sunde (1922), Dougal (1924), Zalka (1926) and Preston (1937) have reported the finding of chorionepithelioma in the ovary without evidence of a primary tumor in the uterus or tube. These tumors occurred in women between twenty-one and thirty-one years of age who had histories of recent pregnancies or periods of amenorrhea followed by vaginal bleeding. In this group, Klotz found structures similar to villi in blood vessels. Dougal and Sunde found definite villi in their tumors.

Simard (1937) described a case occurring in a virgin seventeen years of age. Maki and Takeda (1931), Glinski and Rosner (1905) and Varo (1929) have also reported similar cases in virgins from seventeen to twenty-seven years of age. In these cases no definite teratomatous tissue was mentioned. That they may have arisen in teratomata can be neither denied nor proven. Kynoch (1919) reported a case of chorionepithelioma occurring in a twenty-four year old nullipara. The patient complained of irregular vaginal bleeding prior to operation which suggests pregnancy but the case is not decisive. The presence of chorionepithelioma in the ovary is mentioned by Rohdenburg (1926) and Chisholm (1920) but the information is not sufficient to draw conclusions. F. Miller (1914) reports a case in which the primary tumor was grossly diagnosed sarcoma and in a recurrence chorionepithelioma was found. Since the original tumor was not examined histologically, it is impossible to determine the exact type it represented, but its occurrence in a virgin of seventeen suggests that it may have been of teratomatous origin. Bollag (1916) described a tumor of the ovary occurring in a nineteen year old virgin in which the predominant tumor element was chorionepithelioma while other areas demonstrated sarcoma. This tumor may have been a teratoma, but the description is not clear. Lubarsch (1904) (quoted by Pick) diagnosed chorionepithelioma from a biopsy taken from a pelvic tumor involving the entire pelvis of a thirteen year old child. Because of the extent of the tumor, it was impossible to determine the original site, and no autopsy was done. On the basis of age alone, it might be assumed that the tumor was an ovarian teratoma.

Since Pick's description of the first teratomatous chorionepithelioma of the ovary, eleven other conclusive cases have been reported in the

literature. To this group we add one new case.

Case 1.—Pick (1904). Child nine years of age admitted to the hospital because of abdominal enlargement. At laparotomy a teratoma of the ovary was removed. The tumor was composed of the usual teratomatous structures in addition to chorionepithelioma identical histologically with that found in tumors of the uterus after pregnancy. The patient died several weeks later.

Case 2.—Albrecht (1913). Virgin eighteen years of age from whom a tumor of the right ovary the size of a child's head was removed. The tumor was mostly necrotic and contained numerous hemorrhagic areas. The tissue showed the usual histological picture of chorionepithelioma. The patient died of metastases.

Case 3.—Read (1928). Child eleven years of age admitted to the hospital because of slight vaginal bleeding. She developed pain in the abdomen. At laparotomy a right ovarian tumor on a pedicle was found. Several twists in the pedicle accounted for the pain. The tumor was coarsely lobulated and had an intact capsule. On section the tumor was firm and elastic and contained several cystic spaces filled with clear fluid and blood. On histologic examination only typical chorionepithelioma was found. The uterus and tubes were normal. Patient died of metastases one month after operation.

Case 4.—Freund (1929). Child seven years of age admitted to hospital because of pain in the abdomen. At laparotomy a tumor was found arising from the right ovary. On section, the tumor was composed of white-gray and dark red hemorrhagic areas. On microscopic examination, the dark red areas were typical chorionepithelioma, the white-gray areas contained cartilage, bowel, smooth muscle, nervous tissue and squamous epithelium. The patient died.

Case 5.—Fasold (1931). Child eight years of age admitted to the hospital because of vaginal bleeding associated with precocious sexual development. The Aschheim-Zondek test was positive. A tumor was felt in the region of the right ovary. Biopsy of a nodule in the neck revealed chorionepithelioma. No operation or autopsy was done, but in view of the positive pregnancy test and the age of the patient, the diagnosis is clear. Patient died.

Case 6.—Bettinger (1932). Child seven years of age admitted to the hospital because of pain in the pelvis associated with general malaise and weight loss. There was precocious development of the breasts. At laparotomy a tumor the size of a fist was removed from the right adnexal region. Histological examination revealed large masses of necrosis and hemorrhage and in better preserved areas, chorionepithelioma. No other teratomatous tissue found. Because of the patient's age the diagnosis is clear. The patient died.

Case 7.—Siegmund (1932). Child six years of age admitted to the hospital with a history of precocious

development of the breasts, external and internal genitalia, and the appearance of vaginal bleeding. Aschheim-Zondek test was positive. A tumor was removed from the left adnexal region which, on section, varied in appearance; some areas were solid, others cystic. The tumor was gray-red in color with scattered black areas. Glial tissue, squamous epithelium and cysts lined by cylindrical epithelium were found on histological examination. Areas composed of masses of Langhans cells covered by syncytium were described. At autopsy the diagnosis was definitely established. All the metastases contained pure chorionepithelioma.

Case 8.—Fikentscher (1937). Child fourteen years of age admitted to the hospital complaining of vaginal bleeding. A tumor the size of a man's fist was removed along with a nodule in the omentum. On section the tumor showed extensive hemorrhagic infarction. There were two parts of the tumor, one composed of typical structures of teratoma and another of typical chorionepithelioma. The nodule in the omentum was also chorionepithelioma. The Aschheim-Zondek test was positive after surgery. Patient ultimately expired with metastases. Chorionepithelioma was present in all metastases.

Case 9.—Tscherne and Schaffer (1939). Child eight years of age admitted to the hospital with a history of vaginal bleeding for five months, increase in the size of the breasts, and growth of hair about the genitalia. The Aschheim-Zondek test was positive. A large tumor involving the uterus was removed. Section of the tumor showed it to be brown-red in color and very friable. Microscopically the tumor was typical chorionepithelioma. There were no teratomatous areas mentioned. Patient died with metastases.

Case 10.—Sbarcea (1939). Woman twenty-seven years of age admitted to the hospital with a history of vaginal bleeding for ten months. The Aschheim-Zondek test was positive. At laparotomy a left ovarian tumor the size of a man's head was removed. The rest of the generative tract was normal. The tumor was composed of cartilage, smooth muscle, glia, pseudomucinous cysts and squamous epithelium. Typical chorionepithelioma was found in the hemorrhagic and necrotic areas. Eight days after operation the Aschheim-Zondek test was positive. Patient died and at autopsy all metastases were chorionepithelioma.

Case 11.—Oda, Matsushita, Kurosu (1940). Child eleven and one-half years of age admitted to the hospital complaining of mass in abdomen. There were no other symptoms. A right ovarian tumor the size of a fist was removed. The tumor was nodular, with gray and bloody areas. The tumor was composed of chorionepithelioma and other teratomatous elements including cartilage, cysts and tubules lined by columnar epithelium, squamous epithelium and muscle. Two subsequent operations were performed. Each specimen showed chorionepithelioma. Child expired after the third operation.

Case 12.—Backus, G. R., and E. P. Griffin, Jr. (1941). Child thirteen years of age was admitted to the hospital complaining of right lower quadrant pain. At laparotomy a right ovarian tumor the size of an orange was removed. The tumor had a firm, intact capsule. Grossly the tissue was hemorrhagic; microscopically, it was composed of typical Langhans and syncytial cells. No other teratomatous elements reported. The tubes and uterus were normal. Twelve days after operation the Friedman test was positive. The child died six months later. At autopsy numerous metastases composed of chorionepithelioma were found. The uterus and tubes were free of tumor. Because of the patient's age, the absence of the menarche, the intact hymen and the positive Friedman test, a diagnosis of teratomatous chorionepithelioma is acceptable.

Author's New Case of Teratomatous Chorionepithelioma of the Ovary

Mrs. L. M., aged nineteen, no pregnancies. Menstrual periods began at the age of fifteen and were regular until one year prior to operation, when periodicity was lost and duration of bleeding prolonged. The patient bled from March 14 to March 21, 1940, from March 31 to April 9, from May 2 to May 9, from May 17 to May 22 and from June 17, 1940, to the time of curettage on July 6, 1940. At the time of curettage a definite mass was felt in the left adnexal region. A diagnosis of ectopic pregnancy was made.

Laparotomy was performed on July 8, 1940, for removal of a mass measuring eight centimeters in diameter from the region of the left ovary. The tube was not involved. The postoperative course was uneventful. Sixteen days after the operation the patient developed pain in the left lower quadrant and shortly thereafter a mass was noted. Vaginal bleeding recurred. A second operation was carried out on August 29, 1940, at which time a hemorrhagic mass ten centimeters in diameter was removed from the left broad ligament. The tumor had extended to the body of the uterus and the latter also was removed. The right ovary and tube were left in situ. Six weeks after the second operation the Friedman test was positive. The patient was given deep x-ray therapy to the abdomen postoperatively and to the chest after metastases were demonstrated. The patient expired eight months after operation with cerebral metastases. Autopsy permission was not granted.

Surgical specimens were examined through the courtesy of Dr. Louis Roberts.

Description of the Specimens

1. *First Operative Specimen.*—Macroscopically: A round ovarian tumor eight centimeters in diameter, with a thin smooth walled capsule which was gray in the thicker areas and dark colored in the thinner, more transparent areas. There were small pebble-like elevations on the surface. On gross section the tumor was dark red to black with a very narrow peripheral zone of gray best seen near the hilum of the ovary. A few strands or septa from the capsule extended a short distance into the tumor substance. Several small

smooth-walled cysts filled with thin serous fluid were present in the gray areas.

Microscopically: The primary tumor contained ovarian stroma with areas of well preserved cortex, in which there were numerous normal primordial fol-

licles. The surface epithelium dipped into the cortex and formed deep clefts. A developing follicle in the same area demonstrated granulosa cell layer five or six cells thick and a theca layer four or five cells thick. The theca cells stained more clearly and had larger nuclei. A second follicle in regression had a granulosa layer two cells thick, the nuclei of which were arranged in antipodal manner, with the outer row of nuclei toward the theca and the inner row of nuclei toward the lumen. The theca cells were proliferating. There was also an atretic follicle in which the granulosa appeared as an interrupted cord or darkly stained cells lying in the center of a fibrous and hyaline membrane which in turn was covered by a zone of proliferating theca cells.

Fig. 1.

Fig. 2.

licles. The surface epithelium dipped into the cortex and formed deep clefts. A developing follicle in the same area demonstrated granulosa cell layer five or six cells thick and a theca layer four or five cells thick. The theca cells stained more clearly and had larger nuclei. A second follicle in regression had a granulosa layer two cells thick, the nuclei of which were arranged in antipodal manner, with the outer row of nuclei toward the theca and the inner row of nuclei toward the lumen. The theca cells were proliferating. There was also an atretic follicle in which the granulosa appeared as an interrupted cord or darkly stained cells lying in the center of a fibrous and hyaline membrane which in turn was covered by a zone of proliferating theca cells.

Masses and cords of lutein cells were scattered through the cortex. Some clusters of these cells were better preserved than others. These were luteinized theca cells, large, round and rich in cytoplasm with large, round nuclei. Some cells showed vacuolization of the cytoplasm and pyknosis of the nuclei. One large mass of cells had a cavity and immediately about the cavity were smaller, less luteinized theca cells.

Near the surface, and in one instance elevating the surface were small, sharply circumscribed nodules of decidua-like cells. The cells were large, clear cells

cells showed degeneration, irregular cell outline, pyknosis or absence of the nuclei. A few cells were scattered along the surface of the ovary.

Glial tissue was present in immediate contact with the ovarian stroma. In better preserved areas there were typical forms of neuroglia, the astrocyte with long smooth unbranched fibers and irregular cell outline, and the smaller cells with less distinct cellular processes, the oligodendroglia (Fig. 1). Within the glial tissue were several small cysts lined by squamous epithelium. In one the cyst wall had been partly destroyed and filled with necrotic tissue from the chorionepithelioma. It contained three small bodies made up of concentric rings of hyaline material. A layer of squamous epithelium could be recognized about one of the bodies. These appeared to be cholesteatomata (Fig. 2). A second cyst lined by squamous epithelium was surrounded by a wide zone of tissue very rich in collagen fibrils. Farther from the cyst the tissue assumed the normal appearance of glial tissue.

One cyst, recognized grossly, was lined by a single layer of tall columnar epithelium similar to that in pseudo-mucinous cystoma. The cells varied from tall columnar to very low cuboidal. At one point the epithelium dipped into the connective tissue to form a gland. In the immediate vicinity were other tubular

or glandular structures lined by similar columnar epithelium. Parts of the cyst epithelium and glands were necrotic. In another area of the teratoma were adenomatous masses of the same tissue. The cells were arranged in a tubular manner separated by fine con-

nucleated. There was a heavy infiltration of lymphocytes in this area.

2. *Second Operative Specimen.*—Macroscopically: Recurrent tumor and uterus. The recurrent mass

Fig. 3.

Fig. 3a.

nective tissue septa (Figs. 3, 3a). In the necrotic areas of this tissue were large masses of lymphocytes.

Sections of the hemorrhagic tumor tissue revealed masses and cords of polygonal, almost round cells varying widely in size. The cytoplasm was clear, the nuclei round. Larger cells had more distinct cell outlines. Where these cells were in contact with blood and plasma, syncytial cells had developed. In the same areas transitional stages could also be seen (Fig. 4). The syncytium appeared as a thin line or strip of tissue containing numerous dark staining irregularly shaped nuclei and was situated along the surface of masses of Langhans cells where they were in contact with blood (Fig. 5). Some areas showed masses of cytoplasm containing many darkly stained nuclei of various shapes. Regression and necrosis of the chorionepithelioma could be seen where the tissue was unable to obtain sufficient nourishment to survive. In one area, the chorionepithelioma was invading glial tissue. At the junction of the two, the invaded tissue and chorionepithelioma had reacted by coagulation.

The chorionic cells also invaded the adenomatous structures previously described (Figs. 3, 3a). Here only large isolated cells with irregularly shaped darkly stained nuclei were seen, some of which were multi-

occupied the region of the left tube and broad ligament. The tumor tissue had extended to and involved the left lateral wall of the uterine corpus and had covered almost half of the upper surface of the fundus. The tumor invaded the uterine wall in nodular manner but did not involve the cavity. The uterine cavity was smooth and presented no abnormal findings. The cervical os was patent. The left tube was adherent to the mass on the posterior surface. The tubal lumen could be identified and was patent, without evidence of tumor involvement. The right tube and ovary were missing. The tumor mass was irregular in outline and measured 9x6.5x4 centimeters. The basal part of the tumor was irregularly ragged and friable with dark red to black color. The upper part of the tumor was smooth and covered by a thin connective tissue capsule. A strand of omentum was adherent to the posterior and lateral surfaces of the mass. Within the omental tissue was a nodule of hemorrhagic and necrotic tissue grossly similar to the main tumor tissue.

Microscopically: Sections taken from the recurrent mass revealed typical masses and strands of Langhans and syncytial cells. Sections of the uterus where the tumor was adherent showed invasion and replacement of the outer layers of the musculature by the chorion-

epithelioma. The inner layers of the myometrium and the endometrium were not involved. Although the tube was surrounded by tumor tissue, its musculature and mucosa were not invaded. There were no other teratomatous constituents found in the recur-

of the ovary to which has been added one new case of teratoma with chorionepithelioma of the ovary occurring in a nineteen-year-old woman who had never been pregnant.

Fig. 4.

Fig. 5.

rent tumor. The diagnosis was, then, primary chorionepithelioma arising in a teratoma of the ovary.

Summary

Chorionepithelioma of the ovary without evidence of primary tumor elsewhere may arise following a pregnancy or as a part of a teratoma.

The diagnosis of teratomatous chorionepithelioma demands the finding of other teratomatous constituents in the mature individual. This is most often not necessary in the prepubertal child.

Sytoplasmatic changes of carcinoma tumor cells in contact with blood must not be called chorionepithelioma since this term implies origin of the tumor from ectoblastic cells. The term pseudo-chorionepithelioma is acceptable.

A review of the literature dealing with chorionepithelioma of the ovary revealed twelve definite cases of teratomatous chorionepithelioma

INTERAURICULAR SEPTAL DEFECT

WILLIAM S. TINNEY, M.D.

and

ARLIE R. BARNES, M.D.

Rochester, Minnesota

SLIGHT patency of the foramen ovale or an opening of sufficient size to permit passage of a probe is the commonest of all congenital cardiac defects, the incidence, according to Patten, being approximately 25 per cent. This defect is merely a slight variation from the normal development and is of no clinical importance except in some cases of terminal myocardial failure with increased pressure in the right auricle, a condition under which it may give rise to paradoxical embolism or to terminal cyanosis. Defects 1 cm. in diameter or larger in the interauricular septum are real congenital malformations rarely diagnosed clinically and found infrequently at postmortem examination. Four cases have been reported previously from the Mayo Clinic, Amberg and Willis having reported the first one in 1926. In 1936 Erickson and Willis

presented another case, and in 1937 Ingham^{9,10} discussed in detail two additional cases.

In 1934 Roesler made a complete review of the literature on this subject and reported one case of his own. In 1940 one of us (Tinney) reviewed the literature since Roesler's article and reported two new cases, making the total number of cases reported eighty-six. Practically all of the clinical and pathologic features typical of interauricular septal defect were well illustrated by the four cases which are reported herewith; the first two cases demonstrated several interesting complications.

Report of Cases

Case 1.—A man fifty years old was admitted to the Mayo Clinic, September 14, 1941, complaining of edema and a rapidly beating heart. In 1925 he had experienced his first attack of tachycardia, which started abruptly, lasted fifteen minutes and stopped suddenly. During the next six years he had had five similar attacks. In 1931 he experienced the first

Submitted for publication May 18, 1942.

Dr. W. S. Tinney is a Fellow in Medicine in the Mayo Foundation and Dr. A. R. Barnes is in the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

Fig. 1. Interauricular septal defect; marked dilatation of the right auricle and ventricle.

Fig. 2. Dilatation of the right ventricle and pulmonary valve.

spell of tachycardia that lasted five hours. At that time roentgen-ray examination revealed cardiac enlargement. Since then the patient had had a similar attack every one to twelve weeks, lasting from thirty minutes to fifteen hours. With each one of these attacks he became severely dyspneic, and the tachycardia always left him with a feeling of epigastric fullness. He took digitalis periodically from 1931 to 1936, when it was discontinued because he was said to have an "incomplete heart block" as a result of the drug. Since 1932 he had taken at least 6 grains (0.4 gm.) of quinidine daily and since June, 1941, he had taken from 20 to 30 grains (1.3 to 2 gm.) daily. In May, 1941, the attacks had become more frequent and prolonged. During the two months prior to admission, auricular fibrillation had been present constantly, dyspnea had been severe, and the patient had noticed gradually increasing edema of the ankles and puffiness under the eyes.

Examination at the clinic revealed marked edema of the extremities, moderate dyspnea, and râles at the bases of both lungs. The left border of the heart was 2 cm. to the left of the midclavicular line. The cardiac sounds were of poor quality and of variable intensity. There was a sharp first sound at the apex, with obliteration of the second sound. The pulse was rapid, unequal, and irregular. The blood pressure measured in millimeters of mercury was 108 systolic and 82 diastolic. The abdomen was distended with moderate ascites, and the liver was palpable to four fingerbreadths below the costal margin.

The electrocardiogram disclosed a rate of 131, auricular fibrillation, and impaired ventricular conduction. A roentgen-ray examination of the thorax revealed marked widening of the right and left borders of the heart and pulmonary congestion.

The clinical diagnosis was chronic mitral endocarditis with stenosis and regurgitation, paroxysmal auricular fibrillation and congestive heart failure.

The patient was treated with salyrgan, digitalis, and quinidine and appeared to be doing very well when he died suddenly, September 23, 1941.

At postmortem examination the peritoneal cavity contained 150 c.c. of clear yellow fluid. The hepatic margin extended 9.5 cm. below the xiphoid cartilage and 2.5 cm. below the right costal margin. Each pleural cavity contained 500 c.c. of clear yellow fluid. The transverse pericardium measured 22.5 cm., and the pericardial sac contained 300 c.c. of clear, dark yellow fluid. The heart weighed 735 gm. (Figs. 1 and 2). There were two "soldiers' spots" at the left side of the base posteriorly, each measuring 3 mm. in diameter. The right auricle and ventricle were markedly dilated and hypertrophied. The left auricle and ventricle also were dilated, but there was no hypertrophy. The interauricular septum was absent, the opening measuring 5.5 cm. in diameter. Near the base of this septal defect there was a small band separating the opening into two apertures, the larger one measuring 5 cm. in diameter and the smaller one 1.5 cm. in diameter. There was dilatation, grade 3, of the rings of the pulmonic valve, tricuspid valve, and pulmonary artery. The pulmonic valve also was thickened. The mitral valve was thickened, the edges were curled under, and the chordae tendineae were thickened and shortened. In the left auricle there were numerous subepicardial hemorrhagic spots 2 cm. in diameter. There was slight sclerosis of the coronary arteries. The diameters of the cardiac valves were as follows: aortic valve, 7.3 cm.; mitral valve, 9.3 cm.; tricuspid valve, 15 cm. and pulmonic valve 11.5 cm. The depth of the left ventricle was 10.2 cm., the thickness of the wall of the ventricle 1.3 cm.; the depth of the right ventricle was 16.5 cm. and the thickness of the ventricular wall 0.6 cm.

Comment.—This case is interesting because the congenital lesion was complicated by mitral

stenosis, regurgitation, and auricular fibrillation. Interauricular septal defect is the only congenital cardiac lesion frequently associated with mitral endocarditis or auricular fibrillation. Because of the presence of mitral stenosis this case is an example of the so-called Lutembacher's disease.

Case 2.—A man aged thirty-six years was admitted to the clinic September 10, 1938, because of abdominal symptoms which proved to be unrelated to the cardiovascular system. He did not give a history of rheumatic fever, but stated that since the age of two years he had been known to have a heart murmur. For one month prior to admission he had noticed dyspnea on very slight exertion and edema of the ankles that had necessitated cutting his slippers.

Examination revealed that the blood pressure measured in millimeters of mercury was 128 systolic and 90 diastolic and the pulse rate was 96 beats per minute. The heart was enlarged, the rhythm regular, and there was a rough systolic murmur at the apex transmitted to the axilla. The liver was enlarged moderately. Roentgenographic and roentgenoscopic examinations of the thorax revealed cardiac enlargement, prominence of the pulmonary conus, and passive congestion. A clinical diagnosis of rheumatic endocarditis was made. The patient was dismissed October 27, 1938, in good condition.

November 15, 1938, the patient began to have daily fever of 0.5° F. with generalized aching pains. In December, 1938, he experienced severe episodes of chills and a temperature of 103° F.; these episodes recurred every four or five days. February 13, 1939, the patient returned to the clinic acutely ill with râles at the bases of both lungs and marked edema of both ankles. The heart was very large, the rate 120, and rhythm regular. Urinalysis revealed albumin grade 1, occasional granular casts and erythrocytes. The concentration of hemoglobin was 8.7 gm. per 100 c.c. of blood and erythrocytes numbered 3,020,000 and leukocytes 9,000 per cubic millimeter.

A clinical diagnosis of congenital heart disease with subacute bacterial endocarditis was made.

February 18, 1939, a blood culture showed green-producing streptococci, four colonies per cubic centimeter of blood. In spite of digitalization dyspnea and edema rapidly became worse. Orthopnea and ascites developed, the patient became disoriented and died suddenly February 19, 1939.

At postmortem examination the right and left pleural cavities each contained 500 c.c. of cloudy, straw-colored, fibrinous fluid. Both lungs showed decreased crepitations with increased frothing and edema. There were two regions of infarction in the upper lobe of the right lung measuring 4 by 2 cm. and 5 by 2 cm. respectively and another region of infarction in the upper lobe of the left lung measuring 6 by 4 cm. The transverse diameter of the pericardium was 13.5 cm., and the pericardial sac contained 300 c.c. of clear, straw-colored fluid. The heart weighed 575 gm. There was a "soldiers' spot" 1 by 0.4 cm. on the anterior

Fig. 3. Interauricular septal defect with vegetation involving the defect; hypertrophy of the right ventricle.

surface of the left ventricle and another "soldier's spot" 2 by 3 cm. on the posterior surface of the right ventricle. There were vegetations on the mitral valve, which showed stenosis, grade 2, and insufficiency, grade 1, with marked shortening of the chordae tendineae. The interauricular septum was patent, the opening measuring 3 by 4 cm. A large vegetation was found directly in the open interauricular septum (Fig. 3). There were dilatation, grade 2, and hypertrophy, grade 3, of the right ventricle. The left ventricle revealed hypertrophy, grade 2, and the coronary arteries were sclerotic. Diameters of the cardiac valves were as follows: aortic valve, 5.5 cm.; tricuspid valve, 14 cm.; pulmonic valve, 10 cm. The depth of the left ventricle was 8.7 cm., the thickness of the wall of the left ventricle 1.8 cm.; the depth of the right ventricle was 9.3 cm. and thickness of the right ventricular wall 0.6 cm. Chronic passive congestion of the liver, grade 2, and fibrinous perisplenitis, grade 1, were present.

Comment.—This case is of particular interest for several reasons. A clinical diagnosis of congenital heart disease was made on the basis of the history of a murmur since infancy, the enormous hypertrophy of the right side of the heart, and the presence of a large pulmonary conus. Since the septal defect was associated with mitral stenosis, this case is another example of Lutembacher's disease. By far the most interesting aspect of this case is the presence of subacute bacterial endocarditis, an unusual complication of interauricular septal defects. To our knowledge,

Fig. 4. Interauricular septal defect.

this is the second case ever reported in which the vegetations involved the septal lesion.

Case 3.—A man sixty-three years old was admitted to the clinic in December, 1927. In the course of physical examination the only clinical sign pertaining to the heart was a soft systolic murmur in the aortic region. January 7, 1928, the patient died suddenly of an entirely unrelated surgical condition.

At postmortem examination the anterior edges of the left lung were found adherent to the pericardium which measured 12 cm. in its transverse diameter and contained 75 c.c. of clear yellow fluid. The heart weighed 345 gm. The endocardium and valves were essentially normal except for the right and left coronary cusps of the aortic valve which contained irregular nodules of calcium deposit on the inner wall. The foramen ovale was almost completely open. On the left side of the interauricular septum there was a membranous flap attached posteriorly and open anteriorly, which, when elevated, showed an opening of 2 cm. in diameter (Fig. 4). This flap was held in place by thin strands of membrane. There was sclerosis, grade 2, of the coronary vessels. The diameters of the valves of the heart were: aortic valve, 6.5 cm.; mitral valve, 8.5 cm.; tricuspid valve, 8.7 cm. and pulmonic valve, 6.5 cm. The depth of the left ventricle was 7.5 cm., and the thickness of the left ventricular wall 1.2 cm.; the depth of the right ventricle was 7 cm., and the thickness of the right ventricular wall 0.4 cm. Histologic examination of the left ventricle revealed an increase in connective tissue, especially marked between the fasciculi and the individual muscle fibers, which were hypertrophied.

Case 4.—The patient was a woman fifty years old. Only the interesting postmortem findings in this case are presented. There was a pigeon breast deformity of the thorax. The pericardial sac measured 12 cm.

Fig. 5. Interauricular septal defect.

in its transverse diameter and contained 75 c.c. of clear yellow fluid. The heart weighed 342 gm. The appendages, endocardium, and valves were normal. There was an interauricular septal defect measuring 3 by 2.5 cm. Both auricles and ventricles showed dilatation, grade 3 (Fig. 5). In the interventricular septum, 1 cm. below the right posterior commissure of the aortic valve, there was a region of marked thinning 0.6 cm. in diameter, but there was no patency of this septum. Diameters of the cardiac valves were: aortic valve, 6.5 cm.; mitral valve, 11.5 cm.; tricuspid valve, 14.5 cm. and pulmonic valve, 7 cm. The depth of the left ventricle was 11 cm., and thickness of the left ventricular wall 1 cm.; the depth of the right ventricle was 12 cm., and thickness of the right ventricular wall, 0.6 cm. Marked generalized edema of both lungs and congestion of the liver were present.

Histologic examination revealed a small area of chronic myocardial infarction on the anterior surface of the right ventricle. Both lungs, the suprarenal glands, the liver, and the right kidney revealed passive congestion; an old healed infarct was found in the right kidney.

Pathologic Features

Interauricular septal defect is the result of failure of development and union of the three embryonic anlagen: the endocardial cushions, the septum primum, and the septum secundum. Originally the atrium is a single cavity. From the superior portion of this cavity the primary septum grows down to meet a much smaller sep-

tum, called the "endocardial cushions," which has developed from the inferior portion of the single atrium. The fusion of these two septums obliterates the ostium primum or primary communication between the auricles. Then an opening known as the "foramen ovale," or ostium secundum, is formed in the primary septum, thus reestablishing the communication between the auricles. Later in the development of the fetus another septum, the septum secundum, grows down to the right of the primary septum. The foramen ovale is obliterated after birth by the fusion of this septum secundum with the primary septum. If the primary septum and the endocardial cushions fail to fuse the resulting defect is called a persistent ostium primum. If the union of the primary septum and the septum secundum fails the defect is called a persistent ostium secundum or patent foramen ovale.

This congenital lesion may occur as a single lesion. It frequently is combined with mitral stenosis, or it may appear in association with other congenital cardiovascular malformations. There is a difference of opinion concerning the relation of the mitral stenosis and the septal defect in many of these cases. Lutembacher expressed the belief that mitral stenosis is congenital in origin and produces an increased pressure in the left auricle which prevents the septum from closing, making the septal lesion a secondary one. Most authors, including Roesler and McGinn and White have expressed the opinion that the septal defect is the primary lesion and that the mitral endocarditis is an acquired and coincidental lesion. The latter view is the more feasible because approximately 25 per cent of cases of rather marked interauricular septal defect are uncomplicated by any mitral lesion.

In the presence of interauricular septal defect there are, aside from the septal defect, several other characteristic changes in the heart. The right auricle and ventricle are markedly hypertrophied and dilated, dilatation usually exceeding hypertrophy. The left auricle and ventricle usually are relatively small. Even in those cases complicated by mitral stenosis there may be no hypertrophy or dilatation of the left auricle because the septal defect relieves the pressure in this auricle and places the burden on the right side of the heart. Dilatation and hypertrophy of the pulmonary artery are so great that this artery almost always is larger than the aorta.

Clinical Findings

Since the pressures within both auricles are practically equal there is no reason to believe that there is very much admixture of blood in spite of a defect in the septum. When the septal defect is complicated by mitral stenosis the pressure in the left auricle is higher than in the right, and there is an arterial to venous shunt. Therefore, in the absence of congestive failure, if any appreciable admixture of blood occurs it is from the arterial to the venous side, and cyanosis does not occur. However, if an additional burden suddenly is placed on the right side of the heart by increasing the pulmonary pressure, there frequently develops a so-called effort-cyanosis, because the hemodynamic mechanism temporarily is changed, causing a shunt from the venous to the arterial side. This congenital defect has been classified by Bard and Curtillet, and Abbott as "cyanose tardive," because permanent cyanosis is present only in the very late stages of the disease, when cardiac decompensation has supervened, causing increased pressure in the right auricle and therefore a right to left shunt of the blood. Approximately a third of the blood must be shunted from the venous to the arterial side before cyanosis is produced. Clubbing rarely is observed in cases of uncomplicated interauricular septal defect. A deformity of the left side of the thorax is usually present. Tausig, Harvey, and Follis spoke of the characteristic appearance of these patients, who have delicate, semi-translucent skin, and are of slender build with light bony structure; this so-called gracile habitus was not present in our cases.

Thrills may or may not be observed. When present they may be systolic or diastolic and usually are felt in the pulmonic region. Murmurs are also inconstant and variable. The most frequent finding is a systolic murmur that may simulate closely the murmur associated with interventricular septal defects, but it is not so constant, is usually higher, and not so intense. This systolic murmur usually is heard best in the second or third interspace just to the left of the sternum. In the absence of congestive failure the pulmonic second sound is louder than the aortic, but this sign is of no value in those cases complicated by mitral stenosis. Because of the hypertrophy and dilatation of the right auricle and ventricle, which causes a counter-clockwise rotation of the organ, the heart clini-

cally is enlarged both to the right and to the left of the sternum. Pulsation of the liver and of the cervical veins frequently is observed, particularly when the condition is complicated by a relative tricuspid insufficiency.

The electrocardiogram usually shows a right ventricular preponderance and high P waves. According to Graybiel and White the most pronounced degree of right ventricular preponderance is observed in three conditions: congenital dextrocardia, auricular septal defect, and the tetralogy of Fallot. In contrast to other types of congenital heart disease in which auricular fibrillation occurs infrequently, this arrhythmia very commonly is observed in cases of interauricular septal defect.

The only constant and reliable antemortem findings are those elicited by roentgenographic and roentgenoscopic examinations which reveal an enlarged, globular heart (most of the enlargement being in the right auricle and right ventricle), a very small aortic knob, a greatly enlarged pulmonary arch, and wide hilar shadows that frequently pulsate. Occasionally these enlarged hilar vessels are misdiagnosed tuberculosis, aneurysm, or tumor. Cramer and Frommel, and Lutembacher expressed the belief that the typical "cœur en sabot" configuration frequently is seen. This contour, however, is not present in uncomplicated cases.

Complications

In 75 per cent of the cases of interauricular septal defect reviewed by Roesler, valvular lesions were observed. In 68 per cent of the twenty-two cases reviewed by one of us (Tinney) there were chronic valvular lesions, 50 per cent of which were mitral stenosis. There is a much higher incidence of chronic valvular disease in association with this congenital septal defect than in association with any other type of congenital cardiovascular malformation. There is no good explanation for the fact that this defect is the only congenital cardiovascular lesion occurring commonly with mitral stenosis, an association frequently referred to as "Lutembacher's disease." This combination of lesions, however, had been described by many observers prior to Lutembacher's comprehensive study of the subject in 1916. Martineau,¹⁴ in 1865, mentioned the first case of interauricular septal defect associated with mitral stenosis. This study was followed by

many similar observations by other French authors, and in 1915, Abbott described two cases of interauricular septal defect, one of which was complicated by mitral stenosis.

Roesler was able to find only one case of chronic pericardial disease in his series and felt that this complication rarely occurred. Since Roesler's review there have been three cases reported that were complicated by chronic pericarditis, and Bedford, Papp, and Parkinson recently expressed the belief that "adhesive pericarditis" frequently is found in association with interauricular septal defects, but they did not explain what they meant by this term.

In contrast to the frequency of subacute bacterial endocarditis in association with other types of congenital heart disease, this complication rarely is found in cases of interauricular septal defect. Roesler, Taussig, Harvey, and Follis, and Joly denied its existence in association with this anomaly. In 1906 Griffith reported a case of this type in which vegetations were confined to the pulmonic and tricuspid valves. Jacobius and Moore mentioned the only reported case in which vegetations were localized to the septal defect and the mitral valve. In one of the cases reported by Bedford, Papp, and Parkinson the vegetations were found in the left auricle but involved neither the defect nor the mitral valve. For this reason our second case is of particular interest, because it is the second case to be reported in which the vegetations involved the septal defect.

The frequency of auricular fibrillation in cases of this congenital malformation in contrast to its rarity in cases of other congenital cardiovascular anomalies has already been mentioned. This frequency can possibly be explained by the high incidence of chronic valvular lesions, particularly mitral stenosis. Bedford, Papp, and Parkinson were unable to find any report of auricular fibrillation in association with uncomplicated interauricular septal defect among persons less than fifty years of age. One of us (Tinney) reported an uncomplicated case of this defect in which auricular flutter was present; the patient was forty-seven years of age.

Death fairly frequently occurs in cases of this type as the result of pulmonary infections, pulmonary emboli, or cardiac decompensation. When cardiac decompensation occurs it is due to failure of the right ventricle and is characterized by an

enlarged pulsating liver, engorged cervical veins, peripheral edema, ascites and late cyanosis. Pulmonary congestion and dyspnea are not conspicuous until the terminal stages.

Prognosis

It is difficult to say very much about the prognosis of interauricular septal defect *per se*, since approximately 75 per cent of all cases are complicated by chronic valvular lesions. Roesler divided his series of cases into two groups and observed that there was practically no difference in prognosis between the uncomplicated cases and those cases in which the defect was associated with chronic valvular lesions. Roesler noted that the average age of all the patients was thirty-six years or more; in twenty-four cases reviewed by one of us (Tinney) the average age of the patients was thirty-seven years. Pepper and Horack described a patient who died at the age of seventy-seven years; they believed this patient to be the oldest ever described in the medical literature, but Tarnower and Woodruff previously had written about a patient aged seventy-seven years. The average age of our four patients is fifty years; the youngest patient is thirty-six years old.

Summary

Four cases of interauricular septal defect have been presented. Two of these cases were complicated by mitral stenosis. One of them, the second such case ever reported, was complicated by subacute bacterial endocarditis, with vegetations involving the septal defect.

Aside from the septal defect the characteristic pathologic features are marked hypertrophy and dilatation of the right auricle, the right ventricle, and the pulmonary artery. The left auricle, the left ventricle, and the aorta are relatively small.

The most important and reliable clinical findings in the presence of interauricular septal de-

fect are those elicited by roentgenographic and roentgenoscopic examinations which reveal an enlarged, globular heart (most of the enlargement being in the right auricle and right ventricle), a very small aortic knob, a greatly enlarged pulmonary arch, and wide hilar shadows that frequently pulsate.

HEAT-RESISTANT BUTTER DEVELOPED BY ARMY

A new "butter" developed by the Army Quartermaster Corps can be shipped without refrigeration and will resist temperatures up to 110 degrees Fahrenheit. Ten thousand pounds have already been shipped to U. S. troops overseas.

Named "Carter spread" after its inventor, Lt. Col. Robert F. Carter of the Quartermaster Corps, the new butter consists of dairy butter fortified with hydrogenated cotton seed oil flakes to raise its melting point. Quartermaster Corps officers say it still tastes like butter.—*Science News Letter*, April 25, 1942.

CLINICAL-PATHOLOGICAL CONFERENCE

◆ MINNEAPOLIS GENERAL HOSPITAL ◆

Frank C. Andrus, Pathologist

Presentation of a Case

DR. F. MOOSNICK: The case is that of a fifty-nine-year-old white male who was admitted to the hospital for the first time on December 10, 1941, complaining of back pain, weakness, and weight loss. He dated the onset of his symptoms to an attack in the fall, some three months before. He had the typical findings of an upper respiratory infection with wheezes in his chest, coughing, fever, and chills. He was confined to bed for a short while at that time. After the acute illness was over, he retained a chronic cough which was usually nonproductive, although he had expectorated slightly purulent sputum at times. He also complained of back pain and lumbar pain on the right which did not radiate but was dull and constant in character. The pain was increased by walking and moving. From the time of the onset of the attack in the fall, he had noted profound weakness to such a degree that he was unable to do any work and soon had to give up his usual occupation. It might be added that in his occupation as a painter he had come in contact with many kinds of paints and had not been overly careful in using or mixing them. Since the onset, although he noted no anorexia, he was unable to tolerate foods and lost 20 to 25 pounds in weight. His past history was not remarkable. He had undergone appendectomy some years ago. He had now a hernia at the site of the old incision. The family history was noncontributory. His father and mother were long-lived individuals, his father dying of heart trouble at seventy years and his mother at a similar age of Parkinsonism.

Physical examination revealed a temperature of 98.2 degrees, pulse 96 per minute, respirations 20 per minute, and blood pressure 104/70. He was well developed and well nourished and exhibited no evidence of the weight loss of which he had mentioned. The head, neck, and abdomen were negative. There was some tenderness over both sacro-iliac joints especially on the right side. Examination of the chest revealed wheezes and sibilant râles over the left upper lobe which disappeared after a few coughing spells.

Laboratory Data: The hemoglobin was 81 per cent, erythrocyte count 4,200,000, and leukocyte count 9,050 with a normal distribution. Blood morphology studies with particular reference to basophilic stippling were done, but were negative. The tests for syphilis were negative. The urine was negative. The sputum was examined for acid fast bacilli, but none were found. One of the specimens contained streaks of blood, and all were positive for occult blood. Stool examinations, however, were negative. X-ray studies had been done in the Out-Patient Department immediately before ad-

mission and had revealed some hypertrophic changes in the lumbar spine which were regarded to be sufficient to account for his low back pain. In addition, the chest film showed an increased density in the left upper lobe which the roentgenologist interpreted as atelectasis or some type of inflammatory reaction. The remainder of the lung fields were negative. X-rays two weeks later showed some clearing of the process along the lateral border of the heart. The impression was that the patient had some kind of an acute inflammatory process which was resolving. Although there was some clearing, density persisted. Bronchoscopy, done during the hospital admission, was reported as negative. His further course was uneventful. He coughed very little bringing up about one fourth a cup of mucoid sputum each day. The back pain cleared with bed rest and he was discharged.

He was followed in the clinic. He gained 25 pounds in weight and felt well. The back pain cleared but he did not feel well enough to go back to work at any time. His chest was x-rayed again but the findings were not particularly impressive at that time. He continued along this course until the middle of this year at which time he had a sudden onset of a series of chills followed by bouts of fever. These attacks came on in the evening, usually occurred daily, and were followed by fevers up to 103 degrees. He had no sweats and his temperature dropped by the next morning. With this he had severe malaise and marked aching in his muscles. His cough which he had complained of at first and which had cleared, returned and was now dry and hacking. Because of the persistence of these complaints, he was readmitted to the hospital in July, 1942.

Physical examination now revealed a temperature of 101 degrees, pulse 80 per minute, respirations 20 per minute, and blood pressure 102/66. There was some evidence of weight loss and the patient appeared dehydrated. Physical examination was negative except for the chest findings. There was an impaired percussion note over the left upper lobe and to a certain degree at the left base. The breath sounds were increased over most of the left chest with increase in bronchial elements and prolonged respirations. In addition there were crackling râles at the left base posteriorly which cleared slightly on deep breathing, but which did not clear entirely.

Laboratory data: The hemoglobin was 81 per cent and the leukocyte count 5,950. The urine was essentially negative and the blood culture yielded no growth.

Agglutination tests were done but were all negative. Four sputum specimens were again examined for tubercle bacilli, but none were found. The sedimentation rate was 109 mm. in one hour. An electrocardiographic tracing was negative.

The patient was then bronchoscoped and a small tumor mass was found in the bronchus leading to the left lower lobe.

Clinical Diagnosis: Bronchogenic carcinoma.

DR. FRANK ANDRUS: We will now project a slide of the biopsy. Here we see squamous epithelium which is quite undifferentiated, does not have a clear lower border and appears to be invading. As you remember there are three main histologic types of bronchogenic carcinoma. There is the squamous type which is said to be more apt to give rise to ulceration of the bronchus and to formation of a lung abscess. Then there is the small cell or undifferentiated carcinoma. This latter type usually arises near the hilus of the lung and metastasizes quite readily to the lymph nodes. The third kind is the adenocarcinoma. These varied histologic types give rise to different clinical forms. One of them is the picture we are seeing with infiltration at the hilus of the lung. Another type produces a massive consolidation of one lobe and appears much like a pneumonia on x-ray and grossly. Another type produces multiple miliary lesions scattered throughout both lungs; and still another occurs near the periphery of the lung and often gives massive infiltration to the pleura.

I think that most of us now regard that the so-called "pleural endotheliomas" are actually bronchogenic carcinomas. A careful history is of utmost importance in the diagnosis of bronchogenic carcinoma. Whenever a pleural effusion, empyema, or lung abscess is seen which appears insidiously, and not as a complication of pneumonia, a bronchogenic carcinoma should be suspected especially when the patient is in the older age groups. Occasionally the patient gives a history of repeated attacks of pneumonia which actually represent episodes of pulmonary atelectasis. When we keep these things in mind, we will have a much earlier diagnosis of bronchogenic carcinoma.

DR. PEPPARD: In regard to the clinical story of bronchogenic carcinoma, what Dr. Andrus just said about the various types accounts for the many differences in the clinical picture and x-ray findings. Carcinomas will stimulate almost any kind of pulmonary disease at times. We are now a little more alert to bronchogenic carcinoma and not quite so apt to pass it up because of not thinking about it. Very often the prominent symptoms of which the patient complains are that of an associated lesion, and one of the common ones is that of atelectasis. Pleural involvement is significant. I went through a series of cases here at this hospital and, while I was aware of its importance, I was rather surprised to see the frequency in which diagnosis was made by the examination of blocks of tissue made from the sediment of the pleural fluid. Several patients had more than one bronchoscopic examination without the diagnosis being established.

DR. ANDRUS: Even in the best hands, bronchoscopic biopsy is positive for tumor in only about one-half of proven cases.

There are other types of bronchogenic tumors that we might mention. One is the type described by Pancoast where the primary tumor is in the superior pulmonary sulcus which then involves the cervical sympathetic and gives rise to a Horner's syndrome and which may invade the brachial plexus to give atrophy to the upper extremity on that side. Another tumor is that seen most often in young individuals, and is that of a benign adenoma of the bronchus which some people call Grade I carcinoma. These produce obstruction and intermittent atelectasis which is sometimes complicated by lung abscess. There are other rare bronchial tumors. On one occasion the bronchoscopist cut out a piece of cartilage and we thought that he was taking out a piece of the normal bronchus cartilage but it turned out that the patient had a primary chondroma of the bronchus. Another tumor was a spread from the hypernephroma which metastasized to the lymphoid tissue underlying the mucosa, producing a polypoid growth which projected into the bronchus. Another one was a metastasis from a gelatinous carcinoma of the colon which had previously been resected. This also produced obstruction to the bronchus and atelectasis.

DR. PEPPARD: From a series of 7,685 autopsies at the Cleveland City Hospital the lung was the second most frequent site of origin for primary malignancy, being preceded only by the stomach. In a series of 6,800 from Cook County Hospital, pulmonary carcinoma was third, stomach being the first and the intestines the second. Locally here at the Minneapolis General Hospital from 1935 to 1939 there were 20 cases out of 63,936 admissions, one bronchogenic carcinoma to every 3,129 admissions. At St. Mary's Hospital, Minneapolis, there were 14 cases out of 26,301 admissions, a ratio of almost double over that here, 1 to 1,878. At Glen Lake Sanatorium from 1916 to 1939 there were 17 cases out of 6,343 admissions making a ratio of 1 to 373 cases. From 1935 to 1939 Asbury Hospital, Minneapolis, had 17,424 admissions with 11 cases, a ratio of 1 to 1,584. This gives us an idea of the frequency of primary pulmonary cancer.

A STUDENT: How often do these tumors metastasize to the brain?

DR. ANDRUS: Quite often. Tumors of the lung go to the brain more commonly than any other tumors. The reason for this is apparently because most tumors give rise to emboli which have to go through the lung to get out into the greater circulation, whereas a tumor in the lung does not have to go through the pulmonary circulation but goes directly into the greater circulation. The lung is perhaps the most common source of metastatic brain tumors. It is so common a source that experienced neuro-surgeons routinely examine the lungs when a patient presents himself with a brain tumor.

HISTORY OF MEDICINE IN MINNESOTA

HISTORY OF THE MINNESOTA STATE MEDICAL SOCIETY

By ARTHUR S. HAMILTON, M.D.

Minneapolis, Minnesota

(Continued from July Issue.)

Thirtieth Annual Meeting

The thirtieth annual meeting of the Minnesota State Medical Society was held in Saint Paul, June 15, 16, and 17, 1898, the president, Dr. John F. Fulton, presiding.

The various routine matters necessary were taken care of with some differences of opinion and considerable time was thus consumed. The committee on diphtheria antitoxin which was continued from the previous meeting reported that "Antitoxin is so well recognized and settled as a necessary factor in the treatment of diphtheria . . . that detailed information would be valueless . . . Perhaps no remedy ever came to trial that stood the test and became standard so soon. . . . The value of the remedy is almost without parallel in the annals of medicine."

Thirty new members were admitted to the Society and various committees were appointed to preside over the sections.

The committee, appointed at the previous meeting to see whether something could be done to improve the laws relating to the office of coroner and those relating to expert medical testimony, made a lengthy report. They presented the bills regarding these laws which were introduced in the last legislative session at their request. Both bills failed but the committee stated that they were not discouraged and believed continued efforts should be made to reform the laws relating to these matters.

The Spanish-American War was in progress at this time and the remission of dues of members of the Society who were in the army was passed, as well as those who had paid dues for twenty-five years.

Dr. Fulton, in his presidential address, outlined the advances being made in medical education and praised the work that had been done in elevating the requirements before admitting a physician to practice his profession. He noted also the fact that these advanced requirements would soon eliminate the commercial and poorly equipped medical schools.

Forty-seven papers were read at this meeting, a number of these being case reports. Most of these latter were by younger men. Ophthalmology, Otology, and Laryngology which hitherto had been part of the Section on Surgery now existed as a separate section. Surgical papers were not as numerous as they had been in the past but the question of appendicitis still raged, particularly as to the time for operation. The Gynecology Section presented a symposium on extra-uterine pregnancy.

The three longest and most extensive papers presented were those on "Medical Education" by Dr. L. M. Crafts, "Medical Expert Testimony" by Dr. J. H. Dunn and "Artificial Immunity" by Dr. D. O. Thomas.

Many papers on laboratory methods of diagnosis were presented. It was about this time that laboratory work of this kind was beginning to be used in Minne-

sota, such as blood examinations, microscopic examination of the urine, the Widal reaction and the Diazo reaction.

All the papers were adequately discussed but at this meeting those who previously had prepared papers apparently stepped aside and gave others the opportunity to express their views.

Dr. F. A. Dunsmoor of Minneapolis was elected as the succeeding president.

Thirty-first Annual Meeting

The thirty-first annual meeting of the Minnesota State Medical Society was held in Minneapolis June 21, 22, and 23, 1899, Dr. F. A. Dunsmoor presiding.

The minutes of this meeting are more extensive than any of the previous sessions due particularly to relief of the physicians who suffered losses in the cyclone which destroyed New Richmond, Wisconsin, and the exertions of the osteopathic physicians to influence the legislature to make them eligible to practice their cult as legal practitioners of medicine.

Doctor Dunsmoor, in his presidential address, stressed the necessity of the profession to follow the ideals of professional ethics, to stand united against all chicanery and undignified practices, and to keep abreast of the latest advances in medical knowledge, both clinical and public hygiene.

The Society was now a large organization and the difficulty of providing time for the presentation of all papers offered presented difficulties. It was necessary to limit the time allotted to each speaker to overcome this difficulty. In all, forty-seven new members were admitted.

Because of the time limit placed on the reading of papers more than usual were presented, fifty-one in all. These were divided as follows: Medicine, thirteen; Neurology, four; Surgery, sixteen; Ophthalmology, Otology, and Laryngology, five; Gynecology, five; Obstetrics, six.

The papers presented by outsiders by invitation were delivered by Dr. John V. Shoemaker of Philadelphia on "The Psychological and Medical Treatment of Insomnia," and by Dr. Franklin H. Martin of Chicago on "Retroversion of the Uterus." These were well received and discussed.

Dr. T. C. Clark reported on "Observations on the Medical Service of the Late War." Many inadequate methods of procedure had been started and it was hoped that abuses then prevalent would be corrected.

Dr. George D. Head presented an admirable paper on "Tuberculin as a Diagnostic Agent" and Dr. Frederic Leavitt read an excellent paper on "Smallpox," illustrated with photographs.

Many other excellent and well-presented papers were submitted and caused considerable discussion. It is of interest to note that many of the best were short, the authors avoiding elaboration of nonessential verbiage.

Thirty-second Annual Meeting

The thirty-second annual meeting of the Minnesota State Medical Society was held in Duluth June 27, 28, and 29, 1900, Dr. Walter Courtney of Brainerd presiding.

The routine matters of the meeting were quickly attended to. The only thing of interest was a motion, which was carried, that an effort be made to prevent the paying and receiving of commissions on cases referred by one practitioner to another. There was no debate on this motion.

As the American Medical Association was to meet in Saint Paul the next year a committee was appointed to arrange for the succeeding meeting, as some changes might be necessary.

Doctor Courtney, in his presidential address, reviewed the progress of medicine

during the past few years of the century and in addition mentioned some of the recent innovations in medical practice which he thought were objectionable in medical education, medical expert testimony, legislation, advertising and commissions.

Fifty-one new members were admitted to the society at this session, being the largest number admitted in one year. The transactions of this meeting were printed in octavo, smaller in size than those previously published.

Only twenty-seven papers were presented at this meeting. Apparently the Program Committee believed that a few well prepared papers were preferable to a larger number of smaller papers and case reports.

Dr. George D. Head, chairman of the Medical Section, presented "The Value of the Newer Signs and Procedures in Diagnosis." Dr. J. W. Bell presented "The Early Diagnosis of Pulmonary Tuberculosis." These were lengthy papers and were well presented and thoroughly discussed.

The State Board of Health presented two papers, one by Dr. Reynolds on "State Work with Infectious Diseases of Animals," and "Rabies in Minnesota" by Dr. L. F. Wesbrook.

In the Surgical Section, Dr. J. H. Dunn discussed "Penetrating Wounds of the Chest." Dr. Andrew J. Coey of Chicago, the only outside visitor, discussed "Blood Count in Surgical Diagnosis." This was a good paper but was much the same as that presented in 1899 by Doctor Head. Dr. C. H. Mayo presented a paper on "Varicose Veins," and Dr. C. A. Wheaton spoke on "Lymph Nodes as a Factor in Diagnosis." These papers were adequately presented and excited considerable discussion. For the first time the transactions contain an index.

We have now reached the end of the nineteenth century where our history for the present ceases. On reading the papers presented during the preceding thirty years the progress of medicine is well shown. It is to be regretted that practically all of those prominent in medicine in Minnesota during these years have passed beyond, but their influence on Minnesota medicine is still a pleasant memory and their contributions are well remembered today.

OFFICERS OF THE MINNESOTA STATE MEDICAL SOCIETY

1869-1900

<i>Year</i>	<i>President</i>	<i>Secretary</i>	<i>Treasurer</i>
1869-1870	Samuel Willie	A. Wharton	S. B. Sheardown

†The office of Corresponding Secretary was discontinued in 1889 and was replaced by the office of Recording Secretary.

*Dr. Witherle completed the unexpired term of Dr. Sheardown who died while in office.

HOSPITAL SERVICE ENROLLMENT

A total of one-half million hospital service subscribers will be reached by fall, in accordance with an announcement made at a recent meeting by James McNee, superintendent of St. Luke's Hospital, Duluth, and president of the Minnesota Hospital Service Association.

"The Minnesota Hospital Service Association, which is observing its ninth anniversary this year," said Mr. McNee, "expects to reach an enrollment of one-half million subscribers by fall.

"We begin our ninth year with a record payment of \$5,773,499.00 in hospital service for our subscribers. Since 1933, 190,164 subscribers have been hospitalized.

"In 1942, alone, it is estimated that over \$1,000,000.00 will be paid to hospitals for subscriber hospitalizations. This means that 83 per cent of this year's income will be returned to the subscribers in the form of hospital service," he stated.

"An interesting fact is that 70 per cent of the Minnesota Hospital Service subscribers in the Twin Cities area use more expensive accommodations than the three or four-bed room accommodations. This indicates that where a hospital service contract relieves expense, people prefer using higher priced accommodations," concluded Mr. McNee.

At the same meeting, Arthur M. Calvin, executive director of the Association, made a comparison of the Plans present size with its size in 1933. He said, "At the end of our first year of operation, there were but 2,000 subscribers enrolled and there were only seven

contracting hospitals. These hospitals were all located in Saint Paul. Today, we have 483,000 subscribers and 102 hospitals in Minnesota are affiliated with the Plan.

"With the recent enrollment of the Twin City Ordnance Plant and the Gopher Ordnance Plant Area Engineers, all the defense plants in the Twin Cities have hospital service groups," said Mr. Calvin.

"Our Plan, with seventy-one other non-profit Blue Cross Plans in the nation, forms a vital part of the national defense program, and has recently been endorsed by the Office of Defense Health and Welfare Services.

"It is because of the wholehearted coöperation of civic leaders, employers, employees, hospitals and the medical profession that the Blue Cross Plan has become an important part of community life in Minnesota.

"Because of the unselfish interest of the press and radio stations in the state, thousands of persons in Minnesota have become acquainted with our non-profit Blue Cross Plan for hospital care," Mr. Calvin concluded.

The purpose of the Minnesota Hospital Service Association is to provide hospital service to groups of employed persons. However, subscribers who enter the armed forces may continue their contracts for the benefit of their dependents at a reduced rate. If the subscriber has no dependents, he may suspend his contract while he is in service. When he returns to civilian life, he may reinstate his contract without loss of benefits.

President's Letter

DUES DURING THE WAR EMERGENCY

TWO years ago the Council recognized that physicians in service should be maintained in active membership and announced the policy of encouraging local or component societies to carry the dues of their members who were in active service. This was done in almost all of the societies. Later it became evident that some of the larger societies could not do this and properly maintain their necessary local activities. A year ago, therefore, the House of Delegates passed a resolution to the effect that the State Association should arrange for the payment of dues of those in service with the rank of Captain or below in the Army and Lieutenant Commander or below in the Navy, if so requested by the member concerned and the responsible officers of his local society. It appeared that even this plan would be less successful as more physicians were called into service, as the load became heavier, and as some societies were called on to make very large contributions in proportion to their incomes. Consequently, at the last session of the House of Delegates, after extended discussion it was decided that, in fairness to all physicians in the state, some method of equitable distribution of the financial load should be formulated. A temporary contribution, effective in 1943, of five dollars a year during the war emergency was proposed to help pay the dues of all medical officers. And I think I am correct in stating that this proposition was finally supported unanimously.

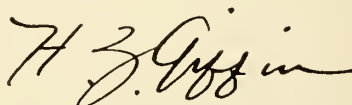

I am sure the members of the Association will accept without hesitation the decision of the House of Delegates to increase the dues for the period of the war emergency, particularly if they understand the necessity of such a decision and the fact that it was arrived at only after full and free discussion and mature consideration. It should be clearly understood that the additional contribution is temporary, and for the period of the war emergency only, which ordinarily means for the duration of war and for the period of adjustment after peace has been declared.

Preceding the adoption of the proposal, three questions especially were discussed at length: further economy in administration, possible curtailment in the activities of the Association, and the use of our reserve fund. Economy in administration has been practiced for years. As former chairman of the Finance Committee I am familiar with this practice. The unification of all administrative activities in one office under a full-time staff of exceptional ability led to a consistent annual saving. Moreover, few of the expenses of officers and committeemen are charged to the Association. Economy has been the watchword since the depression of 1932 in so far as it was consistent with the responsibilities of the Association to its members and to the public.

Curtailment in the activities of the Association can be accomplished in only a few minor fields. In general we must maintain our activities to fulfill our responsibilities. In fact, in certain fields our activities must be expanded to meet wartime demands. For instance, a very considerable expense has had to be assumed in connection with the Procurement and Assignment Service. Campaigns for public health and welfare must be actively maintained in order that epidemics may be prevented and as firm a foundation as possible may exist for recovery after peace has been restored.

Some of our reserve fund may have to be used. It is not large for such an important organization, about \$44,000. If 900 physicians are in service in 1943 our income will be reduced by \$13,500. Assuming a membership of 2,600, there will be 1,700 remaining who pay dues. The additional amount received from these 1,700 will be \$8,500 or \$5,000 less than we now receive. Consequently, even with the additional dues it will be necessary to economize where we can and to curtail our activities where it is possible. It may be advisable to utilize some of our reserve fund, but I sincerely hope that this will not be so. An organization of the size and importance of the Minnesota State Medical Association should by all financial criteria have a much larger reserve fund than we now possess.

I have discussed this subject frankly with you because every member is entitled to know the exact basis for the decision of the House of Delegates. Obviously all details cannot be presented in this short letter. If there are other questions in your mind on the subject I shall hold it an honor to correspond with you personally.

Volume 25 AUGUST, 1942 Number 8

THE NATIONAL PHYSICIANS' COMMITTEE

NEXT November the National Physicians' Committee will have been three years in existence. It is time to take stock and ask what is its record of accomplishment. Why, for instance, does the American Medical Association give this Committee its unqualified indorsement? For in the resolutions adopted at the recent Atlantic City Convention of the AMA were two noteworthy statements:

I. BE IT RESOLVED that we register our approval of the activities of the National Physicians' Committee for the Extension of Medical Service, commend the Board of Trustees and the Management of this institution for the efforts they have made to enlighten

the general public in connection with American Medicine's methods, progress and achievements, and in pointing out that the public has a vital interest in the final results.

II. BE IT RESOLVED that we, the House of Delegates of the American Medical Association, place ourselves officially on record as recognizing our responsibility for making the utmost effort to preserve the elements of independence and freedom of action that will make possible the easy reentry of physicians to civilian practice. To this end we recommend that a definite part of each program of every component Medical Society be devoted to a reconsideration of the traditions, the standards, the freedoms, the effects of the absence of restraints and outside controls which have contributed so materially to American Medicine's unequalled progress and vast achievements.

This second resolution indicates the necessity for the fight to maintain the traditions and principles of American Medicine which have made our country the healthiest in the world. It is this fight that the National Physicians' Committee has been waging. In these two and a half years, thousands of educational pamphlets which preached sound medicine and set forth the record of medicine in America have been broadcast over the country. About one hundred of the leading newspapers of the country carried a full-page advertisement of medical achievement. Two similar full-page statements appeared in the *Saturday Evening Post*, one coming out prior to the Republican National Convention, the other prior to the Democratic National Convention. At the present time there are being sent to over twelve thousand newspapers weekly releases of stories which help to educate the public in the principles of sound medical practice.

Such has been the work of the Committee. Now as to the results: Elimination of medical planks in the platforms of both Republican and Democratic Parties was due largely to the activities of the N.P.C. The same agency was partly responsible for the statement of the President of the United States at the dedication of the Government hospital at Bethesda, Maryland, upholding the preservation of American standards of medicine. Who can tell how far-reaching and powerful has been the influence of this campaign in public health?

During the past year the committee has made notable advances in forming supporting organizations in many states of the Union. As a result of this and with the backing of the two resolutions passed at the recent meeting of the House of Delegates of the American Medical Association, it is expected that the support of the activities of the N.P.C. will be greatly augmented. With increased funds N.P.C. is planning to enlarge its activities and make its influence felt even more prominently than in the past.

Is it worth your while to keep up the good work of the N.P.C.? Evidently Minnesota doctors have thought so. In the fiscal year just past, they contributed the largest sum given by the physicians of any state in the Union. Even Texas and Michigan trailed Minnesota. We believe that the work of this committee on a national scale is worthy of the continued support of the medical profession of the country.

The committee is making the following plans:

1. To issue a monthly Bulletin to all subsidiary organizations.
2. To engage the services of several men who will act as field men, visiting various organizations in the country and helping them in increased activities.
3. Among various other enterprises it is considering the development of legislative activities to safeguard the independence and freedom of American Medicine in the post-war reconstruction period.

It has in mind following some of the activities carried on by the Committee on Legislation in Minnesota, which are recognized as being pre-eminent in work of this kind. It also is planning an increased radio program during the fall and winter.

In order to do this, it will be necessary for those who have subscribed to the National Physicians' Committee to continue their active support. Otherwise, of course, this sorely needed agency will be unable to function. It would be greatly appreciated if all who have subscribed in Minnesota during the past year would repeat their subscriptions this year and if the men who have not subscribed would realize the great need of their active support. Plans are being made to carry on the campaign for additional subscriptions again this fall. In the meantime, if you

find it possible to subscribe now and would care to do so, make your check payable to the National Physicians' Committee, and send it to either one of the undersigned, who will then forward it to headquarters in Chicago, which in turn will send acknowledgment direct to you.

WILLIAM F. BRAASCH, M.D.

Secretary and

Member, Board of Trustees.

F. J. SAVAGE, M.D.

Chairman, Minnesota Division,
National Physicians' Committee.

THE DOCTOR IN SERVICE

WHEN war descended precipitately on our peace-loving people there was left no alternative but to assemble a huge army for our country's defense.

We know that modern armies are made up of men and machines. An adequate proportion of doctors must of necessity be with the men. Doctors are just as necessary to our own army as are doctors in the German or the Japanese or any other army. There is the same devotion to professional duty on the part of medical men, of any race, in all armies at war today; the art of healing knows no nationality.

Apathy on the part of the civilian physician toward assuming military duty is not unnatural. His training has not been with a military career in view. His life has been geared to a plan of practice in a day of peaceful pursuits. But after all, is it so very different? He relieves headaches, constipation, sore throats or appendicitis and takes these things as a matter of course in his daily round at home. But we must not forget that the boys in uniform have all these. And, too, the boy in uniform may be homesick or "jittery" or uncertain or confused about his military life, so new to him. He may even have fears he would disclose only to the doctor in his outfit. It is true that the man who has embraced the profession of medicine will always be a "doctor" in a certain personal sense to those outside the profession, even to the man in uniform. The patient who says, "I feel better, doctor, now that I have talked to you," may just as well be a man in uniform, and every physician knows how good that sounds to him.

A doctor's desire to serve with the troops is not all patriotism; it is more than that. It is his innate desire to render the same sort of service

to his fellow men in service that he has at home. The company, the battalion or other unit to which he is attached may be regarded as his village, town or city practice. He is the guardian of the health and well-being of these men. If he does it well and conscientiously they will render him the same loyalty and gratitude he received at home. The need of the troops for attending physicians is great. We hope that need will be rapidly met by physicians applying for commissions.

—A. N. C.

MORE ABOUT ENLISTMENT

THE lagging in voluntary enlistment of physicians in the Medical Corps of the army has been due to some misunderstanding as to the method of procedure. Some physicians who filled out certain official forms wherein they specified certain preferences in the various services had the impression they were applying for commissions. The lack of functioning on the part of the Procurement and Assignment Committees in designating who of the groups of physicians in the various county societies certified as nonessential to civilian practice should enter the service first still left the decision to each individual physician. The subject has been clarified since the State Medical Meeting in Duluth in June.

At that meeting the State Delegates agreed that all physicians under forty-five years of age should hold themselves in readiness to apply for commissions in the armed forces as the need should arise. They also agreed that for the present and until the emergency demands otherwise only those under thirty-seven years of age, with a few exceptions, would be called upon to apply for commissions.

In our last issue we suggested the advisability of establishing quotas for states and component county societies as desirable in determining how many physicians should be obtained from the various districts of the state. Apparently this has been done. While Minnesota is still some 400 short of its quota, it is not deemed advisable to obtain this many enlistments at once. Some 250 letters were sent out by the chairman of the State Procurement and Assignment Committee under date of July 14, to physicians under the age of approximately thirty-seven, who had been certified by the various county Procurement and Assign-

ment Committees, informing them that they had been selected for military service and suggesting that they apply for commissions as soon as possible. The names of these available physicians have been submitted to the Selective Service and Medical Recruiting Boards. The draft numbers of these men have already been called and the only reason these individuals have not already been called is because action of the Procurement and Assignment Committee has been awaited. This action was taken in order that the civilian population in certain districts need not suffer from lack of medical attention.

There need be no further cause for misunderstanding. These 250 men are those who the Committees on Procurement and Assignment feel should enlist. The decision no longer rests with the individual physician. Those who received this letter may feel assured that in the opinion of their confreres they can be dispensed with in civilian practice and it is proper for them to enlist. Doubtless the response will be satisfactory now that the atmosphere is cleared.

This war is no child's play. The armed forces need more doctors. The younger able-bodied doctors should be the first to enlist. Without a doubt those in the older age group of thirty-seven to forty-five also will be needed soon.

A doctor entering the army makes a sacrifice, financial and otherwise. The medical corps is no place for a conscientious objector, in spite of a recent assignment to the medical corps of a former prominent Hollywood star, who had declared himself a conscientious objector. The medical corps of the army and physicians in general should, and doubtless do, resent the implication. Admittedly a physician in the service is not likely to have as hazardous an assignment as a flying pilot or gunner, but upon enlisting he puts himself at the disposal of the Surgeon General as to where and how he shall serve. An enlistment in the Medical Corps is still proof of a physician's patriotism.

SELECTEES REJECTED BECAUSE OF TUBERCULOSIS

X-RAY examination of the lungs is a routine procedure for induction into the army and in the preemployment examinations for the Twin Cities Ordnance Plant. It is said that about 0.5 per cent of the many thousands who have so far been examined for induction into service in this

state have been turned down on account of pulmonary tuberculosis. Presumably this number includes arrested cases for they are not accepted into service.

This detection by x-ray of active or inactive cases of pulmonary tuberculosis in presumably healthy individuals affords an opportunity for the agencies, such as the State Board of Health and the Minnesota Public Health Association to contact these individuals, trace their sources of infection and follow their treatment.

With this purpose in view a meeting was called June 1, 1942, by the Minnesota Public Health Association and its two constituents, the Hennepin and Ramsey County Public Health Associations, for the discussion of the best method of procedure. In attendance were representatives of the State Board of Health, the Minneapolis and Saint Paul Boards of Health, the Medical Department of the Induction Center at Fort Snelling, the Medical Department of the Twin Cities Ordnance Plant, the State Rehabilitation Department of the Division of Social Welfare and the volunteer tuberculosis associations.

As a result of this conference it was arranged that those individuals with x-ray evidence of pulmonary tuberculosis encountered not only at the Fort, but at the plants at New Brighton and Rosemount will be reported not only to the State Board of Health, but to the Health Departments of the Twin Cities and presumably local health authorities in the rest of the state. Radiographs taken at the Fort are sent to local draft boards for the use of the rejected draftees and their private physicians.

In the interest of rehabilitation and the use of available manpower in the present emergency, it was brought out that many ordnance jobs which do not require much physical effort and with healthy atmospheric surroundings are ideal for those individuals with arrested pulmonary tuberculosis, providing periodical examinations are arranged for. This need not be done at public expense since ordnance employes can afford to pay for such examinations themselves. This arrangement is in their own interest as well as that of their fellow employes, and is already in effect in many industrial plants, where it works effectively.

With this evidence of coöperation on the part of army, ordnance and state and voluntary health organizations the wholesale examination of the

younger male population of the state may be made to aid the tuberculosis fight so that the downward trend in the mortality rate of this disease may continue during the coming years.

WAR SAVINGS BONDS

THE tempo of the nation's war effort has risen by leaps and bounds during the last several months. The battleline on which our American men are fighting extends to every continent. The supply lines are carrying tools of war in ever-increasing quantities from our shops and factories. The American spirit is geared to high pitch with the intent to hit full stride and get this business of war settled with Democracy the victor.

With the increasing intensity of effort comes also a pyramiding of cost. For the fiscal year 1943, the war program will require an estimated total of 70 billion dollars. Even with increased taxes, such revenues will fall far short of meeting the bill. Of the total war and nonwar costs of Government for this coming year, the Treasury Department will have to borrow some 52½ billion dollars on the basis of present estimates. To borrow in the best way possible is the goal.

Our fiscal program like our production line is directed toward the total war effort. The fiscal program, however, is designed not only to meet financial needs of the nation, but is concerned with broader economic requirements as well. Our national income has increased some 3 billion dollars a month over that of two years ago. The American public must defer the purchasing made possible by this increase until after the war, when the nation's productive plant is reconverted to meet consumer needs. That is one major reason why the Government has set the billion dollar a month quota for the purchase of War Savings Bonds.

The quota figure may seem a stringent demand since it calls for 10 per cent of all individual incomes, but this war can't be won by wishful thinking. And deferring one's spending until the post-war period is little in the line of actual sacrifice. The 10 per cent is not *given* to the Government. The money purchases securities upon which returns as high as 33⅓ per cent are paid when the bonds mature. Fulfilling our quota of bond purchases during each month as long as the war may last will go far in financing our war effort both adequately and beneficially to us all.

Tire, gasoline, and sugar rationing require adjustments in our everyday habits of living. It is no less necessary that the budgeting of dollars for War Bonds become a daily habit. Americans are fighting for total victory and we as a people are willing to invest in that victory. But this problem is no future problem—it must be met now by every American who receives wages and income.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics

of the

Minnesota State Medical Association

George Earl, M.D., Chairman

HOW AND WHEN

Current military needs for physicians—and how to fill them—superceded all else in the discussions of the delegates and officers of the Minnesota State Medical Association in their 89th annual session in Duluth.

The question at issue was not, shall we offer our services?—but how—and when—shall we offer them?

It was complicated by general misunderstanding of the function and scope of Procurement and Assignment and of the significance of the PAS classification “available,” as applied to physicians of military age.

When the heat of controversy had blown away all who participated agreed that the session had been stimulating and valuable, that misunderstandings had been cleared up and the way was open for Minnesota, already well in the forefront of the states, to complete its quota of medical officers for the army.

Misconceptions

Notable among misconceptions held by many of the older as well as younger members was this one to the effect that Procurement and Assignment committees should be expected to take into account family and financial considerations in classifying men as “available” or “not available.”

Family and financial considerations and physical condition are no part of the business of Procurement and Assignment committees. All such considerations belong to the individual and his Selective Service Board only. By regulation and special arrangement, the advice of the Procurement and Assignment Service is accepted by Selective Service Boards in one matter only—that of community need.

If a man is considered essential, by reason of the fact that he is alone in a community or he occupies a critical position on a hospital or teach-

ing staff, then the Procurement and Assignment Committee marks him unavailable and the Selective Service Board abides by that classification. If not, he is marked available and it is left to army medical examiners to pronounce upon physical condition and to Selective Service Boards to pass upon claims for dependency and other civilian obligations.

Recruiting Short-Cut

Another misunderstanding had its basis in Procurement and Assignment plans as originally published by the *Journal of the American Medical Association*. Many young men who have long since indicated on their questionnaires their willingness to serve with the armed forces were still waiting to be notified by Washington that they were needed. They did not understand that the Medical Recruiting Board had been set up as an emergency measure to expedite the original procedure and recruit the young men who were willing to serve immediately to meet the critical demands of the growing army.

The fact is, as army representatives pointed out in Duluth, that the recruiting methods of PAS from Washington, necessarily hampered by necessities for correspondence were too slow to meet the need. The recruiting boards were set up to fill the same function, but speedily, in order to get urgently needed doctors into the service.

Letter Sent

On the basis of the understanding reached in Duluth, the state Procurement and Assignment Committee sent a letter of explanation to each member following the meeting. The letter announced that all physicians under the age of 45 should hold themselves in readiness to apply for commissions as the need arises. For the present, however, and until the emergency demands otherwise, only those who are under thirty-seven years

of age, and a few other special cases, will be called upon to apply for commissions.

A letter was to be sent to all of the latter who have been classified as available, informing them of the fact and urging them to apply immediately to the Medical Recruiting Board set up by the Surgeon General of the Army at 496 Lowry Medical Arts Building in Saint Paul.

This Board is now made up of Major C. A. Wood, representing the Surgeon General, Major Baptiste Groebner, representing the Adjutant General, Captain George E. Moore of the Army Air Corps, and Lieutenant Delow W. McCormack of the Dental Corps.

Minnesota is still some 400 short of its quota of approximately 900 physicians required by the Army and the Board will remain in Saint Paul, it is understood, until that quota is filled or other methods are put in force for securing the required number.

No Experiments Here

War with its drain upon finance and manpower leaves little time or popular attention for the experiments in new types of medical service which formerly occupied the foreground of much medical as well as lay discussion.

In Minnesota the Committee on Sickness Insurance of the Minnesota State Medical Association continues its detailed studies of all legal and social aspects of sickness insurance but is not prepared to promote any type of prepayment plan for medical services. Several county societies have considered the matter and have been assured of the interest and assistance of the state committee; but experience in other states has not been such as to prompt precipitate action here.

Aid Offered

The state committee reported on its studies in Duluth, offered its services to interested groups who would like the benefit of figures gathered in its files but made no recommendations for immediate action.

Meanwhile a prepayment plan for Farm Security Administration clients was reported as underway, with Council approval, in two counties—Ottertail and Morrison. No conclusions as to the success of this first undertaking of the sort in Minnesota were made to the Delegates inasmuch as the experiment is not yet one year old.

WARTIME CHANGES

It is probable, in view of wartime pre-occupations, that attempts at out-and-out socialization of medicine by the government is unlikely for some time to come. Changes in the pattern of American medical service are more likely to come about through special programs for special population groups, such as mothers and babies and industrial workers. These programs would be inaugurated by regulation through special wartime powers to care for emergency needs.

Dr. Martha W. Eliot of the Children's Bureau is already advocating extensive new maternity and child health services to be set up on a war-emergency basis and financed on a matching basis out of social security funds.

Health Education in Minnesota

Public Health education continues to be a major function of organized medicine and the need for it becomes more acute as the war advances.

The work of the Minnesota State Medical Association in this field is outstanding, as reports of committees to the House of Delegates in Duluth clearly indicated. Medicine in Minnesota has forged ahead, in coöperation with the State Board of Health, in many fields. Active and continuing programs in nutrition, immunization and tuberculosis control were reported to the delegates, and also in the detection of eye and hearing defects in children and in the early discovery of cancer.

Program Varied

Simple nutrition pamphlets have been put in the hands of physicians for distribution to their patients. Posters and leaflets on immunization and vaccination have been disseminated widely over the state and the Meeker county experiment in county-wide testing of the population for tuberculosis, coupled with the newly inaugurated system for accrediting counties for tuberculosis control in the human population, has attracted nation-wide attention.

In addition to these special undertakings, a weekly radio program, a weekly question and answer service to newspapers, college lectures and the monthly packet service to physicians designed to aid them in public education as well as in their own practice form the groundwork

f systematic authoritative information on health in this state.

Foundations at Work

The growing interest in health everywhere is revealed by the fact that health programs now outrank education as the foremost concern of private foundations. A recent survey showed that 314 leading American foundations now grant a total of \$40,400,000 annually to this branch of social betterment.

The endeavor of the foundations is scattered, however, and it seems obvious that medicine and the medical profession must dominate the thinking and the action in this field; otherwise the public health education of the future may well be guided by men who do not understand essentials of public health.

Meanwhile, health education has become an essential part of the war effort and physicians in Minnesota, as the reports of their work in Duluth amply showed, are well prepared to assume the necessary leadership in this field.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

J. F. Du Bois, M.D., Secretary

De Witt, Iowa, Physician Loses Minnesota License for Felony Conviction

Re: State of Iowa vs. Morton Lyon, M.D.

At the last regular meeting of the Minnesota State Board of Medical Examiners held on July 10, 1942, the Minnesota license to practice medicine held by Morton Lyon, M.D., DeWitt, Iowa, was revoked. Dr. Lyon was convicted on September 9, 1935, in the District Court of Clinton County, Iowa, of a felony, to-wit: An attempt to produce abortion. At that time Dr. Lyon was sentenced to a term of not to exceed 5 years in the Iowa Prison at Fort Madison. He was also fined \$500.00 and costs. The Court suspended the sentence during good behavior, but subsequently, and on April 22, 1940, the Court vacated the suspension and ordered Dr. Lyon committed. Shortly thereafter Dr. Lyon took an appeal to the Supreme Court of Iowa, but the appeal was dismissed on November 20, 1940. On November 14, 1940, Dr. Lyon was granted a parole by the Governor of Iowa, on condition that he surrender his Iowa license to practice medicine and close his office.

According to the records of the Minnesota State Board of Medical Examiners, Dr. Lyon was born in 1866, and graduated from Rush Medical College in 1896. He was licensed to practice medicine in Iowa and Minnesota the same year. Dr. Lyon was licensed to practice medicine in Illinois in 1898 and in South Dakota in 1901.

BIRTHS AND DEATHS IN THE UNITED STATES

While the United States set a new record low for infant and maternal death rates in 1940, the "Vital Statistics Summary: United States, 1940" finds that the general mortality rate increased slightly, from 10.6 per thousand to 10.8. This change was due largely to increase in deaths from heart disease, cancer and diabetes. The birth rate, however, also increased from 17.3 per thousand of population in 1939 to 17.9 in 1940, which is the highest recorded from the birth registration area since its completion in 1933. Possibly this indicates a cyclic change closing a long period of a declining birth rate.

This increase in birth rate has been accompanied by a reduction of the infant mortality rate to 47.0 per thousand live births in 1940, which was the lowest ever recorded for the birth registration area. However, the provisional infant death rate for 1941 is 46.2, which would seem to predict a further decline. In 1915 the infant death rate was approximately 100, so that the last twenty-five years has seen a decline of about one half. It is estimated that this amounts to the saving of the lives of 973,626 infants that would otherwise have been among the 3,264,365 infants that died during the past twenty-six years. This reduction in infant mortality has taken place in both the white and Negro races, although the rate for Negroes is still considerably higher than that for the white race. The rate of decline of infant mortality has been slightly greater for the Negroes than for the white race.

The lack of medical care in rural districts, of which so much has been said and written, did not raise the death rate on the farms to the level of the city population. The rural rate in 1940 was 9.8 per thousand of population, while in the cities of more than a hundred thousand residents it was 11.3. The highest rate (12.4) was in cities of between 2,500 and 10,000 population. Males have a decidedly higher death rate than females: 12.0 to 9.5 per thousand of population, respectively. There is an even wider difference between the white and other races, the white being 10.4 and "other races" 13.8.

A comparison of the crude death rates for thirty-three specified countries, of which the latest information is for the year 1937, shows that of nations with a dominant white population Chile has the highest death rate. Yet Chile is the only nation on the western hemisphere that has an extensive system of sickness insurance. The only nations that have a lower death rate than the United States are Denmark, Uruguay, Norway, New Zealand, Australia, Canada, Union of South Africa and the Netherlands. Denmark is the only one of these countries that has a nationwide system of compulsory sickness insurance.

There is eighty times as much tuberculosis found in discharged sanatorium patients as in the unselected population, it is estimated, and thirty times more tuberculosis in the contact group than the general population.—L. M. MORSE, M.D., *Wis. Med. Jour.*, Mar., 1941.

To attend school, the young man or woman must be properly clothed. If his clothing becomes soiled or torn it should be cleaned and mended but the tailor's work, though valuable, is no part of education. Likewise, to profit in school training youth should be clothed in health. If health is impaired it must be repaired. But the medical sponging and patching are neither education nor hygiene, though the methods used in such repair may be, and are, increasingly educational.—Ed. *News Letter*, Loyola Univ., Jan., 1942.

INDUSTRIAL HEALTH

WORKER HEALTH MEASURES IN TWENTY-FIVE STATES

Minnesota is one of twenty-five states in which there are actively functioning industrial health units. The states are well distributed geographically over the country and they include in their jurisdictions a labor force of approximately twenty-nine and one-half million workers, more than half of that for the whole country.

A total of 215 persons were recently discovered by the United States Public Health Service to be carrying on the activities of these departments, including physicians, engineers, sanitarians, a few nurses and clerks, with a total expenditure of slightly more than one-half million dollars.

Functioning thus, with a bare nucleus of personnel and inadequate budgets, the health service nevertheless found that these divisions were carrying on an effective and widely diversified program.

Study Launched in Minnesota

The following recommendations made on the basis of a study of the work of these divisions is particularly interesting to Minnesota physicians in as much as Minnesota's Division of Industrial Health is already well launched upon the investigation of occupational disease in Minnesota which the health service found largely lacking in most parts of the country.

"Several pertinent facts were brought out by this analysis," says the report. Of the twenty-nine and one-half million workers in these twenty-five states, about one-half of whom are engaged in industries with potential health hazards, less than two million were reached through industrial hygiene services during the period of a year. With the present personnel and budgets, this represents the peak load these divisions can apparently carry. The analysis further points out that probably one-half of the employees are working under conditions that need some correction or improvement. Instead of these conditions

improving they may be growing worse as the result of increased industrial production. Individual company reports have revealed, for example, that new health problems, totally unrelated to normal times, have been created and are causing bottlenecks in productions: that days lost from sickness and accidents have increased and that many instances of occupational diseases have developed as a result of use of toxic materials, because the supply of relatively safe substances is being diverted for production of war materials or cannot be replaced.

"These conditions clearly indicate the need for more follow-up work in those plants where recommendations for improvements have been offered. More effort in this direction will mean more compliances. Experience has shown that industry is more likely to coöperate if convinced of the need for such improvements and assured of the interest and determination on the part of the government agency responsible to see that they are carried out.

Less Than Four Per Cent

"Another shortcoming in the industrial hygiene programs is investigation of occupational diseases. The results of the analysis revealed that less than four per cent of the investigations were made for this reason. The divisions can do much not only in stimulating such investigations but also in sponsoring and inaugurating the uniform reporting of occupational disease.

"In addition there is the problem of absenteeism reporting from all disabilities, an activity that is still unexplored. Industry is not fully aware of the importance of such statistics in determining the nature and extent of its health problems. In concentrating on the vital necessity of speeding up production, it is likely to overlook the somewhat obscure factor of lost time from sickness as a cause of impeded production. The divisions can sponsor and stimulate absenteeism reporting by persuading industry to adopt systems of keeping the necessary records."

TRANSACTIONS of the MINNEAPOLIS SURGICAL SOCIETY

Stated Meeting, Thursday, March 5, 1942

President ARTHUR BRATRUD, M.D., in the Chair
Secretary R. F. McGANDY, M.D.

TRAUMATIC DISORDERS OF THE PERIPHERAL VASCULAR SYSTEM

U. SCHUYLER ANDERSON, M.D.
Minneapolis, Minnesota

Since loss of blood is one of the most serious consequences of all injuries, wounds of blood vessels have always held the interest of surgeons. Although the treatment of open wounds of blood vessels is the everyday practice of all surgeons, closed vascular traumas and functional disturbances which are traumatic in origin receive relatively less attention. The study of traumatic disorders of the peripheral vascular system becomes of great interest today because the occurrence of these injuries is greatly increased during war. Matas²² estimated that in World War I 20-25 per cent of the wounded reaching the surgeon at the first post of relief had major blood vessel injuries. In World War II, the civilian surgeon may be as much concerned about this subject as the military surgeon because of the aerial bombardment of cities and apparent non-military objectives. It is the present opinion that the surgeon is now better able to treat these injuries because he has at his command heparin, sulfonamides, blood banks and human blood plasma. A more hopeful attitude toward reparative vascular surgery is afforded by the use of heparin as demonstrated by Murray.²⁷ Since sulfonamide chemotherapy is of proved value in decreasing the incidence of infection in any wound, it will no doubt prove effectual in treating open wounds of blood vessels. A consideration of prime importance in maintaining the viability of an extremity following major blood vessel injury is the prevention and treatment of shock. The greater availability of blood for transfusion and human blood plasma for intravenous infusion will contribute greatly to a successful issue.

Traumatic disorders of the peripheral blood vessels may be classified as shown in Chart I.

An intimate knowledge of the anatomy and physiology of the peripheral vascular system is required for the intelligent treatment of injuries to blood vessels. Acquaintance with the fact that one may safely ligate the splenic artery proximal to the anastomotic blood vessels in the gastro-splenic ligament, or that one may not safely ligate the femoral artery in Scarpa's triangle to control bleeding from an open wound of this artery in the femoral canal is as important as knowing that intima must be approximated to intima to obtain successful anastomosis of blood vessels. Dependence on collateral circulation without realization of the effect of trauma on the vasoconstricting sympathetic nerve fibers supplying this circulation may lead to failure. Traumatic irritability of the arterial wall and of the

sympathetic nerve ending may cause such severe vasospasm that arterial flow becomes entirely inadequate.

The etiology of these wounds may range in character from minor almost unexplainable, trivial traumas to severely damaging forces. Contusion or bruising of blood vessels most often follows direct trauma, such as blows or crushing injuries. Both contusion and lacerations are associated so frequently with fractures that careful examination to determine their presence or absence becomes mandatory in every fracture case. The blood vessels may be contused by the bone fragments, stretched by displacement, or penetrated by splinters of bone. Dodd⁸ has shown that blood vessels are injured most frequently when the fracture occurs at a site where the blood vessel is relatively immobile so that it cannot escape contusion. Vascular injuries are more common in the lower extremity due to the proximity of the blood vessels to bone and their fixation in fascia and aponeurosis such as the inguinal ligament and adductor canal. The ease with which the brachial artery may be injured in supracondylar fractures of the humerus is well known. Femoral thrombosis may follow fracture of the neck of the femur, as noted by Watson-

Jones.²² Heat may cause thrombosis of peripheral vessels but cold produces more commonly an effect on these structures. Freezing may cause the functional disturbance of chilblains or the organic catastrophe of gangrene from thrombosis of the blood vessels.

Thrombophlebitis of veins following intravenous infusions of sodium chloride or glucose is not at all rare. Thrombosis of the axillary vein has been ascribed to effort by many contributors to literature. A number of cases have been reported by Gould,¹¹ Barker³ and Matas.²³ Kaplan and Katz¹⁶ considered this condition a definite clinical entity but felt that the etiology has not been proved. Indirect trauma, in their opinion, however, plays a leading role. Homans¹⁴ stated that a slight strain of the calf muscles may cause thrombosis of the deep or perforating veins. He believes that this frequently unrecognized thrombosis is the source of pulmonary emboli in many instances. Sprains of the ankle have been reported by Vance³¹ and Martland²¹ as the only attributable etiology of thrombosis of the deep veins of the leg in which pulmonary embolism and death occurred.

McCartney,²⁴ in a paper on pulmonary embolism, drew certain general conclusions. Those which are pertinent to this discussion are as follows:

1. Post-traumatic thrombosis and embolism are rather common.
2. The source of the embolism is usually at the site of the injury.
3. Prolonged immobilization and rest in bed necessary for repair of fractures of the long bones of the lower extremities promote stasis and the possibility of a resulting thrombosis.
4. Fracture of the femur is the most common cause of post-traumatic pulmonary embolism.

Twenty-eight cases or 3 per cent of 1,011 cases of thrombophlebitis reviewed by Barker² were traumatic in origin. These were caused by tearing, crushing fractures, tight casts and bandages. Injury of the axillary vein from pressure of crutches or following dislocation of the head of the humerus is fairly common.

Perforation or puncture of both arteries and veins are produced by bone fragments, shotgun pellets, small calibre gun missiles and sharp-pointed weapons of small diameter. Laceration and complete division are caused by knives, gunshot discharges at close range, bomb and shell fragments, shrapnel and sharp fragments of bone.

The continuous use of rapidly vibrating tools such as the pneumatic hammer or stone cutters' chisel results in increased irritability of the arterial wall and sympathetic nerve ending to such a degree that vasoconstriction ensues. The affection may become sufficiently advanced to produce necrosis of the finger tips.

Peripheral arterial disease, whether due to trauma or other causes, may be organic or functional. Organic and functional disturbances may be present at the same time in the same artery. Organic disorders include all diseases arising from pathological alterations in the

wall of the vessels, in the lumen, and extra-arterial lesions which compress the arteries. Functional cases include all those diseases in which circulatory disturbances arise from abnormal influences upon the vaso-motor system. The organic disturbances consist of inflammatory diseases, degenerative diseases and those producing mechanical obstruction. Degenerative diseases are of interest in this discussion since knowledge of their existence prior to trauma is important in prognosis as well as treatment. Although various grades of inflammation of arteries may follow injury, it is in the production of mechanical obstruction that trauma plays the greater part. Thrombosis, embolism, external pressure by bone fragments or hematoma and ligation are the factors which produce obstruction. Hemorrhage is the result of open vascular wounds but to be controlled must be influenced by one of these factors unless successful anastomosis or suture has been accomplished.

Trauma usually produces a vasoconstriction where the vasomotor system is involved. Acute segmentary vasospasms in which there has been no actual injury to the blood vessel have been reported by Montgomery and Ireland²⁶ and Kroh.¹⁷ A bullet may enter an extremity and lodge near the major artery producing only slight extravasation of blood by no means sufficient to produce pressure on the artery. A spasm of the artery and its collaterals follows and produces occlusion of these vessels. The extremity becomes pale, cold, lifeless and pulseless. Lewis²⁰ called the condition "local arterial spasm associated with impact." Acute vasospasms which may become chronic leading to atrophy and causalgia-like conditions may follow many forms of trauma. According to Leriche^{18,19} an obliterated artery ceases to be an artery and becomes a diseased plexus of sympathetic nerve fibers provoking distal vasospasm in the anastomotic network of blood vessels. Homans¹⁶ believes a vicious reflex may follow vascular injury to such a degree that changes in skin, nerves, muscles and joints, with dystrophy and osteoporosis may occur. Pneumatic hammer disease,¹² miners' hands, and stone cutters' disease are functional vasomotor disturbances of occupation.

According to Bailey,¹ the sequelæ of localized contusion to an artery are thrombosis, embolus, secondary hemorrhage following arteritis with a weakened wall and aneurysm.

Hemorrhage from puncture of perforating wounds frequently subsides spontaneously whether or not there exists a communication to the outside through a break in the skin. Contraction of the opening in the artery by constriction of the vessel itself takes place, a blood clot plugs the opening, and thrombosis follows. If no communication with the outside exists, a hematoma may form and bleeding is stopped by extrinsic pressure on the artery. If the hematoma is large the pressure may be great enough to occlude the artery and its collateral and thus produce gangrene distal to the hematoma. The hematoma may later develop into a false aneurysm.

From complete division of an artery, massive hemorrhage is frequent. However, spontaneous cessation of bleeding may ensue, especially when the edges of the

divided vessel are rough and uneven, by contraction of the vessel and the production of a tack-like clot. If there is no external communication, bleeding may be stopped by the hematoma which invariably forms after complete division of an artery. When external communication through a break in the skin and the tissues surrounding a divided artery exists, hemorrhage is usually great and loss of life frequent. The size of the external wound is a factor in spontaneous stoppage of bleeding. Occasionally extensively damaged tissue and muscle may close the opening in the vessel, at least temporarily.

The end results of trauma to peripheral veins are obstructive or non-obstructive in character. Thrombosis may follow both open and closed wounds. Inflammation commonly is associated with the thrombosis. The obstruction to venous return may be intrinsic and be caused by pressure of a hematoma or bone fragments. Non-obstructive lesions are arteriovenous fistulae and rupture. The former is caused most often by a penetrating wound of an artery and its concomitant vein. Rupture, as in arterial trauma, occurs in the weakened or infected contused wall of the injured vein.

The immediate results of trauma causing open wounds of veins are hemorrhage and air embolism. Hemorrhage from a vein is usually less serious than that from an artery, spontaneous cessation of bleeding occurring frequently. However, in certain anatomic positions serious venous hemorrhage is often more embarrassing than arterial bleeding. Such situations are the splenic pedicle, renal pedicle, root of the neck, near the jugular bulb and deep in the pelvis. Air embolism is more serious and not infrequently fatal. The most dangerous areas in which fatal air embolism may follow vein injury are the sites just above and below the clavicles.

The immediate formation of a swelling or tumor which may increase in size or pulsate is indicative of hematoma. All suspected wounds of blood vessels should be carefully examined for extravasation of blood in the adjacent soft tissues. Massive infiltration of blood may first produce venous obstruction, followed by arterial occlusion, lymph stasis and finally gangrene. Shock may obscure and make the signs of occlusion of the blood vessels difficult to elicit. The area should be auscultated to determine the presence of a bruit. Collapse or distension of the superficial veins occurs.

Early subjective symptoms of arterial occlusion are numbness, tingling, pain, paresthesia and anesthesia. Early objective findings may be pallor, cyanosis, absent normal pulsations and paralysis. Gangrene may occur early or late. Later effects of arterial obstruction are atrophy of the muscles, contracture, ischemic neuritis, osteoporosis, trophic edema, trophic ulcers and skin changes.

Leriche¹⁸ has classified the disturbances which may follow ligation of the main artery to an extremity as follows:

1. A mechanical syndrome grading from massive gangrene down to localized necrosis in muscles, causing orthopedic troubles later.

2. Functional disorders such as intermittent claudication.

3. Vasomotor disorders with cyanosis, trophic troubles and muscular paresis.

Signs of venous obstruction are swelling of the extremity, edema and cyanosis. If the obstruction is due to thrombosis in the vein, the thrombus may be palpable. When phlebitis is associated, tenderness may be elicited. The superficial veins may be collapsed or dilated. Pain is often a prominent symptom of thrombophlebitis. There is usually increased temperature of the extremity. Late manifestations are brawny induration, pigmentation of the skin, ulceration and persistent stasis edema.

Since the usual functional disturbance following trauma to arteries is vasoconstriction, the symptoms and signs of this condition are those of occlusion. Acute traumatic segmentary vasospasm of the femoral artery will produce a cold, lifeless and pulseless extremity which may become gangrenous. In pneumatic hammer disease, circulatory arrest is initiated usually by cold weather. The fifth and fourth digits of the left hand are most frequently involved. Actual necrosis of the fingertips may be caused by the long continued vasospasm.

Michiner²⁵ stated that the failure to recognize early injury to blood vessels may result in the gradual appearance of some kind of traumatic aneurysm. Symptoms of this condition are fullness and tiredness of the extremity with pain and edema distally. A bruit and thrill may be present. Pulsations distally in the veins occur. A persistent tachycardia not explained by fever or infection should cause one to look for the presence of an aneurysm.

Immediate control of hemorrhage following open vascular wounds is a consideration of first importance, often as a life-saving measure. There is no doubt that the application of the tourniquet has saved many lives, but it is also true that the tourniquet has contributed to or has been the cause of the loss of many limbs. This means of controlling hemorrhage should not be used indiscriminately but only when large arteries are lacerated or traumatic amputation of an extremity has occurred. Bailey¹ gave the indications for the employment of the tourniquet as: (1) primary arterial hemorrhage which cannot be controlled by a firm pad and bandage or digital pressure; (2) reactionary and secondary hemorrhage; and (3) to render an operative field bloodless. When it can be used, the blood pressure cuff is the best tourniquet, since pressure is applied to a wide surface and may be adjusted easily. Venous bleeding can nearly always be controlled by a firm pad with bandage and elevation of the extremity. In using a tourniquet, one must avoid excessive as well as inadequate pressure, imperfect fixation, prolonged fixation, undue manipulation and injury to the skin. Where there is an open wound of a blood vessel with communication with the outside and ligation or repair cannot immediately be done, the application of artery forceps would seem more desirable than prolonged use of a tourniquet.

If there is no frank external hemorrhage from an

open wound, treatment of arterial injury must be directed toward the correction of one or more of the following conditions: thrombosis, hematoma and vasoconstriction. Thrombosis of an artery following contusion should nearly always be treated conservatively by attempting to increase the collateral circulation. If these methods fail, arteriectomy as advocated by Leriche¹⁰ may be contemplated. In most instances it is not feasible to remove the thrombus since recurrence invariably follows. Where heparin can be used, this may not be true. When it does seem desirable to remove the thrombus, the incision in the artery should be made above the site of the thrombus. The clot may then be removed by forceps or suction.

Whether or not a hematoma should be treated conservatively often requires keen judgment. Surgical intervention is indicated, according to Bigger,⁵ if: (1) continued or recurrent bleeding as indicated by increase in size of the hematoma occurs; (2) inadequate distal circulation persists in spite of attempts to obtain vasodilatation of the collateral circulation; and (3) large amounts of devitalized tissue are present. Pulsating hematomas may, however, heal spontaneously. If operation is necessary, a generous and adequate exposure should be made followed by evacuation of the hematoma and ligation of the artery just above and below the site of injury.

Since vasoconstriction may accompany any trauma of blood vessels, much should be done to overcome this physiologic and pathologic state whether surgery is necessary or not. The first step in this direction is the employment of appropriate methods to overcome shock. To prevent loss of an extremity from vascular injury, the blood pressure must be maintained above shock levels. The patient should be kept warm, but too much heat to the involved extremity is contraindicated when arterial trauma is present. The limb should not be exposed to temperature greater than 90 degrees Fahrenheit, according to DeTakats.⁶ Heat may speed up local tissue metabolism to the point where the damaged vessels cannot adequately supply the increased demands for fuel, and gangrene results. Freeman⁹ concluded that the extremity could be exposed to a temperature between 86 degrees and 93.2 degrees Fahrenheit without production of harmful effects. The extremity above the site of the injury as well as the body may be exposed to higher temperatures. Hot packs may be applied to the abdomen and upper thigh in injury of the popliteal artery, for example.

The limb should be placed in a dependent position, usually 10-15 degrees below the horizontal level. The position should be such that the tips of the toes or fingers retain their normal color. The use of tobacco should not be permitted. Vasodilating drugs, such as papaverin, sodium nitrite and nicotinic acid may be given. Alcoholic beverages may be helpful. The use of as much opiates as necessary to control pain is desirable. Local infiltration at the fracture site to overcome pain in those cases of blood vessel injury associated with fracture is desirable. This procedure has been employed at the Minneapolis General Hospital*

and has been found beneficial in preventing and overcoming shock accompanying fractures. Paravertebral sympathetic nerve block, spinal anesthesia and local infiltration around the injured artery with procaine often overcome vasospasm by temporary paralysis of the sympathetic nerves supplying the arteries. Various types of negative and positive pressure producing apparatus may be used and intermittent venous hyperemia or occlusion may be employed. Where the vasospasm becomes chronic, various operative procedures on the sympathetic nerves have been advocated, such as sympathetic ramisection, paravertebral ganglionectomy, periarterial sympathectomy and arteriectomy. Periarterial sympathectomy and arteriectomy do not seem entirely rational and are performed by few neurosurgeons. Preganglionic ramisection is considered by many neurosurgeons the procedure of choice because the denervated smooth muscle is less sensitive to adrenalin. There is some question about the justifiability of using any of these operative procedures since their effects are not permanent in every instance.

Acute traumatic segmentary vasospasm is seldom diagnosed without exposure of the involved artery. The exposure and application of warm saline packs usually produces vasodilatation of the constricted portion of the artery. Pneumatic hammer disease disappears on change of occupation unless the condition has become chronic. In treating frostbite one should keep in mind that vasoconstriction is a prominent phenomenon. Employment of the methods outlined above to produce vasodilatation may be beneficial. In addition to these methods, Bertocchi⁴ reported at a symposium on injuries caused by congelation the value of short wave diathermy in treating frostbite.

While there is considerable argument concerning the relative merits of ligature and suture, there are certain principles in the treatment of open vascular wounds which are accepted by most surgeons. An open wound of a vessel which is visible should always be ligated or repaired whether or not there is bleeding. However, one should not interfere primarily with an injured large vessel not visible in the wound when bleeding seems controlled and viability of the extremity distally is not endangered. It is better to permit the formation of a hematoma and a false traumatic aneurysm. These conditions can more safely be treated at a later date.

When there is absolutely no chance to preserve an extremity or its functional value, amputation should be done immediately. Following severe injury to an extremity, this procedure is often necessary to save life. When restoration of the limb can be expected following major blood vessel injury, ligation or suture should be practiced. Considerable difference of opinion is present among surgeons as to the advisability of suture during warfare. Mitchiner²⁵ considered suture not justifiable in the majority of cases since it requires a long operation, too frequently results in thrombosis at the suture line and arterial or arteriovenous aneurysms too often develop. Bigger⁵ believed that vascular suture was not feasible in World War I since contamination was great and there was profound shock present in most instances. In his opinion the procedure was time-consuming, the danger of secondary infection was

*Fracture Service, Minneapolis General Hospital, A. A. Zierold, Chief.

great and, in many cases, there was too much damage to the vessel wall. In World War I, most American, British and French surgeons were of the opinion of Bigger and Mitchiner. German surgeons, however, according to Matas,²² attempted suture frequently. In the present war, Wenzl²³ has answered the question of whether the present World War has definitely decided in favor of the necessity of the suture of blood vessels in the affirmative. He compares the advantages of suture and ligation of the blood vessels. Gangrene will occur in a certain percentage of cases in which the vessels have been ligated. DeTakats⁷ gave the following figures for development of gangrene after ligation at the following sites: the subclavian artery in 9.7 per cent of the cases; the axillary artery, 9.8 per cent; the brachial artery, 3.1 per cent; the common iliac, 100 per cent; the external iliac, 13.4 per cent; the femoral artery above the profunda branch, 21.8 per cent; the femoral artery below the profunda branch, 10.4 per cent; and the popliteal artery, 37.2 per cent. Wenzl²³ found at the dressing stations and field hospitals that gangrene always developed following ligation of the popliteal artery. In those instances in which the extremity escapes gangrene, the functional disturbances following ligation may be so great as to produce a painful, useless extremity. Murray,²⁷ in using heparin after vascular suture, had 80 per cent of the blood vessels remain patent. When venous transplants were used, 70 per cent remained patent. The use of sulfonamides locally may reduce the incidence of infection and thereby decrease the danger of secondary hemorrhage. According to German authors, suture reduces mortality as well as the incidence of gangrene and functional incapacity. Nevertheless, it would seem that arterial suture should be employed only under the most favorable circumstances, in clean wounds and by those skilled in its technique. Preferably ligation should be performed in most instances and measures taken to establish and maintain an efficient collateral circulation.

When ligation is elected as the procedure of choice in treatment of an open wound of an artery, it is suggested that the following points be observed:

1. The ligatures should be placed close to the site of injury, otherwise there is danger of hemorrhage from branches of the artery.
2. The injured portion of the artery should be excised.
3. Non-absorbable material should be used for ligation in most instances.
4. At least three ligatures should be used, two proximally and one distally.
5. The concomitant veins should be separately ligated as first suggested by Makins in 1917. Holman and Edwards,²⁹ on the basis of experimental evidence, found ligation of the vein proximal to the site of arterial injury produced better results than the ligation of the vein at the same level as the artery. Venous pressure is increased by this procedure and as a result collateral circulation is stimulated.
6. Following ligation, every effort should be made to increase collateral circulation.

Reid³⁰ has made excellent suggestions in the technique of ligation. He advised: (a) when ligating arteries, less damage will be done to the arterial wall if the vessel is temporarily occluded proximally and distally during the procedure of pulling the ligature tight, (b) the size of the ligature should vary directly with the size of the artery, (c) one ligature on a large artery should be anchored, (d) one should not cover or bury ligatures of arteries in an infected or potentially infected wound, and (e) no catgut should be used.

In lieu of ligation or suture, Bailey¹ has suggested the use of a glass canula with general heparinization as a temporary expedient in dealing with wounds of large blood vessels. This is a revival of the principal of the Tuffier tube which was a paraffin-coated silver tube which ideally maintained blood flow until adequate collateral circulation developed.

Secondary hemorrhage may follow any blood vessel injury when infection supervenes, usually ten to sixteen days after injury. Shock is severe and entirely out of proportion to the amount of blood lost. As emergency measures, bleeding may be controlled by tourniquet, pressure or packing. Shock should be treated immediately. Later the bleeding vessel may be ligated close to the source of bleeding. Proximal ligation is considered futile. The infected clot is removed and the vessel ligated with silk or tape, the ends of which are brought out of the wound. Where bleeding is not serious, packing may suffice. Whether packing or ligation is used, the extremity should be immobilized. The packing may cautiously be removed at the end of forty-eight hours, while the sutures are left in place for two weeks or more.

When a traumatic aneurysm has developed, sufficient time should be allowed to elapse for the establishment of adequate collateral circulation, usually three to six months. Essential treatment of traumatic false arterial aneurysm is proximal and distal ligation of the sac, while that of arteriovenous aneurysm is quadrant ligation. In rare instances, establishment of circulation may be attempted.

The treatment of closed venous injury is mainly that of phlebothrombosis or thrombophlebitis. Prophylactically prolonged immobilization should be avoided wherever possible following trauma. DeTakats⁸ considers rest necessary for only a short period in cases of thrombosis of the superficial veins, since rest may favor or produce thrombosis of the deep veins. When it appears that the thrombosis is ascending, ligation of the saphenous vein at the sapheno-femoral junction is advised.

When the deep or perforating veins are involved, strict bed rest is necessary until temperature and pulse are normal. Heat should be applied and the leg elevated. The vein may be ligated above the site of the thrombus to prevent embolism. Paravertebral sympathetic nerve block with procaine, popularized by Ochsner and DeBailey,²⁹ especially when done repeatedly may bring symptomatic relief as well as hasten subsidence of inflammation and edema. Heparinization will prevent, according to those who have used it in a large number of cases, spread of the thrombosis. Occa-

sionally actual suppurative of an acute post-traumatic thrombophlebitis may take place with the formation of abscesses. These abscesses must be drained as they occur. Chemotherapy of phlebitis may do much to prevent this condition.

Bleeding from open wounds of veins may be controlled by: (1) pressure; (2) by leaving applied artery forceps in place for forty-eight hours; (3) by packing, although the contiguous artery may be damaged by this procedure; (4) by fine ligature; and (5) suture. When air embolism occurs, the circulation is embarrassed by air in the right auricle and in the small blood vessels of the lungs. Measures which have been suggested to overcome these conditions are aspiration of the right auricle, cardiac massage, catheterization and removal of air through the jugular vein and persistent artificial respiration.

Summary

1. A classification of traumatic disorders of the peripheral vascular system has been attempted.
2. A review of the etiology, physiology and pathology has been presented.
3. Suggestions for treatment of these disorders, stressing particularly the importance of overcoming vasoconstriction, have been made.

THROMBOSIS OF THE AXILLARY VEIN

HENRY E. HOFFERT, M.D., F.A.C.S.

Minneapolis, Minnesota

Primary thrombosis of the axillary vein is a rather rare condition but is nevertheless a definite clinical entity. Veal found less than 150 cases reported in the literature up to 1940 and while this is probably not an indication of the incidence of this condition, the fact that only twenty-three authors reported more than one case up to that time appears to be significant.

A consideration of thrombosis in this location, as in others, on an etiological basis shows that four factors operate in the causation of this lesion.

1. Infection or other disease of the vein wall.
2. Trauma.
3. Venous stasis.
4. Altered state of the blood.

Acute thrombosis of the axillary vein produces a typical symptom complex, regardless of the etiology of the thrombosis. The more common signs and symptoms follow.

1. *Pain in arm and shoulder.*—This may be slight but usually is moderately or extremely severe. It is often described as a sense of soreness, or as a stinging or sticking sensation. Associated with local pain is tenderness which in general extends along the course of the involved vein.

2. *Edema.*—There is usually some redness and local swelling over the involved segment of the vein, often described as a lump, or better, a cordlike mass but in addition to this there is usually a generalized edema

of the extremity due to congestion of the entire venous and capillary bed distal to the site of blockage. The size to which this swelling develops is dependent upon the degree of involvement of the vein as well as the rate of establishment of collateral circulation.

3. *Weakness and partial loss of function of the arm.*—This is dependent upon the extent, duration and acuteness of the involvement, it being more severe as edema occurs and increases.

4. *Preservation of the radial pulse.*

5. *Elevation of systolic pressure on the affected side.*

6. *Fever may or may not be present.*

7. *Tachycardia* is a frequent sign even in the absence of fever. If persistent, it is considered evidence of continued activity of the disease.

The essential pathology of thrombosis of the axillary vein is that of obstruction of the return flow of blood from the hand and arm, vasospasm, an increase of local venous pressure and an escape of fluid into tissue. As a rule the process is not confined to the axillary vein alone but involves to some extent the subclavian, the basilic and brachial veins, occasionally the external jugular and rarely the internal jugular vein. The entire thrombus may be absorbed or it may become organized and permanently obstruct the vessels. Recanalization of the lumen may occur but this is usually incomplete and the return circulation must be carried on by the newly developed collaterals.

Veal⁵ has classified thrombosis of the axillary vein as follows:

1. Primary thrombosis.
 - (a) Thrombophlebitis, bacterial invasion.
 - (b) Phlebothrombosis, aseptic traumatic, or effort thrombosis.
2. Secondary thrombosis.
 - (a) Thrombophlebitis from regional infection.
 - (b) Thrombosis from malignancies of the axilla and chest.
- (3) Post-thrombotic syndrome.

True thrombophlebitis of the axillary vein is an exceedingly rare condition when compared with the frequency of its occurrence in the vessels of the lower extremity. There are probably two reasons for this variation. The most important is the rapid emptying of the venous system of the arm by almost continuous use of the limb and, secondly, because of the shortness of the course through which the blood must flow, stasis being unusual. This condition presents definite constitutional and local signs, namely elevation of temperature, acceleration of pulse and leukocytosis. It occurs most often in cardiac patients in whom there is slowing of venous blood flow. Phlebitis may be secondary to some regional infection or from malignancies of the axilla or chest.

In a study of approximately sixty cases of post-operative edema of the arm, following radical mastectomy for carcinoma of the breast, Veal⁶ found that the cause of the edema was an obstruction of the venous return from the arm in about 90 per cent of the cases. The obstruction in some was the result of scar formation, in others direct involvement of the

axillary or subclavian vein by the carcinoma. In an effort to reduce the incidence of obstruction of the vein due to scar formation it has been our custom to preserve a small portion of the pectoralis major and minor which is sutured in place over the vein. There is less possibility for the development of adequate collateral circulation after radical mastectomy because, due to the nature of the operation, the acromi thoracic, often the long thoracic and sometimes the cephalic vein has been sacrificed.

Phlebothrombosis (aseptic traumatic or effort thrombosis). This group is made up of sterile or non-bacterial thrombosis and includes the so-called "effort" thrombosis. This condition occurs in healthy individuals; males predominate in a ratio of 4 to 1 and the right arm is involved in a proportion of 25 to 1. The onset is usually quite acute but may be gradual. Pain is the first symptom, and swelling of the hand and arm develops rapidly. There is an associated arterial spasm which may cause the hands to feel cold and numb and produce a slight cyanosis of the fingertips. The arterial pulse can be easily palpated. Along the inner surface of the upper arm a firm, tender, cordlike mass can be felt extending up through the axilla and to the chest wall. Usually this cord involves the basilic, the brachials and the axillary, and sometimes the jugular veins. The maximum swelling usually occurs in twenty-four hours after onset and persists from a few days to a month or longer. As the edema subsides there is evidence of superficial venous collaterals developing over the upper arm, shoulder and anterior portion of the chest wall.

The explanation of the occurrence of a thrombosis following a direct crushing injury to the axillary vein is obvious. However, only a few of the cases reported have followed such an accident. Rowing a boat, tests of strength, baseball, lifting, as well as many other activities, some of which are actually trivial, have preceded the formation of a thrombosis. In some instances this condition has occurred during a patient's sleep without history of injury or trauma.

Veal,⁷ following a series of experimental studies on cadavers as well as on living subjects by means of venograms and axillary venous pressure readings during forced respirations, concluded that (1) the axillary vein was markedly compressed over the subscapularis muscle and beneath the head of the humerus with the arm in a position of abduction; with an actual stretching of the axillary vein proximal to the point of compression, and (2) that respiratory effort might cause considerable distention of the axillary vein particularly if there was any interference with back flow through connecting vessels. He feels that injury to the vein wall may readily occur during compression, stretching or distention, or a combination of two or three factors.

Injury to a vessel, whether it is traumatic, inflammatory or thermal may cause a spasm or contracture of that vessel. Venospasm may result from sympathetic irritation. During the period of spasm the lumen of the vessel may be almost occluded and cause a marked retardation of blood flow.

Whatever the mechanism, it is essential that there is some damage to the vessel wall, and then a slowing down of blood flow for the production of a thrombus. The injury may be to the intima, the valves or the entire vein wall may be damaged.

Although the acute stages of thrombosis rapidly subside, the altered physiology of the circulation may not be corrected. There may remain sufficient obstruction to the venous return to produce more or less permanent symptoms. The severity of these symptoms depends upon the degree of the formation of collateral circulation. Regardless of the type, this follows a more or less definite course depending chiefly upon the extent of the thrombosis. When it does not extend beyond the axillary vein the development of collaterals is rapid but when the thrombosis is more widespread it occurs more slowly. The important tributaries taking part in this process are the superficial veins over the anterior shoulder and chest, the veins following the acromiothoracic artery, the long thoracic and the cephalic vein. As the acute process subsides, there appear newly developed collaterals over the shoulder and upper arm and the edema disappears. There are no further symptoms while the arm is at rest but following exercise or prolonged use of the involved limb, the patient may feel a sense of fullness, weakness, fatigue or actual pain in the arm and shoulder. In some cases there may be a recurrence of the edema following prolonged exercise. The duration of this post-thrombotic syndrome is variable and at times may even be permanent.

Matas¹ has emphasized the importance of these residual symptoms and has called attention to the possible medico-legal aspects that may confront one in the management of such cases.

Treatment.—The conservative treatment of thrombosis of the axillary vein consists of (1) rest in bed, preferably in a hospital; (2) immobilization and elevation of the extremity and the application of either ice bags or large hot packs with the latter definitely favored by most writers. Rest and immobilization should be continued until there is definite evidence of collateral formation. Sulfonamide therapy has been used but in the absence of infection is hardly indicated and the results are variable.

The use of the technique of sympathetic ganglion block with procaine hydrochloride as a conservative form of therapy has been advocated by Ochsner and DeBakey. It is based on the fact that vasospasm is frequently one of the most important factors in phlebitis from the viewpoint of production of pain and disturbance by affecting nearby veins and arteries. The object of this procedure is the reestablishment of the normal exchange of intravascular and perivascular fluids and a breaking up of a vicious circle.

The technique for this procedure is to inject the stellate ganglion by the anterior approach as recommended by Ochsner^{4,5} as follows, I quote, "A point 1 cm. medial to the midpoint of the clavicle is chosen and an intracutaneous wheal of novocain is made in the skin immediately over the upper border of the clav-

icle. A fine lumbar puncture needle is introduced on a horizontal level with the clavicle and directed posteriorly and medially at a 45-degree angle with the midline. The point of the needle, after being introduced for a distance of 6 to 7 cm., impinges against the anterolateral surface of the body of the seventh cervical vertebra or at the junction between seventh cervical and first thoracic vertebrae, where the stellate ganglion lies. After ascertaining by aspiration, that the needle is not in a vessel, 10 c.c. of 1 per cent novocain is introduced. A satisfactory injection is determined by the presence of Horner's syndrome, anhydrosis, and increase in warmth of the extremity on the injected side." End of quotation.

There are no known surgical measures which will completely relieve thrombosis of the axillary vein. Surgical exploration has been undertaken in a few cases but the end results do not justify further attempts. In certain cases in which thrombosis is extensive and in which there is an extreme degree of edema, multiple skin punctures may prove helpful. This procedure must be done under strictly aseptic conditions.

Case Reports

Case 1.—W. L., a single male student, aged twenty-one; was admitted to the hospital on April 24, 1937.

He gave a history of two unusual physical exertions involving the right arm, baseball and a test of strength with another boy. Two days later the arm, forearm and hand became swollen, although not painful. Pain did not develop until six days later, the day preceding admission.

On examination, the right arm, forearm and hand were moderately swollen. There were several recent blisters on the forearm from the application of hot packs. The hand was quite red with a suggestion of cyanosis. The median basilic and cephalic veins were dilated as well as the superficial veins over the upper arm and shoulder. The thrombosed axillary vein was readily palpable and very tender. The radial pulse was strong. Temperature was normal and remained so. Pulse was 70 and respirations, 18.

X-ray examination of the upper extremity was normal. There were no other abnormal physical findings.

Diagnosis.—Thrombosis of right axillary vein.

The arm was kept in a state of complete rest, in an elevated position and with a continuous application of hot packs for fifteen days with complete disappearance of all signs and symptoms. He was discharged from the hospital on May 12, 1937, his eighteenth hospital day, with his arm in a sling.

His convalescence continued uneventfully and when last seen six months after discharge he had a perfectly normal anatomical, physiological and functional condition of the right upper extremity and axilla.

Case 2.—Mrs. W. W., a forty-seven-year-old housewife, was admitted to the hospital on September 15, 1941, giving a history of the onset of discomfort in the left axilla several days ago which actually became painful yesterday and at that time she noted a tender, reddish, cordlike mass in the axilla.

Examination showed a moderately firm, discolored, tender, swollen left axillary vein. There was no swelling of the remainder of the extremity. The radial pulse was strong. Temperature was 98.4°, pulse, 70 and respirations, 18. The white blood count was 9,000. All other laboratory and physical findings were normal.

Diagnosis.—Thrombosis of left axillary vein.

The arm was elevated, immobilized and ice packs applied thereto. This therapy was maintained for ten days with a gradual reduction in size of the axillary vein and a disappearance of all discoloration. The extremity was very gradually mobilized and the patient was discharged from the hospital with the arm in a sling on October 6, 1941, her twenty-first hospital day. There has been no recurrence.

Case 3.—Mr. E. H., single, a twenty-one year old shipping clerk, was admitted to the hospital on June 6, 1941, giving the following history.

About three weeks preceding admission, he had pain, swelling and redness of the right upper extremity after itching and curving a ball. He consulted a doctor who advised hot packs which the patient applied evenings as he continued to work. The soreness gradually subsided but there was still stiffness and some residual swelling present yesterday when he again threw a ball, this time very cautiously. He has had a recurrence of the pain, swelling and redness of the entire right upper extremity today.

Examination showed the right upper extremity to be markedly swollen, edematous and red, the fingers being cyanotic. There was also swelling and redness over the anterior chest wall. There was a large, very tender, cordlike mass extending through the axilla from the chest wall well down onto the forearm. The right biceps measured $12\frac{5}{8}$ inches and the left, 11 inches; the right forearm, $11\frac{1}{4}$ inches and the left, 9 inches. The radial pulse was strong. Temperature was 99.4° , pulse, 88 and respirations, 20. The white blood count was 12,000. There were no other abnormal findings.

The patient was put to bed with his right arm elevated and immobilized. Large ice packs which later were changed to hot packs were applied. He was placed on sulfathiazole. During the first ten days he received only partial relief from his pain and the extremity remained swollen but from that point on there was a slow but steady improvement. He was discharged on July 19, 1941, his thirty-third hospital day, his right biceps still 2 inches greater than the left and the forearm 1 inch greater.

He was observed at the office for the following five months during which period the swelling receded still more and he was allowed more and more activity. He had some difficulty on returning to work because of pain and weakness.

When last seen he had just enlisted in the army air corps, his right arm still somewhat swollen but comfortable as long as his activity was not too strenuous.

Discussion

DR. RICHARD CRANMER: Dr. Anderson has said that heat applied to a thrombosed vessel stimulated the metabolic processes in the vicinity of that vessel and sometimes because of that there was a sloughing. Dr. Hoffert has used both heat and cold in the presence of thrombosis and my question to him is, "What, in his opinion, is the comparative value of the two as he has observed it?"

DR. HOFFERT: I believe that in general the application of moist heat is more effective than the application of cold in the treatment of this lesion in addition to being more comfortable to the patient. In those instances in which the application of cold is resorted to, I do not think it wise to apply it continuously, but it is better to apply it at intervals of an hour. Some prefer to alternate between the application of heat and cold.

Vitamins have little effect on wound healing, according to Dr. Edward L. Howes of Columbia. Extreme vitamin C deficiency may delay wound healing. Early débridement is the only way to remove contaminants, and a pair of scissors, some novocaine and a look inside of every traumatic wound is essential to good surgery. These procedures must not be abandoned in favor of any magic powder. About 10 per cent of wounds have streptococcus contamination when first seen and another 60 per cent which must be treated as open wounds receive streptococcus contamination from the human attendant unless strict asepsis is observed. Sulfonamide powders are desirable in handling an open wound.

In Memoriam

Thomas Chalmers Clark

Dr. T. C. Clark, formerly of Stillwater, died June 19, 1942, at Washington, D. C., where he had lived for the past three or four years.

Dr. Clark was born in Quincy, Massachusetts, April 22, 1853, the son of Rev. Nelson and Elizabeth Gilman Clark. He was educated in the public schools of that state and at Bristol Academy, Taunton, Massachusetts, graduating in 1870. That same year he came to Stillwater, Minnesota, and taught school until 1877 when he began to study medicine under Dr. W. H. Pratt. He graduated from Rush Medical College, Chicago, as valedictorian of his class in 1881.

Dr. Clark was a member of the Washington County Medical Society, the Minnesota State and American Medical Associations, the Association of Military Surgeons of the United States and was a charter member of the Minnesota Public Health Association. He was actively identified with the Minnesota National Guard for twenty years, a major and surgeon of the 12th Minnesota Volunteer Infantry and surgeon in charge of the Third Division Hospital of the First Army Corps in the Spanish American War.

Dr. Clark was a member of the First Presbyterian Church of Stillwater and was active in the Masonic Order. He was also a member of the Sons of the American Revolution. For a number of years he was the physician at the Soldiers Home.

Dr. Clark was much interested in tuberculosis and worked hard in the early anti-tuberculosis campaign. In 1902 he submitted to the Washington County Medical Society the resolution approving the establishment of a tuberculosis sanatorium by the state. A bill drawn by him in conjunction with Dr. Harper Workman of Tracy was presented to the legislature but was defeated when a legislator stated it was for the benefit of the doctors only.

Dr. Clark was married in 1882 to Sarah A. Stevens of New York City. His wife died in 1899. Later he married Mary R. Breckenridge of Decorah, Iowa, who also preceded him in death. He is survived by three sons, Stephens Clark of British Columbia; William G. Clark of Washington; Colonel Harold Clark of Washington; and a daughter, Julia Breckenridge Clark also of Washington.

Emily W. Fifield

Emily W. Fifield was born at Manchester, Iowa, January 30, 1858, the only daughter of Reverend L. B. and Emily J. (nee Walworth) Fifield. She attended public schools of Cedar Falls, Iowa, and Lincoln, Nebraska, and later was a student at South Hadley, Massachusetts, at Mount Holyoke and the normal school at Salem, Massachusetts. She received her medical education and graduated from the Women's Medical College at Bal-

timore, in 1884. During the remainder of that year and 1885 she did postgraduate work in Philadelphia and New York.

In 1885 Dr. Fifield started her medical practice in Minneapolis where she did general work, interesting herself largely in gynecology and pediatrics. She attended clinics and studied in Edinburgh and London in 1900. In 1901 and 1902 she continued her postgraduate study in Baltimore under the tutelage of Doctors Osler, Kelly, Russell and Simon. For many years she was physician in charge of the medical work at Bethany Home.

Dr. Fifield was unmarried. She was active in civic affairs, being particularly interested in the Y.W.C.A. She was a member of the Park Avenue Congregational Church until she retired in 1919, when she moved to Los Angeles, California, where she lived until her death September 22, 1941.

Leonard Forrest Woodworth

Dr. L. F. Woodworth, for thirty-one years a practitioner at Le Center, Minnesota, died June 18, 1942, of a heart attack at the age of sixty-two.

Dr. Woodworth was born January 30, 1880, at Shenandoah, Iowa. He received his M.D. from the University of Iowa in 1908 and soon began practice in Le Center. His early years of practice were in the days of poor roads and when the horse and buggy were largely required.

He was a member of the Scott-Carver County Medical Society until 1940, when he transferred to the Nicollet-Le Sueur Society. He was automatically a member of the Minnesota State and American Medical Associations. He was also a member of the St. Peter Knights Templars.

He had practiced in the same community for thirty-one years and his jovial disposition and friendly smile, as well as his readiness to serve his community, state and nation gained him many friends. He was deeply interested in conservation and took an active part in the Izaak Walton League, enjoying hunting and fishing. For many years he served as health officer and was chairman of the Boy Scouts for a period of years.

Dr. Woodworth married Bertha Fickling on September 9, 1914, in Le Center. Mrs. Woodworth died in 1936. One son, Leonard, was born to this union and is now in the flying service.

"DATED" VITAMINS

"Dated" vitamins may presently become necessary, as a result of the discovery that oxygen is an enemy of vitamin D. This discovery was reported by Dr. J. C. Fritz, Dr. J. L. Halpin, Dr. J. H. Hooper and Dr. E. H. Kramke of Borden's Nutritional Research Laboratory at Elgin, Ill. They found that vitamin D, both natural and synthetic, deteriorated on standing, and have evidence that oxygen in the air was the cause of the mischief. They were able to protect the vitamin by applying protective coatings to the substances on which it was adsorbed, or by placing it in containers in which air had been replaced by an inert gas.—*Science News Letter*, April 25, 1942.

REPORTS and ANNOUNCEMENTS

CIVIL SERVICE APPOINTMENTS

The United States Civil Service Commission announces available appointments for a rotating internship and for psychiatric residents in St. Elizabeth's hospital, federal institution for the treatment of mental disorders in Washington, D. C. The positions pay \$3,000 a year. Applicants for internship must be fourth-year medical students in a Class A medical school. Applicants for the position of psychiatric residents must have served or be now serving an accredited rotating internship.

The Commission also announces positions as Junior Public Health Nurse, with no age limits, at \$1,800 a year. Registered nurses who have graduated since January 1, 1920, from an accredited school of nursing having a daily average of 100 or more patients and who have completed or are enrolled in an approved course covering one academic year in public health nursing, may apply.

Public Health Nurse positions paying \$2,000 a year are also available for Indian service, including Alaska, and for the Public Health Service. Graduation from high school is no longer required for the public health nurse.

Those interested in any of these positions may secure announcements and application forms from the Commission's representatives at first-class and second-class post offices.

PHYSICAL THERAPY COURSE AT COLUMBIA

Columbia University announces that beginning September, 1942, a program of professional studies for the training of Physical Therapy technicians will be offered. This training and instruction will extend over a two-year period and has been organized in compliance with the requirements set down for such programs by the Council on Medical Education and Hospitals of the American Medical Association. The course is being set up in University Extension in close relationship with the College of Physicians and Surgeons of Columbia University, the Nursing Education and Health and Physical Education Departments of Teachers College. The clinical and laboratory instruction will be given at the Vanderbilt Clinic, Neurological Institute, Presbyterian Hospital and New York Orthopedic Dispensary and Hospital.

Two years or sixty semester hours of college, including courses in Physics and Biology, shall be required, or graduation from an accredited School of Nursing or an accredited School of Physical Education. A Certificate of Proficiency in Physical Therapy will be granted by Columbia University to those completing the course. Further information may be obtained by writing the Office of the Committee on Physical Therapy, Room 303B, School of Business, Columbia University, New York City.

NORTHERN MINNESOTA MEDICAL ASSOCIATION

The Northern Minnesota Medical Association's annual meeting will be held at the Birchmont Hotel in Bemidji on Saturday, August 29, at 8:00 A. M. The meeting this year will consist of a one-day program and a banquet in the evening. The program is as follows:

"X-ray Diagnosis of Abdominal Disease"
Dr. C. B. Nessa, St. Cloud

"Shock Associated with Burns"
Dr. W. S. Neff, Virginia

"Lumbosacral Pain"
Dr. R. K. Ghormley, Rochester

"Miscellaneous Observations on the Diagnosis and Treatment of Anemia"
Dr. H. Z. Giffin, Rochester

"Acute Dermatological Conditions"
Dr. F. T. Becker, Duluth

The Pathological Conference conducted by Dr. E. L. Tuohy of Duluth, consisting of pathologists and men interested in various fields of medicine, will be held in the afternoon.

Those who attend are urged to bring their questions and problems along for discussion. Ample time will be allowed following each topic for full discussion, so come prepared to contribute as well as to take away ideas.

The local arrangements are in charge of Dr. T. P. Groschupf of Bemidji. A program of entertainment for the ladies is being arranged as well.

AMERICAN COLLEGE OF PHYSICIANS

The American College of Physicians has announced its 27th Annual Session to be held in Philadelphia, Pa., April 13 to 16, inclusive, 1943. Heretofore, the College has held a five-day session, but in the interest of conserving time and expense of its members, the program will be condensed into four days, Tuesday through Friday. The general management of the session and technical exhibits will be handled by the Executive Secretary, Mr. E. R. Loveland, 4200 Pine St., Philadelphia.

CENTER FOR STUDY OF INFANTILE PARALYSIS

The National Foundation for Infantile Paralysis has made a five-year, \$300,000 grant to Johns Hopkins University for an intensive and long time study of infantile paralysis. It will be used to establish and conduct the Center for the Study of Infantile Paralysis and Related Viruses at Hopkins. The choice of Hopkins was made because it was felt that there the staff

of epidemiologists, virologists, serologists, neurologists and chemists required for a comprehensive study of the disease was already available. Work at the Center will be under the direction of Dr. Kenneth F. Maxcy, professor of epidemiology in the School of Hygiene and Public Health. The funds which make this research project of the National Foundation possible are contributed each year at the time of the national celebration of the President's birthday.

PUBLIC HEALTH FELLOWSHIPS

The Commonwealth Fund of New York, the foundation established in 1918 by the late Mrs. Stephen V. Harkness, has announced through the Pan-American Sanitary Bureau, the establishment of fifteen fellowships for a one-year study of public health subjects or postgraduate medical courses for properly qualified citizens of the other American republics.

The Pan-American Sanitary Bureau, the international health agency of the American republics already has nearly 100 Latin Americans studying medicine and public health in the United States.

MISSISSIPPI VALLEY MEDICAL SOCIETY

The annual meeting of the Mississippi Valley Medical Society, which embraces the states of Iowa, Illinois and Missouri, will be held at the Hotel Lincoln-Douglas, Quincy, Illinois, September 30, October 1 and 2, 1942.

The three-day program of lectures, clinics and instructional courses is especially designed for general practitioners and constitutes a short postgraduate course.

Membership fee and first year's dues of \$5.00 include subscription to the official publication the *Mississippi Valley Medical Journal*. Annual dues thereafter are \$3.00. Free registration is given to army and navy physicians.

For further information address Dr. Harold Swanberg, secretary, 209 W.C.U. Building, Quincy, Illinois.

FOR SALE—Office equipment in city of 15,000. Discontinuing practice because of ill health. Ideal location for physician able to do general surgery. Especially desirable for Catholic physician. Address D-26, care MINNESOTA MEDICINE.

WOMAN'S AUXILIARY

MRS. RAYMOND J. JOSEWSKI, *President*
Stillwater, Minnesota

MRS. W. H. RUCKER, *Publicity Chairman*
Minneapolis, Minnesota

Mrs. Raymond J. Josewski of Stillwater was elected president of the Minnesota Woman's Auxiliary at the annual meeting held June 29, 30 and July 1 in Duluth in conjunction with the meeting of the State Medical Association. She succeeds Mrs. John J. Ryan of Saint Paul, who presided at business sessions of the Executive Board and the state organization.

Other officers elected at the annual meeting are:
President-elect—Mrs. F. S. McKinney, Minneapolis
First vice-president—Mrs. Neil Dungay, Northfield
Second vice-president—Mrs. W. N. Graves, Duluth
Third vice-president—Mrs. L. P. Howell, Rochester
Recording secretary—Mrs. E. V. Goltz, St. Paul
Treasurer—Mrs. Henry Quist, Minneapolis
Auditor—Mrs. J. A. Thabes, Sr., Brainerd
Historian—Mrs. O. B. Fessenmaier, New Ulm

Honorary membership was conferred upon Mrs. James Blake of Hopkins because of her outstanding service to state and national auxiliaries.

The St. Louis County Auxiliary, hostesses to the visiting women, planned the program and made arrangements for all social events.

Convention visitors were guests at a tea at the Duluth Women's Club on the opening day and that evening joined the Medical Association for an informal dance and floor show at the Hotel Duluth. The Annual Meeting and luncheon which followed were held at the Northland Country Club. George S. Corfield, Professor of Geography at the Duluth State Teachers College, was the guest speaker. His talk, titled "Lands of the New World Neighbor," was timely, entertaining, and well-received.

Mrs. Frank N. Haggard of San Antonio, Texas, president of the national auxiliary, was a guest at the round-up breakfast on Wednesday morning.

It was felt that Duluth has excellent facilities for entertaining conventions and that the St. Louis County auxiliary deserves commendation for its hospitality and skillful handling of housing, transportation and program.

MRS. L. P. HOWELL,

Recording Secretary.

Dr. and Mrs. Carl Simison of Barnesville are the parents of a son born June 10.

* * *

A son was born to Dr. and Mrs. C. W. Jacobson of Thief River Falls, July 9. Dr. Jacobson is associated with the Bratrud Clinic in that city.

* * *

Dr. David P. Anderson, surgeon at the Austin Clinic in Austin, reported last month for duty at Fort George Wright, Spokane, Washington, where he is a captain in the medical corps of the air force.

* * *

Dr. and Mrs. E. G. Knight of Randall have moved to Swanville where Dr. Knight will practice for a limited time, as a young doctor has been declared necessary to that community during the emergency.

* * *

Dr. A. A. Schmitz, formerly of the Mesaba Clinic at Hibbing, has become associated with the Mankota Clinic in Mankato. Dr. Schmitz was graduated from the University of Minnesota Medical School in 1937.

* * *

A new faculty appointment at the University of Minnesota Medical School is that of Dr. Ferdinand L. P. Koch of Saint Paul who has been named clinical assistant professor of ophthalmology on a half-time basis.

* * *

Dr. Bayard T. Horton of Rochester presented a paper, "Headaches, Recent Advances in Treatment," at the seventy-fifth annual meeting of the West Virginia State Medical Association at Huntington, July 13-15.

* * *

A grant of \$10,700 has been given the University of Minnesota by the National Foundation for Infantile Paralysis to support research on infantile paralysis being carried on by Dr. Herman Kabat, University of Minnesota physiologist.

* * *

Dr. H. R. Rice of Roseau reported last month to the Great Lakes Naval training station in Great Lakes, Illinois, for active duty in the navy medical corps. He holds the rank of lieutenant commander, and has been assigned to the surgical unit.

* * *

Dr. Earl Wood of Mankato has been named to do medical research in aeronautics for the government at the Mayo Clinic at Rochester. A graduate of the University of Minnesota Medical School, Dr. Wood has been on the staff of Harvard University Medical School's pharmacology department.

* * *

Commander T. B. Magath of the United States Navy, formerly of Rochester, spent a week in Rochester last month giving a series of lectures on tropical medicine at the Mayo Foundation. The lectures were for re-

serve officers of the United States Army and Navy who are in Rochester on special detail for training.

* * *

Dr. Edward Francis Walsh and his bride, the former Miss Alberta Ruth Schroeder, who were married in Saint Paul, June 27, are now living at Carlisle Barracks, Pennsylvania, where Dr. Walsh is a first lieutenant. He was graduated from the University of Minnesota Medical School in June.

* * *

The fourth-story addition to the main building of the Mineral Springs Sanatorium at Cannon Falls, was expected to be ready for occupancy about August 1. The new quarters are to be used for patients able to go to the dining room for meals, and also for room for employees.

* * *

Donald Duncan, Ph.D., associate professor of anatomy, University of Texas Faculty of Medicine at Galveston, Texas, has been appointed professor and head of the department of anatomy at the University of Buffalo School of Medicine, Buffalo. Dr. Duncan received his Ph.D. at the University of Minnesota in 1929.

* * *

Dr. A. E. Henslin who has been in practice in LeRoy for almost a half a century—since 1893—was guest of honor at a party given by members of the Rebekah and Odd Fellows lodges on his seventy-seventh birthday anniversary. Dr. Henslin, who was born near Racine, June 20, 1865, has been a member of the lodge ever since he came to LeRoy.

* * *

Appointment of Commander W. McK. Craig to Rochester as chief of neuro-surgery in the Naval Hospital at the National Naval Medical Center in Bethesda, Maryland, is announced.

Commander Craig who has been stationed at the Naval Hospital in Corona, California, visited his family in Rochester for several days last month before proceeding to his new station.

* * *

Officers of the Southwestern Minnesota Sanatorium district were re-elected at the annual board meeting held in Worthington, July 3.

They are Dr. C. L. Sherman of Luverne, president; Edwin Brickson of Adrian, vice president; N. L. Zender, St. James, member of the executive committee.

Dr. S. A. Slater of Worthington, superintendent of the sanatorium, remains as secretary of the board.

* * *

Dr. Bernard Nauth has joined the staff of the Winona Clinic in Winona, to remain until such time as military demands take him away, it is announced by the clinic. Dr. Nauth is the son of Dr. Walter W. Nauth, long-time resident of Winona, and is a grad-

uate of the University of Minnesota Medical School. During the past year, he interned at San Bernardino County hospital in San Bernardino, California.

* * *

Staff promotions recently announced at the University of Minnesota Medical School by Dr. Harold S. Diehl, dean of medical science, follow:

Dr. Arild E. Hansen promoted from associate professor of pediatrics to professor.

Dr. Joseph T. King promoted from assistant professor of physiology to associate professor.

Dr. Herman Kabat promoted from instructor of physiology to assistant professor.

* * *

Dr. Edward G. Huber, assistant dean of the Harvard school of public health and chief of the orthopedic unit of the Massachusetts state department of health, visited in Winona, his boyhood home, last month en route from Boston to Minneapolis. Dr. Huber was among the enrollees in the course given for physicians in the Kenny technique for treatment of infantile paralysis. Mrs. Huber accompanied him.

* * *

The National Foundation for Infantile Paralysis, Inc., has made available a booklet entitled, "The Kenny Method of Treatment for Infantile Paralysis," written by Drs. Wallace H. Cole (Saint Paul), John F. Pohl and Miland E. Knapp (Minneapolis), who have observed the Kenny method during the time the Foundation has financed a study of the treatment at the University of Minnesota School of Medicine, Minneapolis.

* * *

Dr. Gaylord W. Anderson, head of the department of preventive medicine and public health at the University of Minnesota, has been called to Washington, D. C., to become head of the education subdivision of the Venereal Diseases Control Division of the War Department, Office of the Surgeon General. He holds the commission of Major.

Acting head of the department during his absence will be Dr. Ruth E. Boynton, who will also continue as director of the Students' Health Service.

* * *

Dr. P. C. Welton, superintendent of the Buena Vista Sanatorium, Winona and Wabasha County institution, has resigned his position there and will leave the latter part of August for Tucson, Arizona, where he will be the chest specialist at a private clinic.

Replacing Dr. R. R. Hendrickson, who left to become superintendent of the Sand Beach Sanatorium near Detroit Lakes, Dr. Welton has been head of the institution located at Wabasha for the past year.

Dr. W. J. Cochrane of Lake City is president of the sanatorium commission.

* * *

The medal awarded annually by the Southern Minnesota Medical Association for outstanding exhibit at the state medical meeting was presented to

Sunburned Lady in Distress

When sun-frazzled patients turn in an alarm for quick relief—answer the call with cooling, emollient NUPERCAINAL, "Ciba." This local anesthetic, analgesic unguent fights the "fire," pain and other discomforts of inflamed and sunburned skin for many, many hours.

YEAR 'ROUND USE of NUPERCAINAL* for speedy mitigation of pain and itching includes conditions such as mild burns, dry eczema, decubitus, intertrigo, fissured nipples, etc. Your pharmacist can supply NUPERCAINAL in one-ounce tubes and from one-pound jars.

NUPERCAINAL, "Ciba"

*Trade Mark Reg. U. S. Pat. Off. Ward "Nupercainal" identifies the product as alpha-butylaxycinchonic acid diethylethylenediamide in lanolin and petrolatum, an ointment of Ciba's manufacture.

MEDICINE—Two Weeks Intensive Course will be offered starting October 5th. Two Weeks Course in Gastro-Enterology will be offered starting October 19th. One month course in Electrocardiography and Heart Disease every month, except August and December.

FRACTURES AND TRAUMATIC SURGERY—Two Weeks Intensive Course will be offered starting September 21st. Informal Course available every week.

GYNECOLOGY—Two Weeks Intensive Course will be offered starting October 5th. Clinical and Diagnostic Courses every week.

OBSTETRICS—Two Weeks Intensive Course will be offered starting September 21st. Informal Course every week.

OTOLARYNGOLOGY—Two Weeks Intensive Course will be offered starting September 14th. Clinical and Special Courses every week.

OPHTHALMOLOGY—Two Weeks Intensive Course will be offered starting September 28th. Five Weeks Course in Refraction Methods starting October 19th. Informal courses every week.

ROENTGENOLOGY—Courses in X-ray Interpretation, Fluoroscopy, Deep X-ray Therapy every week.

General, Intensive and Special Courses in All Branches of Medicine, Surgery and the Specialties.

**TEACHING FACULTY — ATTENDING
STAFF OF COOK COUNTY HOSPITAL**

Address: Registrar, 427 S. Honore St., Chicago, Ill.

Drs. A. H. Wells, S. H. Boyer, Jr., and R. L. Nelson, all of Duluth, at the 89th annual convention at Duluth last month. Their exhibit was "Calcified Nodular Disease of Aortic Valve."

Given honorable mention were Dr. Alfred M. Eliott of Bemidji; Dr. F. T. Becker of Duluth; Drs. George M. Higgins and Ray D. Williams of Rochester, Dr. Arthur Gates of Northfield; and Dr. Anderson C. Hilding of Duluth.

* * *

An annual W. J. and C. H. Mayo Memorial Lectureship in the field of medicine and surgery has been established at Dartmouth College in Hanover, New Hampshire, with funds contributed by Dr. and Mrs. Waltman Walters of Rochester. Mrs. Walters is the daughter of the late Dr. W. J. Mayo and Mrs. Mayo.

Administration of the lectureship has been entrusted to the Dartmouth Medical School from which Dr. Walters was graduated in 1917.

The memorial, it was announced, has been created as "a stimulating factor in interesting men in medicine and surgery and, particularly to call attention to the accomplishments of Drs. W. J. and C. H. Mayo in these fields."

* * *

Dr. Carl L. Eckhardt of Austin, who through unusual circumstances received commissions in both the United States Army and the Navy, left July 2 for Selfridge Field, Mount Clemens, Michigan, to report for duty as a first lieutenant in the Army Air Corps.

Dr. Eckhardt applied for a commission with the Navy last January, but when months passed and he received no call for service, he enlisted with the Army and was granted a commission as a first lieutenant. Just after he took his oath for army service, he received word from the Navy offering him a commission of lieutenant senior grade. But, he was in the Army!

Dr. J. J. Morrow will continue with Dr. Eckhardt's practice, in addition to his own.

* * *

Among physicians recently granted commissions in the Army Medical Corps are:

Dr. William N. Freeman of Perham, first lieutenant, subject to call to active service about August 1.

Dr. Luther F. Davis of Wadena, first lieutenant, who left July 12 to report for duty at Fort Douglas, Utah.

Dr. L. F. Wasson of Alexandria, who expects to be called about August 1 and to be stationed at Fort Sill in Oklahoma.

Dr. Thomas E. Havel of Blue Earth.

Dr. Otis M. Marsh, who has been associated in practice with Dr. W. E. Macklin in Litchfield for the past several months.

Dr. E. Stewart Taylor of Worthington, lieutenant.

Dr. V. W. Carlson of Blooming Prairie, captain in Medical Detachment of the Army Air Corps.

Dr. P. J. Pankratz of Mountain Lake.

Dr. M. E. Lenander of St. Peter, captain, in Medical Detachment of Army Air Corps, ordered to report to Paine Field, Everett, Washington.

Dr. L. E. Sjostrom of Storden.

 Dr. Robert Bailey of Fairmont, lieutenant, assigned Fort Lewis, Washington.
 Dr. R. N. Bowers, Mazeppa's only physician, commissioned a first lieutenant. Dr. Bowers expects to ave for active duty the first part of this month.

* * *

Two Minnesotans, among them a former Rochester physician, were recently given Awards of the Order of the Purple Heart for meritorious services in Burma, is announced by Lieutenant General Joseph W. Stilwell's headquarters at New Delhi, India. Five other officers of non-combat branches of the United States army also received the awards.

Those decorated included Captain John H. Grindley of Milwaukee, formerly of Rochester, and Major Donald M. O'Hara of Janesville, dentist.

Captain Grindlay, formerly of the Mayo Clinic, went from Chungking to the Burma front to perform operations and combat malaria outbreaks. He drove ambulances and helped bury the dead in addition to his surgical work.

Major O'Hara, a dentist, changed to surgery and with Major Gordon E. Seagrave, medical missionary, performed many operations by candlelight, porches of native dwellings serving as operating rooms.

* * *

Dr. Christopher Graham of Rochester was honored by the B.P.O. Elks of that city last month at their annual dinner in honor of an outstanding citizen of Rochester.

Principal speaker at the dinner held July 20, was Dr. Robert D. Mussey, chairman of the board of governors of the Mayo Clinic and former associate of Dr. Graham.

Dr. Graham, eighty-six years old, has been a physician, agriculturist, stock breeder and civic leader. He was the first intern at St. Mary's Hospital in that city in 1895.

He was appointed associate of medicine at the Mayo Clinic in 1904, and head of the division of medicine in 1914. He was professor of medicine in the Mayo Foundation graduate school at the University of Minnesota from 1915 to 1919, at which time he retired from practice.

Dr. Graham was a member of the University of Minnesota's first football team.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

THE MANAGEMENT OF FRACTURES, DISLOCATIONS AND SPRAINS. Third Edition. John Albert Key, B.S., M.D. Clinical Professor of Orthopedic Surgery, Washington University School of Medicine, Associate Surgeon in Barnes, Children's and Jewish Hospitals; and H. Earle Conwell, M.D., F.A.C.S. Orthopedic Surgeon to Tennessee Coal, Iron and Railroad Co., etc., etc. 1303 pages. Illus. Price, \$12.50, cloth. St. Louis: C. V. Mosby Co., 1942.

CIVIL DEFENSE MEASURES FOR THE PROTECTION OF CHILDREN. Report of observations in Great Britain, February, 1941. Martha M. Eliot, M.D., Associate Chief, Children's Bureau, United States Department of Labor, and Member of United States Civil Defense Mission to Great Britain. 186 pages. Illus. Price, 30c, paper cover. Superintendent of Documents, Washington, D. C., 1942.

THE CLARKS, An American Phenomenon. William D. Mangam. With an introduction by Edward Alsworth Ross, Professor of Sociology, University of Wisconsin. 257 pages. Illus. Price, \$2.50, cloth. New York: Silver Bow Press, 1941.

HELP YOUR DOCTOR TO HELP YOU. Series of medical books for laymen. Four books covering Constipation, Heart Disease, High Blood Pressure, and

Insomnia. Editorial board headed by Dr. Walter C. Alvarez, and including Dr. Logan Clendening, Dr. Howard W. Harrard and Dr. Charles W. Mayo. Price, 95c each, cloth. New York: Harper & Bros., 1942.

THE SURGERY OF PANCREATIC TUMORS. Alexander Brunschwig, M.S., M.D., F.A.C.S. Professor of Surgery, University of Chicago. 421 pages. Illus. Price, \$7.50, cloth. St. Louis: C. V. Mosby Co., 1942.

TREATMENT OF THE PATIENT PAST FIFTY. By Ernst P. Boas, M.D., Assistant Clinical Professor of Medicine, Columbia University; Chairman, Committee on Chronic Illness, Welfare Council of New York City. Cloth. 320 pages. Illus. Price \$4.00. Chicago: Year Book Publishers, 1941.

"We are becoming a country of old people." This book by Boas, especially in the introduction and the first three chapters, lists the reasons for this shift in population age levels, and the direct effect this is having on doctors' problems.

The reader will find the essence of this change portrayed in certain striking statements, such as "36½ per cent increase in the elderly among America's population in the last ten years!"

The author tackles the difficult problem of attempting to differentiate among the aging the influence of trauma, disease, bad habits, and faulty nutrition, in hastening senescence, and the factors inherent in the organism (Warthin) which biologically forecast for each individual (barring accident) his life allotment.

REST HOSPITAL

A quiet, ethical hospital with therapeutic facilities for the diagnosis, care and treatment of Nervous and Medical cases. Invites coöperation of all reputable physicians who may supervise the treatment of their patients.

ince it is difficult to take Oliver Wendell Holmes' advice to insure longevity: "Advertise for a couple of parents both belonging to long lived families"—the next best thing is to acquire habits and vocations in keeping with what fate has assigned to you. Boas stresses many items concerned in aging, such as the time when presbyopia supervenes, and shortening and body stooping appear, as indications of wavering of the life line.

Problems based upon psychological hurdles, stemming from fear of unemployment and dependency, are given part of the consideration they richly deserve.

The rest of the book is given over to short up-to-date summaries of present-day medical problems in systemic diseases. Five of eleven segments or chapters are given over to subdivisions of cardiovascular disease. The author (probably wisely) omits many references—where would he stop if he did not!

The information on therapy is compact and well chosen.

I recommend the book highly.

EDWARD L. TUOHY, M.D.

SYNOPSIS OF ANORECTAL DISEASES. L. J. Hirschman. 2nd edition. 315 pages. Illus. Price \$4.50. St. Louis. C. V. Mosby Co., 1942.

The second edition of Hirschman's "Synopsis of Anorectal Diseases" will be a welcome edition to the library of everyone interested in treating rectal diseases. This handbook has been brought up to date by the addition of new illustrations, plates, and ideas. The colored plates depicting the anoscopic and proctoscopic appearance of lesions are excellent.

The chapter on constipation and obstipation is quite complete and should be read by all medical students and men in practice. Incorrect ideas based upon unsound physiological concepts of bowel function are quite prevalent in the minds of many physicians. Dr. Hirschman's presentation of this controversial subject should put his readers on the right track.

The chapter on pruritus ani is very complete and interesting. Dr. Hirschman's long experience in treating these patients places him in a unique position to advise other physicians concerning the pitfalls which can be encountered in treating pruritus ani. The chapter contains many helpful suggestions.

This handbook serves its purpose admirably and practitioners of medicine would do well to refer to it at frequent intervals.

—W. C. BERNSTEIN, M.D.

ESSENTIALS OF GENERAL SURGERY. Wallace P. Ritchie, M.D., Clinical Assistant Professor, Department of Surgery, University of Minnesota. 813 pages. Illus. Price \$8.00. St. Louis: C. V. Mosby, 1941.

This is definitely a textbook for the undergraduate. Although it is a one-volume work, it is entirely adequate; the text has been arranged in a regional fashion, the various surgical diseases are lucidly described, and

BOOK REVIEWS

the conventional form is adhered to without the usual stupidly pedantic ritual.

The treatment for such surgical conditions as should be cared for by the general practitioner are given in sufficient detail, whereas only the general principles of surgical operations are dealt with. For instance, the treatments for burns are given in detail, almost an entire page is devoted to Meleney's zinc peroxide treatment of necrosing pyodermic infections, and only a short paragraph to the radical operation for cancer of the breast.

The chapters on Orthopedic Surgery and on Fractures and Dislocations would each be an excellent *vade mecum* for the general practitioner.

The pictures are typical of the conditions they are supposed to illustrate, and do not impress one as having been taken from Gould and Pyle, as is often the case in books of this type.

This is an excellent students' manual of surgery which would be a useful book in any doctor's library.

The bibliographies are up to date and the articles referred to have been selected with discrimination.

HARRY B. ZIMMERMANN, M.D.

* * *

This is a valuable book on surgery for the student and also for the physician in practice. Dr. Ritchie makes no pretense to exhaustive description of any of the surgical subjects touched upon in his book. "Essentials," or the key word in the title, really spells the

excellence of this valuable treatise on surgery. Those of us who have done surgery during the past two decades realize what a boiling down process or simplification of methods has occurred. That makes a book of this sort possible today. Any subject one chooses at random from the index is treated with clear-sighted precision, with all frills omitted. I like the list of references appended to each chapter which one may use if he feels the need of elaboration. It is a very handy volume.

ARTHUR N. COLLINS, M.D.

FUNCTIONAL PATHOLOGY. Leopold Lichtwitz. 567 pages with 157 figures and 37 tables. Price \$8.75. New York: Grune & Stratton, Inc., 1941.

This is one of the best books about pathologic physiology published to date. Practically the whole field of medicine is touched upon in the discussions. While one may not always agree with the author's conclusions, one must agree that they are logical and always productive of thought. The chapters on Hypertension, Thyroid and Renal Diseases are particularly good. The author's excursions into the realms of philosophy and history are diverting and appropriate. His description of the patient with chronic arthritis (page 253) is beautifully written. The book is well illustrated and the printing and binding excellent. This volume should enjoy a wide popularity.

FOR NERVOUS DISORDERS

Operated In Connection
with

Homewood Hospital

Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.

YOUR USE OF

BENZEDRINE SULFATE TABLETS

Any potent drug should be administered under medical supervision, and Benzedrine Sulfate* is no exception.

In medical literature, the majority of the reports of undesirable reactions attributed to Benzedrine Sulfate have been traceable to cases of indiscriminate or unsupervised use. This is equally true of the often magnified and sensational reports in the lay press.

Obviously, these unfavorable reports greatly retarded the wider clinical use of this valuable therapeutic agent. From the very beginning, Smith, Kline & French Laboratories—as a matter of business judgment, to say nothing of ethical considerations—did what it could to keep Benzedrine Sulfate solely in the hands of the medical profession.

But our own unaided efforts never met with complete success. And, understandably concerned over the possibility of self-medication, certain physicians hesitated to employ Benzedrine Sulfate therapy.

However, when the Federal Food, Drug & Cosmetic Act of June, 1938, became effective, we immediately put Benzedrine Sulfate in the category of drugs to be sold on prescription only. The Act is strictly enforced and is supplemented by similar legislation in many states. Today, as a result, the physician can prescribe Benzedrine Sulfate, secure in the knowledge that there is little likelihood of its abuse.

ADRENAL CORTICAL HORMONES ESSENTIAL TO LIFE

Normal Adrenal Cortex

The cortex of the adrenal gland is essential for life in human beings and in all animals which possess this gland. Its removal is fatal within a few days.

Tuberculosis of the Adrenal

The original description of Addison's disease attributed the condition to tuberculosis of the adrenal. Recent autopsy series show that there may be other causes and that these account for a considerable proportion of the cases.

Sterile Solution Adrenal Cortex Extract (Upjohn)

Sterile Solution Adrenal Cortex Extract (Upjohn) is an extract of adrenal glands from domestic animals, containing the cortical steroids essential for the maintenance of life in adrenalectomized animals, but so purified that only traces, at the most, of epinephrine are present. Each cc. contains not less than 50 dog units of cortical activity (2.5 rat units) when assayed by the method of Cartland and Kuizenga (American Journal of Physiology 117:678, 1936).

Sterile Solution Adrenal Cortex Extract (Upjohn) is of value in cases of Addison's disease or of adrenal cortex insufficiency, and in surgical procedures involving the adrenal gland, such as removal of cortical tumors, as a prophylactic measure to prevent the development of symptoms of adrenal cortex insufficiency.

Sterile Solution Adrenal Cortex Extract (Upjohn) is supplied in 10 cc. size rubber-capped vials as a sterile solution for injection.

For Better Radiographic Results, With More Savings in Office Space Investigate the G-E Model R-38

YOU will enjoy many extra radiographic benefits for every dollar invested in the sensibly priced G-E Model R-38 X-Ray Unit. It brings you 100-milliamperere, big-apparatus quality and flexibility—in an area you may have thought far too small to accommodate a combination unit.

Because the R-38 fits so snugly into small space and a restricted x-ray budget, it pays important dividends for every square foot of floor space it uses. And you will be cheered by the unit's ability to provide those dividends for a long time to come. For the R-38's built-in durability assures long-run economy.

If you want x-ray's benefits but until now have done without them because a combination unit seems too large both physically and as an in-

vestment, investigate the R-38. Clip, fill in, and mail the coupon today for complete and really free information.

Please send complete information about the compact, rightly priced G-E Model R-38 Combination X-Ray Unit.

What's completeness got to do with this baby's health?

THE COMPLETENESS of Biolac is a double health safeguard for infants.

Biolac provides for *all* nutritional needs of young infants, *except* vitamin C, and it requires simply dilution with boiled water. It thus minimizes the incidence of upsets arising from either formula contamination or unintentional omission by mothers of important formula ingredients.

This completeness of Biolac assures you that the baby will get *all* the nutritional elements you prescribe . . . in amounts equal to or exceeding recognized requirements for optimal growth and health.

The advantages of Biolac's completeness extend also to the busy mother, whose

time and energy are saved through the speed and simplicity of preparing Biolac formulas.

You'll fully appreciate the many advantages of Biolac when you prescribe it regularly in your own practice. For professional information, write Borden's Prescription Products Division, 350 Madison Avenue, New York City.

★ ★ ★

Biolac is prepared from whole milk, skim milk, lactose, vitamin B₁, concentrate of vitamins A and D from cod liver oil, and ferric citrate. It is evaporated, homogenized, and sterilized.

Our Job

We people of the United Nations have a considerable job on our hands. We must win the war. All that makes life worth living is at stake. We cannot all serve with the armed forces, but we can all do our bit. There is a job for everyone of us.

Much has been written about Civilian Morale and its importance to our war effort. What is Civilian Morale? In its best sense, is it not a feeling of confidence, shared by people with mutual beliefs and hopes and interests, that sustains a nation during any period of emergency or great stress? Is it not, in fact, an expression of national character?

At no time in our history has there been a greater need for confidence; confidence in our leaders, in our armed forces, in our physical and spiritual resources, in ourselves—confidence in all of these forces working together towards Victory, towards the preservation of those ideals and practices of liberty, justice, individualism and decency which are essential to our way of life, to our fundamental heritage.

Let those of us who for one reason or another cannot serve with the armed forces give as much of our time as possible to Civilian Defense, as much of our money as possible to the buying of War Bonds and Stamps, and every vestige of our national spirit, pride, determination and courage to the winning of the war. That is our job!

PHYSICIANS' PRESCRIPTIONS for Lilly products could not be filled in Oregon and Vermont, South Africa, and Brazil if test-tube methods were used in drug manufacture. Before a new compound can be made available for general use, the steps devised for preparation in the research laboratory must be adapted to large-scale production. This is a job for chemical engineers in the Lilly Pilot Plant. Here yields may be changed from milligrams to pounds but the final product must meet the original specifications so carefully worked out by the research chemist.

RECENT TRENDS IN CANCER RESEARCH

H. B. ANDERVONT

Principal Biologist, National Cancer Institute,
National Institute of Health
Bethesda, Maryland

THE word "trend" signifies the development in a general direction which has taken place in cancer research during the past few years. Four trends will be discussed at this time.

1. Inbred animals and their use in cancer studies.
2. The study of naturally occurring products in the body which are of importance in the occurrence of mammary cancer in mice.
3. Chemical substances which produce cancer in experimental animals.
4. Recent work on virus-induced tumors.

Inbred Animals and Their Use in Cancer Studies

The term inbred is applied only to those strains of mice which have been bred brother-to-sister for at least twenty generations. This prolonged inbreeding produces a strain of mice in which all animals may be regarded as identical twins, and the establishment and use of such strains have done much to reduce the number of variables encountered in the study of experimental cancer. This study includes three groups of malignancies: spontaneous tumors which arise in normal untreated animals, induced tumors which are caused by the administration of certain chemicals, and transplantable tumors which are propagated by implanting a piece of tumor into the tissues of another host. During recent years a series of investigations² have been carried out with inbred strains of mice to determine the outstanding and comparative characteristics of the various strains relevant to tumor development,

so that it can be known which strain supplies the most desirable test animals for any given phase of cancer work.

The strains differ in the order of their susceptibility to subcutaneous tumors induced by chemical carcinogens. The susceptibility of a strain is determined by the period of time elapsing between the administration of a known amount of the carcinogen and the appearance of a tumor at the site of injection. In the more susceptible strains 0.8 mg. of 1,2,5,6-dibenzanthracene dissolved in lard induces tumors in the average time of 18 weeks while in the more resistant strains the same dosage requires an average time of 36 weeks. These inbred strains offer the worker who desires to study variations in susceptibility to induced tumors an opportunity to do so without the use of animals of different species which may introduce complicating factors.

The strains also exhibit wide variations in their susceptibility to the development of spontaneous mammary gland tumors. The breeding females of certain strains have an incidence of almost 100 per cent while the breeding females of other strains have an incidence of less than 1 per cent. Strains in which the breeding females develop breast cancer reveal a striking difference in the incidence of tumors in the non-breeding females. For example, the mammary cancer incidence is almost 100 per cent in non-breeding strain C3H females while in strain A it is 5 per cent and in strain dba it is 50 per cent. This wide range in susceptibility to spontaneous mammary cancer presents excellent material to investigators who wish to work on the induction, prophylaxis or therapy of this type of neoplasm.

² Résumé of the George Chase Christian Lecture, delivered April 5, 1942, at the University of Minnesota.

The incidence of spontaneous pulmonary tumors has been determined in some of the mice strains. This type of tumor is not common in most species of animals but it occurs with exceptional frequency in mice. Strain A mice are by far the most susceptible to spontaneous tumors of the lung for at the age of eighteen months 85 per cent of the animals have developed this neoplasm.

Studies in the susceptibility of the strains to pulmonary tumors induced by chemical compounds have produced some very interesting results. Pulmonary tumors were induced when the compounds were fed, inhaled, applied percutaneously, or injected subcutaneously, intraperitoneally, or intravenously. This reveals that a carcinogen may produce a tumor in an organ remote from the site of its administration.

One striking feature of the pulmonary tumor studies is the correlation between susceptibility to the development of spontaneous pulmonary tumors and susceptibility to the induced pulmonary growths. Those strains which develop the most spontaneous tumors are most susceptible to the induced tumors. It is known that in mice susceptibility to both spontaneous and induced pulmonary tumors is inherited according to genetic principles, and the question arises whether the carcinogens evoke pulmonary tumors by releasing an inherited tendency or by acting directly upon the tissues of the lung.

The natural resistance of eight inbred strains to two transplantable sarcomas has been determined. The tumors used in this work were sarcoma 37 and sarcoma 180, both of which are well-known propagable growths and have been used extensively for experimental purposes in laboratories throughout the world. Natural resistance of the mice was determined by implanting a small amount of tumor just beneath the skin in such a manner that the ensuing tumor was not firmly attached to the underlying subcutaneous tissues. These tumors have been designated as cutaneous growths and have been found to be a more delicate test for natural resistance than the implantation of tumor within the subcutaneous tissues.

Sarcoma 37 grew in all strains for seven to ten days and then regressed in all mice of five strains but grew progressively and killed all mice of three strains. Sarcoma 180 grew progressively and killed all mice of seven strains but regressed

in mice of one strain. This indicates that the strains vary remarkably in their degree of resistance to the growth energies of the two tumors. The variation in susceptibility to the growth of transplantable tumors as exhibited by the different strains, together with the temporary growth followed by complete regression in certain strains, offers an opportunity for the chemist and pathologist interested in the problem of growth and regression of transplantable tumors.

When appropriate hybrid mice were tested for natural resistance to sarcoma 37 it was shown that susceptibility to the growth of this tumor is inherited as a dominant characteristic. Up to the present time the more careful genetic studies show that susceptibility to the development of spontaneous, induced, or transplantable tumor is inherited in a dominant manner.

The use of inbred strains of mice has revealed that there is no correlation between the susceptibility to the induction of subcutaneous tumors and the natural resistance to the growth of transplantable tumors or to the development of spontaneous mammary or pulmonary tumors, and the conclusion is drawn that none of the strains is resistant or susceptible to all types of malignancies. It is inaccurate to speak of mouse strains as of high or low resistance without specifying the type of tumor.

This brief review of the inbred strains of mice indicates that the genetic constitution of the test animal is of fundamental importance in experimental cancer and that the investigation of spontaneous, induced, or transplantable tumors can be simplified by the use of an appropriate strain or strains. Furthermore, the confusing results which may accompany the use of ordinary "market or stock" animals can be avoided. Workers in the field of experimental cancer are indebted to the geneticists who have made possible and have developed such valuable material for investigative work.

The Study of Naturally Occurring Products in the Body Which Are of Importance in the Occurrence of Mammary Cancer in Mice

This trend in cancer research is an outgrowth of the trend we have just discussed, for, without the development of high- and low-mammary-cancer strains, the transmission through the mother of the influence responsible for the occurrence

f mammary cancer in mice could not have been demonstrated. The breeding of high cancer strain females to low cancer strain males produced offspring which developed mammary cancer, while the breeding of low-cancer-strain females to high-cancer-strain males resulted in offspring which did not develop this type of neoplasm. Next it was found that foster nursing of mice of strains with a high incidence of mammary cancers by females of strains with a low incidence reduced the incidence in the fostered females, and, conversely, foster nursing of mice of strains with a low incidence by females of strains with a high incidence increased the incidence in the fostered females.

Intensive studies have revealed that at least three factors are involved in the occurrence of mammary cancer in mice. These are: the milk influence, the genetic, and the hormonal.

Little need be said concerning the milk agent for this was ably discussed by Dr. J. J. Bittner⁹ in the 1940 lecture of this series. Only a few of the more recent observations will be mentioned. It is now known that the agent is widely distributed throughout the body for it has been found in the spleen, lactating gland, and whole blood.²⁵ It is also present in mammary tumors. It is filterable and able to survive a certain amount of glycerolization.¹⁰ It produces definite morphologic changes in the architecture of the mammary gland²³ and these changes may represent precancerous lesions which eventuate into malignancy. This is of considerable interest for it suggests that the agent may be the inciter of a premalignant lesion only and leads to speculation concerning the possibility of other agents producing precancerous lesions in other organs and species and then, unlike the mammary cancer inciter of mice, disappearing or remaining undetectable in the resultant tumor.

Recent work^{11,24} shows that in the ultracentrifuge the agent can be sedimented from mouse milk and that the size of the active particle is probably less than that of some of the larger known viruses such as vaccinia virus. Further results on the identification of the agent are awaited with interest.

There is clear-cut evidence that the incidence of mammary cancers in mice is directly proportional to the time the newborn spend with their mother, that is, the amount of milk they ingest during the first hours of life. Mammary tumors

will occur in mice which have remained with their high-cancer-strain mother for only three hours after birth and the feeding of as little as 0.1 c.c. of high-cancer-strain milk will cause tumors in susceptible mice. This implies that an event occurs in the first few hours of life which leads to the development of malignancy in normal untreated mice when they are from seven to eighteen months of age. The importance of this fact must be realized when the epidemiologist attempts to correlate the occurrence of mammary gland tumors with the ingestion of mother's milk in other species of animals.

The genetic factors in the occurrence of mammary cancer in mice control the degree of susceptibility to both the milk influence and the hormonal influence. The earlier investigators showed the importance of the genetic influence when they developed strains of mice which were of high or low susceptibility to mammary cancer and it was generally conceded that the genetic constitution of the mouse was one of the essential factors involved in the occurrence of this neoplasm.

Following the discovery of the extrachromosomal influence present in mother's milk, experiments were performed to ascertain the relationship between this influence and the genetic make-up of the animal. This was accomplished⁴ by breeding high-tumor-strain females to low-tumor-strain males which produced the F_1 hybrid generation and it was found that these hybrids showed a high incidence of mammary tumors. When, however, these hybrid females were mated to resistant males the resultant first-backcross-generation exhibited a low incidence of tumors, and further breeding of the first-backcross-generation females to resistant-strain males produced mice which were almost free from mammary tumors. The use of females from high tumor lines and in all the hybrid generations permitted the passage of the milk influence to subsequent generations, but the genetic influence introduced by the males of low cancer strains rendered the animals resistant to mammary cancer. This type of experiment showed clearly that the genetic constitution of the mouse is of considerable importance in determining whether it will develop a tumor of the breast.

The exact rôle played by the genetic influence is obscure. It may enable the animal to live its allotted span of life without developing tumor

or may enable it to destroy the influence obtained in the milk. A strain of mice may be highly susceptible to mammary cancer because their genetic make-up enables them to propagate the milk influence while a low tumor strain may possess genetic factors which make them incapable of propagating the influence. The disappearance of tumors in hybrids in which the chromatin of resistant strains predominate tends to support this speculation. Furthermore, it was found⁵ that strain C mice which develop few spontaneous mammary tumors are highly susceptible to the milk influence of a high tumor strain and are able to transmit the influence through subsequent generations. Strain C mice may be regarded as possessing the genetic factors necessary for the establishment of a high-mammary-cancer strain but remain a low cancer strain until the introduction of the milk influence. Strain C57 Black mice differ from strain C mice in that they are much more resistant to the milk influence and do not transmit the influence through successive generations. Their genetic factors may enable them to destroy the influence.

These studies on the importance of heredity in the mouse should be kept in mind in any discussion concerning the effect of heredity upon the occurrence of tumors in other species. In mice we have highly inbred strains of animals which are genetically susceptible to mammary cancer as well as an agent which is a powerful cancer inciter, but two generations of breeding are sufficient to overcome both the hereditary tendency and the inciter. This indicates that in other species which do not begin to approach the mouse so far as genetic uniformity is concerned, it is extremely hazardous to predict the occurrence of tumors on the basis of tumorous or nontumorous ancestry.

The hormonal influence was long considered an essential factor in the occurrence of mammary cancer in mice.¹⁴ Male mice of high-mammary-cancer strains do not develop tumors of the breast and, as stated previously, in some strains there is a pronounced difference in the incidence of tumors in breeding and nonbreeding females. This alone is sufficient evidence of the importance of estrogenic hormones in this species. It is also known¹⁹ that cancer of the breast does not occur in females which are ovariectomized when four weeks of age and that males of certain strains will develop mammary tumors following

the administration of estrogenic hormones. The ease with which tumors can be induced in the males by estrogen depends upon their origin; for those from strains in which the females develop many mammary tumors are far more susceptible than those whose female litter mates are resistant to this neoplasm.

The discovery of the milk influence led to investigation of its relationship to the hormonal influence. It was found²¹ that foster nursing of strains with a high incidence of mammary tumors by females from strains with a low incidence reduced the incidence of mammary tumors in estrogen-treated males and that foster nursing of strains with a low incidence by females with a high influence increased the incidence in estrogen-treated males. These findings, together with the pronounced effect of foster nursing upon the occurrence of mammary tumors in females, show clearly that estrogenic hormones are not the chief stimulus in the etiology of mammary cancer in mice. Their function appears to be the preparation of the mammary gland for the activity of the milk influence; for if the milk influence is not present, large amounts of estrogen do not lead to the development of mammary tumors.

The estrogenic substances are, however, naturally occurring products in the body which play an important part in the occurrence of other types of tumors. The administration of estrogen has produced tumors of the pituitary,¹⁵ uterus,¹ testicle²² in the mouse, of the mammary gland¹⁸ in the rat, and of the uterus¹⁸ in the guinea pig.

Chemical Substances Which Produce Cancer in Experimental Animals

This trend has its roots in the observations of Percival Pott who, in 1775, recognized the relationship of soot to the cancer of chimney sweeps. This clinical observation led to a long series of attempts to produce cancer in experimental animals, but it was not until 1915 that Yamagiwa and Ichikawa induced malignant neoplasms by repeated applications of coal tar to the ears of rabbits. The use of coal tar as a carcinogen resulted in a deluge of scientific papers which contributed much to our present knowledge of cancer in experimental animals.

The more recent aspects of this trend is founded in the discovery of a definite chemical related to coal tar and possessing cancer-inducing power. Credit for this brilliant work goes to Professor

Kennaway¹² and his colleagues in London who in 1930 reported that 1,2,5,6-dibenzanthracene possesses carcinogenic properties. Since that time over 200 compounds¹⁷ have been discovered which produce cancer in experimental animals. Only a general picture of this important trend can be given at this time. A few of the more important observations will be mentioned.

1. The structural formulæ of the carcinogens differ and, as yet, there is no possibility of arriving at any generalization regarding molecular structure and ability to produce tumors.
2. Isomers of powerful carcinogenic compounds are not able to produce tumors in experimental animals. These isomers are compounds which have the same empirical formula as do the carcinogens but the atoms are arranged differently in the molecule.
3. In general, those compounds which are carcinogenic produce irritation at the site of injection while those which fail to produce tumors are not irritating, but this is not true in all cases. Indeed, irritating substances such as mustard gas are known to inhibit tumor formation. The fact that some irritating compounds fail to produce tumors while other nonirritating substances do so, raises the question of whether irritation, per se, is responsible for malignancy. The irritation may have to be a special kind of irritation before it is capable of producing tumor formation.
4. One compound, 20-methylcholanthrene, is of special interest since it has been obtained from deoxycholic acid and cholic acid which are constituents of the bile. This suggests that the products of the body may be responsible for some malignancies.
5. As stated previously many compounds are able to induce tumors in organs remote from the site of application.
6. A single carcinogen may produce tumors in a number of different tissues. This is of considerable interest for it implies that a single causative agent may be responsible for a variety of tumors in a given species of animals.
7. Some compounds are regarded as possessing a certain degree of specificity. A few appear to be most active in the induction of tumors of the liver while others do not affect that organ.

The discovery of over 200 compounds capable of eliciting tumors in experimental animals shows clearly that it is unjustifiable to speak of the cause of cancer when referring to the etiology of this disease. There are probably a variety of causes of cancer just as there are a variety of cancers; and each type of cancer should be studied as a disease entity. Furthermore, tumors arising in the same organs of different species may be treat-

ed as separate diseases. There is a marked difference in the histologic appearance of mammary tumors in the rat and mouse and pulmonary tumors in the human and the mouse.

The availability of a large number of chemical carcinogens has given the investigator an opportunity to study their comparative carcinogenicity for different organs. In one such study⁶ thirteen compounds were examined for their ability to elicit tumors of the skin, subcutaneous tissues, and pulmonary tissues when injected beneath the skin, painted on the skin, or injected intravenously. Some compounds were more potent beneath the skin than upon the skin; some failed to induce tumors at the site of injection when injected subcutaneously but produced many pulmonary tumors; some produced tumors at the site of subcutaneous administration but failed to induce pulmonary tumors. Certain compounds were of high carcinogenicity for all tissues while others were weakly carcinogenic for all tissues. The dose administered, the route of injection, the solvent for the chemical, the strain and species of animals employed are all important factors in any study dealing with this phase of experimental cancer.

Another advantage obtained by the use of pure chemicals is the opportunity to perform quantitative experiments which are extremely important in biologic investigations. Efforts have been made to compare the carcinogenic activity of different compounds, but most of these have been performed by comparing the results obtained when a single dose of the carcinogens was injected. More thorough studies along quantitative lines are almost certain to lead to important findings. Emphasis should be placed upon obtaining more knowledge of the many available compounds.

Recent Work On Virus-induced Tumors

This trend in cancer research has been ably presented by Andrews⁷ and Rous.²⁰ The virus etiology of certain tumors in experimental animals has been generally accepted, but most investigators hold the view that so far as the causative agents of cancer are concerned the viruses represent only one of a number of etiologic factors. It is highly improbable that all types of neoplastic growths in all species are due to the activity of viruses. The foregoing discussion of the chemical carcinogens indicates that many tu-

mors may owe their origin to pure chemical substances which are incapable of reproducing themselves. In the final analysis any definition of a virus should include self-propagation.

Since this lecture deals with recent observations no effort is made to review this interesting trend which has been making progress for many years. Two of the most recent and interesting investigations will be discussed.

The first is the work of Beard⁸ and his associates at Duke University in connection with the virus of infectious papillomatosis in rabbits. This virus is easily detectable in the naturally occurring growths in cottontail rabbits but is seldom found in growth produced by infecting domestic rabbits. These workers attempted to ascertain why the virus is absent in the lesions of the domestic rabbit. They found that the virus is probably destroyed by an enzyme which is present in the tissues of the domestic but not in the cottontail rabbits. The implication of this observation is that a similar mechanism may be operating in the tumors of other species which may account for the inability of investigators to demonstrate the presence of infectious agents by the ordinary methods of transmission. A virus can disappear from the lesion after it has initiated changes which eventuate into malignancy.

The second recent contribution in this field was made by Duran-Reynals.¹³ His investigations were carried out with the well-known virus tumor of chickens. Time does not permit a detailed discussion of this valuable contribution and only a brief summary of the findings will be presented. Duran-Reynals found that the chicken virus was infective for newly hatched ducks and produced two types of lesions which he designated as immediate and late. The immediate lesions occurred within the ducks within 30 days after inoculation and could not be propagated in ducks but could readily be brought back to the chicken where it reproduced the typical chicken tumor. The late lesions, however, were found in ducks several months after inoculation and consisted of different types of tumors. These tumors could not be brought back to adult chickens but were readily transmitted to ducks. Thus, the variability of a tumor-inducing virus was established. Other series of experiments were performed which further demonstrated the extreme variability of the virus.

Duran-Reynals states that "the ease with

which, starting from the Rous virus, so many different strains of tumors have been obtained in ducks and chickens * * * weakens the objection often heard against the virus theory of cancer; namely, that one would be obliged to suppose that there is a different causative virus for every different type of tumor."

Only four definite trends in cancer research have been discussed, although it is recognized that others are of equal importance. The definition of trend as presented in the first part of this lecture precludes the mention of the work of any single investigator or any group of workers who may be interested in other important phases of experimental cancer. A development in cancer research is regarded as a definite trend when it is accepted as such and pursued in laboratories throughout the world.

Objections may be raised to the term "recent trends" applied to the subject matter of this lecture since some of the results were reported over ten years ago. It is essential to note that, as a rule, the most important advances in our knowledge of cancer have been the results of years of intensive effort by experienced investigators which indicates that in the study of the disease a period of ten years may be regarded as essential for the establishment of any definite trend.

THE EVOLUTION OF MEDICAL PRACTICE

W. H. VALENTINE, M.D., F.A.C.S.

Tracy, Minnesota

I HAVE enjoyed and feel very deeply the honor the Southern Minnesota Medical Association has conferred upon me in making me its president for the past year. This is a society of rural practitioners, men of outstanding reputation in their own communities, generally known for their honesty, integrity, and professional ability. We should not be forgetful, however, of the fact that there is a generous sprinkling in this group of specialists who are well known not only in the United States but in the balance of the world as well. This mingling of general practitioners and specialists has brought about a very high type of medical practice in Southern Minnesota. It is an honor to me to be counted with these men of worth-while achievements and fine reputation.

The general practitioner gets closer to the hearts and lives of human beings than anyone else on earth. It is to him they go with all their troubles and sufferings; it is he who knows their weaknesses and strong points, their family characteristics and individual traits; and it is the family physician who successfully meets their mental kinks of whatever nature they may be. In special cases, where he has exhausted his professional facilities or ability, he refers the patient to a specialist, who, in his judgment, will give the most satisfactory care.

Since the beginning of time there has been disease and suffering and in the dawn of humanity disease was looked upon as evidence of displeasure of the Gods. In these early days the physician and spiritual adviser were very closely associated in the minds of the people and the spiritual adviser was often the one sought in time of ill-

ness. All kinds of fantastic sacrifices were made to appease this so-called anger of the Gods, such as the women of India throwing their babies into the Ganges river. We find even in Biblical times the reference to driving the demons of the insane from the people into the swine, and the swine rushing into the sea and being drowned.

May I call your attention to the fact that there still exists in the minds of not a few people the idea that some forms of sickness, especially the mental, have something to do with the unseen and the uncanny. Take, for instance, two persons who are sent to Rochester. One of them is sent on to the State Hospital for the mentally ill and the other to a surgical institution. After they both return home, the one who has been at the State Hospital does not himself, nor do his friends, refer to his Rochester trip. But the one who has had an operation is pleased to recite all the details at the club, at tea, or elsewhere. This is evidence of the hangover of the old mystery in medicine.

Then we have the magic, the contact with certain things or objects which are supposed to eradicate the suffering of the human being. There is not a professional man here tonight who has not had a man come into his office with a copper wire around his wrist to cure his rheumatism, or a stolen potato placed in his pocket to become hard with dehydration signifying the hardness being taken out of his joints.

All superstitions originated in the minds of primitive peoples, lacking any great amount of intelligence and practically illiterate, yet these superstitions have been blindly followed by men for centuries, most of whom enjoyed some degree

of education. It is today more difficult to eradicate from intelligent and educated persons these absurd fallacies than it is to alter the erratic behavior of the insane. And, strange as it may seem, the doctor, in his efforts to aid mankind, finds superstitions one of the greatest handicaps when dealing with the sick. Friday is not unlucky because Christ died on that day; lemon juice will not remove freckles; handling toads does not cause warts; rubbing the warts with pork fat and burying the fat beneath a manure pile will not cure warts; the fact one is hungry does not mean he has a tapeworm. The old idea that human or animal urine had some certain healing qualities is not confirmed but is interesting when we consider that urine has been found to contain certain hormones.

I remember very well a man considerably older than myself who, when he was a boy, went to Dr. W. W. Mayo. At the time the young man was suffering from shingles. He said, "I understand if these go clear around me it will kill me." Dr. Mayo replied, "My boy, they will if they go clear around, but they'll not go clear around." We all know whiskey doesn't cure snake bites, and sulfur and molasses, or bicarbonate of soda, do not make the best spring tonics. Neither will bags of sulfur and asafoetida, making the wearer smell like a tame polecat, keep away disease.

Fruits and seeds do not give us appendicitis. Cancer and tuberculosis are not inherited. Boils do not cleanse the system. Milk from the mother's breast squirted into the baby's sore eye is decidedly harmful to the eye and not beneficial. The hair of a mad dog rubbed into the wound will not cure hydrophobia. Yet we have intelligent well educated people today who will go to irregular practitioners of the art of healing in the expectation that the laying on of hands is going to cause marvelous and permanent cures in incurable diseases. This, of course, is another visible evidence of the weakness of the human race.

While medicine is as old as humanity and probably 5000 years ago there were many skillful things done in the treatment of bones, the trephining of the skull, and even herniotomies, the real medicine of today is a comparatively new art. Even we doctors are startled when we realize that within the last 75 years the principal achievements of medicine have been attained. Entering the three principal cavities of the body—the head, the chest, and the abdomen—and the

seeming impossibility of opening joints, were all made possible by two outstanding discoveries.

The first of these was the first use in 1846 of ether as a general anesthesia which enabled the surgeon to go about his work with deliberation and freedom of anxiety for the patient's suffering. Then the work of Pasteur and Koch brought out the relation of bacteria to infection which was fundamental to surgery and made it possible to have the highly perfected aseptic surgery we know today. It is within the memory of this society when laudible pus was looked for. Further, I remember very well Dr. H. M. Workman telling of spraying the operating room with phenol to kill the germs so he might eliminate the possibility of infection.

All this has brought about, in my estimation, the foundation for a most excellent type of modern surgical technique. Our modern hospital has a trained personnel, skilled nurses, elaborate laboratory facilities, and almost perfect x-ray apparatus. The discovery of x-ray is within the memory of the writer. One of the teachers came to me all excited one morning and said, "You know, they have a machine now that will take a picture of your bones while you are still alive!" Results from surgical procedure have become so satisfactory that when occasionally a patient dies following an operation the public asks, apparently very innocently, "What went wrong?" It does not seem possible to them that death could be caused by anything other than some surgical mishap.

Medicine, surgery, and hospitals grew up first in our large cities, but now in our small country towns we are finding well-equipped hospitals. These hospitals have a large investment and the attending doctors have contributed much time and money and are looking for returns. This equipment which does such wonders may at times cause some to be overzealous or not too conscientious so that operations may be done which are not absolutely necessary. The old saw about whether the surgeon operated for appendicitis or \$150.00 sometimes may be nearer the truth than we would like it to be.

With the pyramiding of financial investments, time and study necessary for a doctor's degree, there has been an accompanying increase in the cost of hospitalization and fees for the physician and surgeon. The lengthening out of the training period of the physician and surgeon has caused a certain amount of weeding out of the poor boy

who frequently looked upon the profession of medicine as his life's calling and has put this profession more or less in the hands of children whose parents are rather well off. This later class has never developed a sympathetic contact with the masses.

After having gone through this strenuous training to bring about the much desired dream of "Doctor of Medicine" the individual sometimes forgets the ideal that has been held out before medicine for many, many years—that of the patient first and the alleviation of human suffering. I fear sometimes the doctor feels he has invested a lot and must be paid for time and expense. This same condition may arise in our modern hospitals where expenses have become higher and higher each year.

Unusually high doctor bills and unusually high hospital costs have, in my judgment, been one of the causes of the so-called call for socialized medicine. We physicians sometimes, perhaps, have been guilty of being too conservative and inclined to feel that the practices of the past should be good enough for the present and also the future, and have not been willing to readjust many of our past practices to meet with the necessities of a changing civilization.

After all is said and done we must realize that of all the babies born in the United States, 50 per cent come into the homes of those whose earning capacity is less than \$1,000; may I repeat, 50 per cent of all babies born enter the homes of indigents or those individuals whose earning capacity is less than \$1,000 yearly.

I recently referred the small son of a school teacher whose earning capacity is approximately \$1,400 per year to one of our larger hospitals for a laparotomy. The first week's hospital bill on this patient was \$94.60; the next week's, \$73.80; and the surgeon's fee was \$200.00. In other words, for the two weeks' stay in the hospital this family paid out one-fourth of a year's gross earnings—more than 3 years' net earnings. This condition has made it possible for the news-monger to find fault with our medical practice.

It has become a popular thing to criticize medicine not only by the Bernard McFadden type of cheap publication, but in the August number of the *Kiwanis Magazine* there appears an article by the editor in which he stresses the fact that our people are not being taken care of as they

should be. In this article he states that in a certain town there were thirteen unnecessary deaths in one year due to the lack of hospital facilities—this in spite of the fact there was a modern hospital within twenty-one miles on a paved highway, a distance not much greater than that traveled in many larger cities by ambulance.

Statements of this kind for lay consumption in this magazine, in my judgment, should not be allowed to go unchallenged. I, therefore, took it up with the editor and he referred me to the physician who was in charge of this hospital which is located in the hinterlands of Missouri. These people are ignorant, superstitious, and very poor. The doctor in charge writes me as follows: "The people who died in my community while I looked on and counted them did not do so because we failed to urge hospitalization but because the individual or people responsible for him could not bring himself to meet the situation. It is our thesis that if hospitalization is stripped of the non-essentials and the hospital located close to the rural individual so that he will be acquainted with it he will make use of the hospital. Moreover, experience has shown us that he can pay his own bill and not become a ward of society on a general scale."

"Our contention here is that the community more often has wanted to dump the medical problem in the lap of the doctors and with great moral emphasis accuse the doctors if they fail to assume the whole responsibility for the arranging of the financial obligation incurred. It seems to me that the mass result of this situation has been for the doctor to find himself finally unable to assume the responsibility as it is offered to him, so that the public has howled to the government to do something about it. Our deepest sympathy is with the public, but we believe it is a spoiled child."

The *Atlantic Monthly*, which we will all grant is a high type magazine, had an article in the April number a few years ago by some unknown writer who was a college graduate. She displays many queer psychological quirks in her article entitled, "I Had a Baby." She raves on about the high cost of this procedure. At the same time she honestly admits she obtained the services of one of the most expensive obstetricians in New York City and had everything the hospital could offer; then strenuously objects to what it cost her. This is like going to an expensive hotel and after-

wards figuring you could have had lodging cheaper elsewhere.

She criticizes everybody in the medical profession and finally decided to go to Switzerland to have her next baby because she said the doctor insisted on her taking an anesthetic. Now, truly, lay readers would think from this article people are being grossly overcharged.

However, in the June *Atlantic Monthly* there appears a symposium in which three level headed women go on to state they had their babies in American hospitals, had fine service, everything was satisfactory, and they were allowed many chances to have what they wanted—for instance, could have an anesthetic or not just as they liked.

In last Sunday's issue of one of our prominent religious papers we find the heading "A Woman Complains About Doctor's Fees" calling the reader's attention to how reasonably our grandmothers received obstetrical care in the past, yet now with more doctors and cars, good roads, they have to sell two of their herd of ten cows to pay for the youngest baby and still don't have enough money. The editor very thoughtfully remarks that the doctor with his modern education and facilities, the hospital with its full equipment are offering their obstetrical services for a very reasonable amount. As stated by the editor, it is not uncommon for all prenatal, delivery, postnatal care, and hospital fees to be furnished for \$50.00.

We are surprised to find in the *Atlantic Monthly* of some time ago an article by Dr. Henry E. Segerist of the Institute of History of Medicine at Johns Hopkins in which he criticizes the practice of medicine in the United States. He names a lot of countries in Europe and tells how much better medicine is handled there. He states among other things that more than 40,000,000 of our population have an income of less than \$800 a year; that the other third does not have \$1500 a year. He further states that in millions of families whose income is more than \$1500, medical care presents a most serious problem.

He goes on with a great deal of statistical freedom showing how people die of tuberculosis, cancer and heart disease and would leave the reader to believe, or reach the conclusion at least, that if we had social medicine all these people would have lived which, of course, is the farthest thing from the truth. After reading the article, if one believes everything said, he will believe we are having hundreds of unnecessary deaths from the inefficiency of the present medical setup.

Beverly Smith, writing in the *Readers' Digest* under the heading of "Diagnosing the Doctors," goes on with very startling figures that would send a cold chill into the heart of any individual. She states that 7,000 women die in childbirth every year; 70,000 children die in the first year; 20,000 die of pneumonia, etc.; that there are about 600 needless deaths each day, supposedly proving that if we had doctors working on a salary these deaths would not have occurred. She infers that all the doctor of today is after is money. She says that if a judge could decide a case one way and get \$5000 or decide it the other way and get nothing which way, she asks, would he naturally decide? She quotes our good friend Richard Cabot as being in favor of salaried physicians. Incidentally, I happen to know Dr. Cabot, as you probably do also, and I know he had a wife with a million in her own name which might help out his salary.

This country has developed over the last three centuries from a sparsely inhabited strip along the Atlantic seaboard to a teeming nation of 130,000,000 souls spread across this vast continent. We have been born with gold spoons in our mouths, pampered until we are not willing to put up with anything that does not conform to our own narrow beliefs. Imagine a nation with only 6 per cent of the world's area and 7 per cent of its population owning 33 per cent of its railroads, using 48 per cent of its coffee, 56 per cent of its rubber, owning 60 per cent of its telephone and telegraph lines, consuming 70 per cent of its oil, 72 per cent of its silk, using 80 per cent of its motor cars, having one-half of its monetary supply, fifteen billions in gold, and two-thirds of its banking resources, and yet, due to obvious maladjustments, discontented and, in many quarters, bitter.

Discontented ourselves, we have in turn become the cause of discontentment elsewhere. Not so long ago the Brazilian Ambassador ascribed the growth of fascism in his country largely to the bitterness engendered there by the fact that American labor had twenty times the income of Brazilian labor. Discontented ourselves, we are of all nations the most envied. All too many of us have very little real conception of the nature of liberty. We like to declaim about "our ancient liberties," and fail to remember that liberty, in its higher aspects at least, is not an inheritance to be handed down by operation of law from generation to generation.

We fail to realize that liberty is something that must be positively and aggressively achieved by each successive generation or else be lost to that generation, and probably to its successors. One of the great grounds of discontent today is that liberty, freedom, and civilization are not automatic. We resent the fact that we, like our forefathers, must fight in our day for freedom. Is it not obvious that what is most needed today in this enormously rich but very discontented country of ours is a clearer perspective on life as a whole? True, there are doubtless many things that need correction, medicine as well as everything else. Manifestly, the millenium cannot be reached overnight. Perfection is not to be attained by legislation. What is needed now, above all things, is unselfish, enlightened civic leadership.

The present discontent with the medical profession is just one of the many outbursts of discontent in many different walks of life. But medicine seems more vulnerable to the attacks of the agitator because within its folds we can find a great deal of sentiment which has within itself the possibilities of very lasting appeal.

The physician—first on horseback, then with his horse and buggy, more recently with his automobile, and now occasionally, in emergencies, with his airplane—has placed his skill and his devotion to duty at the service of his community. Suffice it to say that our nation and our time has been better served by its physicians than has any other nation at any other time.

In 1901 the expectation of life at birth in the country was 49.24 years. By 1941 it had advanced to 63.42 years. In short, every citizen owes at least one-fifth of his years of expectancy of life to the advances of medical science in the last half century, not to mention a much more comfortable living throughout his whole span of life. Here is a record that one would think would have endeared the medical profession to every sane person. Yet a small minority are bitterly misrepresenting and fighting us.

"Illness is a hazard of such unpredictable incidence that it cannot be budgeted in advance like most of the necessities of life. It is more disastrous than other hazards because it imposes a double penalty. It deprives the wage earner, at least, of income just when it is most needed to meet the costs of medical care. It is to meet the needs of this great middle class that cost-sharing methods have been devised."

Workmen's compensation is not only a return of a part of the salary to the disabled worker but also pays for his medical care and hospitalization. It does not extend to the care of the family when they are ill. Unemployment insurance does not cover medical care. Unemployment from the lack of a job, and unemployment due to the fact the individual is laid up from illness are much the same, so we might have unemployment cover not only loss of wages due to failure to find employment but also due to the failure of employment brought about by illness.

Writers seem to have run away with the idea that services rendered by the general practitioner are of little or no value. We must have groups of specialists in order to take care of ordinary sicknesses. As a matter of fact, in my judgment, the group is not as capable of taking care of ordinary illness as is the general practitioner. The individual who is coming down with an acute attack of influenza does not need the services of an eye, ear, nose, or throat specialist nor a brain surgeon. If we are going to insist that everybody is going to be taken care of by a group of men who are trained in specialties it is necessarily going to double or triple the medical cost of any trivial illness.

Group medicine is only necessary in cases that are especially selected by the general practitioner which he cannot take care of for one of two reasons: (1) he does not have the special equipment to make the necessary diagnosis or administer treatment; or (2) the condition is so rare that only a few men after long study are able to make diagnosis and give treatment.

We should not be too greatly shocked by the fact that a great deal of sickness is now being delegated to governmental control. We have already, and I think all believe satisfactorily so, allowed the State Board of Health to look after contagion, the County Board to care for our tuberculous patients, and the State Board of Control to care for the insane, and crippled and deformed. During the passing years there has been a gradual extension of federal agency into health activities; the United States Health Service is in the Department of the Treasury; foods and drugs in the Department of Agriculture; maternal and child welfare in the Department of Labor; the care of Indians and insane in the Department of Interior; the Medical Corps of the Army and Navy with their own establishment; the care of the veterans in the Veterans' Admin-

istration; the care of the indigent farmers in the Resettlement Administration; and so on through twenty-seven different federal agencies involving an expenditure of approximately \$600,000,000 a year.

The exponents and agitators of State Medicine have charged that the medical profession is static and obstructive, but without any compulsion from political or government sources the profession has sought constantly to advance the standards of medical education, medical licensure and hospital practice, and is now making a notable progress in the certification of specialists. Medicine has always been its own most severe critic and has done everything possible to raise the standard of medical practice.

A Municipal Employees' Health Service System was tried in San Francisco. This service was started some years ago and its success thus far had been due to the coöperation of the medical society and its members in the face of constant difficulties. In March 1941 the physicians reported feeling the crack of the politician's whip with the result that hundreds resigned in protest. The actions of the lay board seemed to be the foundation of the whole trouble; when the board was called together to consider the trouble only three of the eight directors met. It is the old story of lay people who know nothing about medicine attempting to dictate to medical men.

In a recent survey made by the American Medical Association, one-fourth of the physicians in active practice in Minnesota reported having given free care to 101,525 patients. Assuming the balance of the 3,302 physicians in the State gave an equal amount of free service, 10 per cent of the total population would have received care without paying. Who knows of anyone who is seriously ill and has no physician in attendance or cannot obtain the services of a reputable man?

There is a marked tendency to paternalism in government. Children's play must be supervised, tennis courts must be marked for them; young

people are unable to entertain themselves individually without some outside aid to give them the desired thrill. Boys and girls when they reach maturity expect some unseen hand in the form of government supervision to take care of their illnesses, give them a good job, and a good home.

During the present emergency we are becoming more aware of the privilege of living in a democracy and become much concerned when we realize there are but two great democracies left. We know that since the beginning of recorded history the masses have struggled for the right to live as free people. During the first third of the present century a larger share of the human race enjoyed freedom than in any previous period of history. Today we find progress has been reversed—more people have been subjugated during the past two years than during any similar period in history.

We are increasingly aware of the fact that we must be on guard if we are to preserve our democratic way of life. During the past, people have thought in terms of the privileges which democracy offers. If democracy is to be preserved we need to gain a greater appreciation of what democracy really is, how it may be improved, and how we may better serve this society in which we live. We need to become aware of the fact that if we are to have privileges we must also assume responsibilities.

Will organized medicine, by offering coöperation, aid in the development of a comprehensive plan of medical service, or will it wait until some system is imposed upon it where the effects can only be removed by years of continuous struggle?

Knowing the medical profession as I do, I have faith to believe that it will arise to this emergency as it has done in the past, and carry on successfully with honor to our beloved profession.

SHARK LIVERS PROMISE NEW VITAMIN SUPPLY

There will be plenty of vitamins for babies in Australia even if the reported mass drive to the altar by American soldiers and Aussie lasses causes a sharp uptrend in the continent's birth rate.

The Australian News and Information Bureau reports that a new process discovered by an Australian firm will guarantee ample supplies of shark liver oil, rich in vitamins needed by infants.

Eighteen months ago when vitamin oil imports from Newfoundland and Great Britain were plentiful, the shark livers were discarded. Today they are the center of a new industry promising to keep infants healthy and fishermen employed. Fish liver oils are rich in vitamins A and D.—*Science News Letter*, April 11, 1942.

PROGNOSIS IN HEART DISEASE: CONTRIBUTIONS OF THE ELECTROCARDIOGRAM

JOSEPH F. BORG, M.D.
Saint Paul, Minnesota

THE past decade has seen the development of a vast fund of information concerning the electrocardiogram. Unfortunately the dissemination of this knowledge proceeds all too slowly, and, as in many other fields, its use by the profession lags by many years behind its discovery. Thus it is a matter of importance to occasionally review the rapidly accumulating information available for study and to ascertain what practical use can be made of it.

Much attention has been paid to the electrocardiographic findings which aid in the diagnosis of heart disease. Hand in hand with these are to be found many observations which have great value prognostically in the study of the heart patient. Experience teaches that one must always be guarded in the expression of prognosis, a hazardous matter at best, but electrocardiographic findings will often enable the inquiring physician to evaluate more accurately the risk the patient is carrying and to forecast a course of events otherwise unsuspected.

The electrocardiogram may offer information of prognostic value in two general ways. First, the findings noted in the record will often reveal much more accurately the nature of the underlying heart condition, and the elimination of any doubt in this respect will enable one to assuredly express that prognosis which clinical knowledge has already made available to us. For example, an exact diagnosis of a cardiac rhythm disturbance enables the physician to obtain a much better concept of the gravity of the underlying condition and may give valuable warning as to the future course of the disease. Also, we have come to learn much of prognostic value from the recognition of certain changes in wave conformation, voltage, and lead combinations. Observations of these findings and certain combinations of them which may be considered as syndromes of electrocardiographic changes have come to be recognized as important, not only from the standpoint of diagnosis but also from that of prognosis. The purpose of this report is to discuss the importance of these considerations as a

guide to the knowledge of what the future holds for the heart patient.

A bradycardia above fifty per minute is usually of no significance but occasionally there is found an unsuspected complete heart block with its attendant significance. Below fifty per minute it may be of no significance, but more often it is found due to auriculoventricular block, nodal or other abnormal rhythm, or toxic disturbances. Here the prognosis is that of the underlying condition which often depends on the electrocardiogram for recognition.

Sinus arrhythmia is not associated with heart disease but may be so marked as to suggest the possibility of a more serious type of disturbance such as auricular fibrillation. Here the electrocardiogram is necessary to determine its nature and avoid the more serious prognosis which attends an inaccurate diagnosis. In acute infections this type of rhythm usually disappears with an elevation of the pulse rate. It has been observed that in such conditions where the sinus arrhythmia returns during convalescence, the myocardium has probably escaped injury.

The determination of exact information concerning premature contractions can be of great importance in informing the physician concerning the gravity of a particular situation. These common arrhythmias are usually ventricular in origin and often of no significance clinically. When they occur in regular sequence, such as in pulsus bigeminus or trigeminus, they are usually indicative of heart disease when digitalis toxicity can be excluded. Occasionally they may be accompanied by a tendency to ventricular tachycardia and at times to ventricular fibrillation, usually fatal. Where the premature contractions are auricular in origin, they are frequently precursors of auricular fibrillation, definitely of more serious prognostic import. When they are found to be of multiple foci of origin, ventricular, auricular, nodal, or combinations, the underlying condition is an irritable myocardium often associated with a myocardial damage of seriousness otherwise unsuspected. Where numerous premature contractions are associated with arteriosclerotic heart disease, the progressiveness of

Presidential address, read at the annual meeting of the Ramsey County Medical Society, Saint Paul, January 26, 1942.

the latter is emphasized and points to a much more ominous situation than where the condition is stationary.

Paroxysmal tachycardia are common disturbances of rhythm which originate in the auricles or ventricles, in the ratio of about four to one. The immediate outlook as regards the paroxysm is good regardless of the rate, duration, or apparent illness except (1) in the ventricular type which may switch to the fatal ventricular fibrillation, (2) when associated with a failing heart where fatigue may cause a fatal outcome and (3) when found in association with acute myocardial infarction, where the ventricular type is often found and where it may produce congestive heart failure. In these a guarded expression of future possibilities is the wise course to take.

Campbell and Elliot² found that 55 per cent of paroxysmal tachycardia problems are found in normal hearts, 19 per cent in rheumatic heart disease, 20 per cent in hypertension and coronary heart disease, and the rest scattered. In the normal hearts the attacks seemed to have no significance prognostically. In the rheumatic group they did not seem to influence the length of life. In hypertension and coronary heart disease one-half the patients died between five and ten years after first seen. When paroxysmal tachycardia is nodal in type, it usually has the significance of the auricular type, many of which are not associated with organic heart disease, being of vagal origin and being reversed by atropin administration. Where such reversion does not occur, the disturbance is probably associated with myocardial disease.

Auricular fibrillation is usually, but not always, diagnosed without the aid of the electrocardiogram and in itself has certain prognostic significance. If found without other evidence of heart disease, it is usually transient and the prognosis good. Where other indications point to heart disease the presence of auricular fibrillation indicates important damage. It may suddenly appear in the course of acute myocardial infarction and indicate grave danger. Embolic complications may cause sudden death. However, it is hazardous to attempt to estimate the duration of life following its onset. The majority of patients die within ten years of progressive myocardial damage. It has been pointed out that auricular fibrillation, complicated by ventricular premature contractions, is accom-

panied by a definitely more serious prognosis. DeGraff and Lingg⁴ showed that in rheumatic heart disease where auricular fibrillation set in before the age of twenty, the expectancy of life was less than one year. In older age groups this is not true, other factors being more important in determining the outlook.

Axis deviation in itself is usually not of great significance, but where recognized heart disease exists, it is indicative of a greater strain on the heart. Thus, right axis deviation in mitral rheumatic heart disease lessens life expectancy as does also left axis deviation in diseases causing an enlargement of the left ventricle.

The presence of right axis deviation associated with myocardial infarction is usually an index of a severely damaged left ventricular myocardium, often associated with extensive destruction.

Masters¹² has presented a prognostic study of right axis deviation in 173 patients over a period of four years. Fifty-seven percent of these had chronic valvular disease, of whom 28 per cent died, the poorest prognosis being among those who showed inversion of T waves in leads one and two. Twenty-one per cent of this group had degenerative heart disease, of whom 7 per cent died, all of whom had wave changes in leads two and three. Of all types, 21 per cent were dead in four years, and where associated with auricular fibrillation 33 per cent were dead in that time.

Klainer¹⁰ found in a study of arteriosclerotic and hypertensive heart disease that right axis deviation was often associated with recent myocardial infarction and that 43 per cent were dead in one month after discovery. He also found that 83 per cent were dead twenty-seven months after the condition was discovered and that the average duration of life was seventy-six months.

Many electrocardiographic changes add nothing to exact clinical diagnosis of etiology in heart disease, but they have been found to contribute to the understanding of the gravity of a situation and thus to prognosis. T wave negativity, various grades of heart block, low voltage, pulsus alternans, and changing serial records are among these changes.

T wave negativity has been well studied by many observers. Willius¹⁶ showed that in patients with heart disease, those having T wave changes had only about half the life expectancy of those without them. Of 200 cases of rheumatic aortic insufficiency without T changes, 39 per cent were dead in sixteen months, while in

sixty-two cases with T changes, 56 per cent were dead in four months. Of 137 cases of syphilitic aortic insufficiency without T changes, 46 per cent were dead in sixteen months, while of forty-two cases with T changes, 76 per cent were dead in eleven months. Of 272 cases of coronary disease with T wave negativity, 67 per cent were dead in seventeen months. This experience was similar in hypertensive heart disease. In both types of degenerative heart disease the more T waves are inverted, the poorer the outlook.

While the findings indicate that T wave changes are significant of serious heart disease, it must be emphasized that such mortality experiences may be materially altered by the more meticulous care with continued observation which should be given to patients with significantly serious electrocardiographic findings. In the hands of many physicians, therefore, this mortality may be considerably lower.

Conduction defects in the absence of toxic etiology are nearly always due to serious heart disease. They are usually unfavorable signs. Their prognosis depends on their severity, their duration, and their tendency to progress over a period of time, but an important determinant, also, is the nature of the underlying heart condition. In the severer grades of disease there is danger of cardiac standstill (Adams-Stokes Syndrome), unpredictable and often fatal. Most individuals with these grades of severity live less than two years from the time of their discovery. In acute infections, as diphtheria, these defects are signs of cardiac involvement, toxic or inflammatory. They are dangerous during the acute condition, but usually heal completely and leave no disability.

Intra-auricular block as seen in wide, notched, all P waves is due to myocardial disease importantly involving the auricles. In itself it has no independent prognostic importance save that it is frequently the precursor of auricular fibrillation.

Auriculoventricular block is always a serious condition warranting a guarded prognosis. The prognosis is that of the etiologic factor in addition to the inherent danger of sudden, unexpected death, associated at times with shifts in the grade of block, due to ventricular standstill. In coronary disease the outlook is poor.¹¹ In acute myocardial infarction it is a very ominous sign, five patients out of thirteen in one series⁹ having died. In luetic or rheumatic heart disease the

prognosis, although guarded, is less serious and patients may carry on for long periods. While auriculoventricular block occurs too infrequently for statistical analysis, it must always be considered a serious sign and a guarded prognosis maintained.

The third important type of block is intra-ventricular or bundle branch block, by far the most common. Here considerable light has been thrown on the prognosis through a number of studies. This type of block may be roughly divided into five groups, the common, uncommon, concordant, S and miscellaneous types. While most investigators have been unwilling to attribute any difference prognostically to the individual groups, recent work has shown that at least two types have quite different prognoses than the others. Willius⁵ has shown the S type to have much better prognosis than the more common types. Also, it is becoming known that an unusual type in the miscellaneous group must be recognized and separated as one which is not apparently due to heart disease, a type associated with a short P-R interval and attacks of paroxysmal tachycardias.

However, it must be recognized that the great majority of cases fall in groups which have similar significance prognostically. Sampson¹⁴ made a study of 112 cases of bundle branch block. He found that at the time of discovery of the lesion a patient has a 20 per cent chance of surviving eleven years. If he survives three years, he has a 44 per cent chance of surviving eight years. In the common type of bundle branch block there is a higher mortality than in the uncommon and miscellaneous types. In the patient with a changing electrocardiogram there is a definitely poorer outlook than where the record is stationary. The highest mortality is always found in the first year.

Comeau³ and his associates in discussing transient bundle branch block point out that it is usually associated with coronary sclerosis, the outlook depending on the progress of the disease which is determined by the clinical picture as well as a changing fundamental electrocardiogram.

Bishop and Carden¹ studied the prognosis in bundle branch block in a series of fifty cases. They point out that it is the same in complete as in incomplete block. They found the mortality to be highest in the first few years after discovery. Thirty per cent died in the first year, 15 per

cent in the second year, 10 per cent in the third year, and eight per cent in the fourth year. With each year of survival beyond the fourth the expectancy of life increased. Five patients of their series were alive after a known duration of eighteen to twenty years of intraventricular block.

Kaplan and Katz⁷ state that 60 per cent of the patients who die with intraventricular block are dead within two years. Of these 80 per cent died during the first year (27 per cent in the first three months), and 90 per cent during the first two years. Forty per cent of their series were alive two to eight years after discovery of the block. They conclude that if the patient survives the first year after discovery of the block, the prognosis is good.

Master, et al.¹³ have shown the seriousness of bundle branch block in acute myocardial infarction. In his series there was a mortality of 43 per cent, almost double that found where normal conduction occurred. In these deaths autopsy always showed previous closure of one or more branches of the coronary arteries. The outlook was not related to the type of bundle branch block which was found. An increase in mortality occurred where QRS was greater than .14 seconds, and most of the deaths were associated with myocardial failure. Also, the danger of ventricular fibrillation is increased by the presence of intraventricular block in cases where digitalis leads to ventricular extrasystoles.

In general, it should be emphasized that studies of bundle branch block can give much information concerning the prognosis of heart disease in which it is found. This is especially true if care is taken to classify this conduction defect since certain types have quite a different mortality than others. Early after the recognition of the defect it is hardest to derive information as to prognosis, but since the first year mortality is always high, patients surviving this period have a relatively good outlook, their condition frequently remaining fairly stationary and amenable to clinical control.

Alternation of the heart is an infrequent form of heart block recognized as pulsus alternans or electrical alternans. It is a condition in which a local region in the heart is partially or completely blocked out with every beat.⁸ It may be transient, recurrent, or temporary. Prognostically, when associated with tachycardia, it is of no significance, but when occurring at slow rates it is in-

dicative of organic heart disease, especially coronary sclerosis. Infrequently the types of alternans occur together. More often one or the other may occur. They have the same significance prognostically, and where the alternans persist, the patients usually do not live more than a year or two.

Low voltage has long been considered to be associated with serious myocardial damage. This is measured by the greatest deflection of the QRS complex in the standard leads and is regarded as existing where the highest QRS deflection is five millimeters or less in each of the limb leads or where it is somewhat taller than five millimeters in one lead with the sum of all amplitudes less than 15 millimeters. It may or may not be associated with low voltage in the chest leads. Many conditions amenable to treatment such as hypothyroidism, myocarditis, pericardial effusion, etc., may produce low voltage in addition to coronary disease patients which comprises the largest groups. It is, therefore, important to arrive at a correct clinical diagnosis before attempting to read significance into the electrocardiographic finding of low voltage.

Sprague and White¹⁵ studied fifty-seven cases of low voltage and found that they were usually associated with arteriosclerotic heart disease (thirty-four cases) or hypothyroidism (ten cases). Of the arteriosclerotic group only one-third were known to have been alive, and all of these were last contacted less than three years after the low voltage was found. Those who died had all lived less than two years after its discovery. Occasionally, but rarely in arteriosclerosis, the voltage may return to normal limits under therapy with a definite improvement in the outlook. This suggests an improvement in the myocardial blood supply associated with a compensating collateral circulation development.

The low voltage discussed has concerned the QRS deflection. This may or may not be associated with low T waves and is more significant where the T waves are low, less than two millimeters deflection in all limb leads. T waves are frequently low in one or two leads without significance. This is especially true in lead one associated with a low QRS complex. Such a finding is common in the vertical type heart and is of no clinical significance. Where R_I is high and T_I is low and where T is low in all leads, strong evidence of heart abnormality exists⁶. Knowledge concerning the prognostic significance of

these findings is not definite and must be obtained from knowledge of the clinical condition toward which the record is an aid in recognition.

The past decade has given the medical profession a new conception of the value of the electrocardiogram in conditions associated with changes in the myocardium, toxic or organic, transitory, progressive, or stationary. While much of the value is diagnostic, considerable of prognostic import is included and is especially provided by serial records at varying time intervals. Such records point out the evidence of toxicity due to digitalis medication and enable one to be on guard against symptoms which might be overlooked as being due to the medication. They are helpful also in showing the course of myocardial involvement in infectious disease, usually returning to normal during convalescence. The delay of such a return or failure to appear may be the only evidence pointing to continued or progressive myocardial damage which impairs the outlook for recovery.

The greatest value of the electrocardiogram is in the management of coronary heart disease. Here serial records cannot be overemphasized in the importance of their contribution to prognosis. Normally the tracings are characteristically stationary for an individual and deviations from the normal are indicative of myocardial change. In coronary disease these changes are especially helpful in giving information concerning the myocardial involvement. Often coronary disease produces a myocardial effect which becomes stationary at some point, this being demonstrated by the fact that the electrocardiogram shows no change in serial records. In other instances the progressive narrowing of the coronary arteries causes progressive myocardial changes which are reflected in the changing pattern of the electrocardiogram. These changes point prognostically to a serious type of heart disease with a definitely limited life expectancy. They may develop into some of the types previously discussed which in themselves have certain prognostic significance as shown from statistical analysis. Then again they may become stationary at any point as the process ceases to progress. Finally, though not usually, they may show a definitely improved outlook as a collateral circulation develops, especially under conditions of a long period of rest and restricted activity.

In acute myocardial infarction the serial electrocardiograms are of greatest importance in management of the disease. Not only may the type of curve indicate the severity of the initial damage, but the rapidity with which the serial tracings tend to stabilize at their eventual contour is of great value in determining the length of time absolute rest is advisable. During this rest period, as well as in the later convalescence, many of the previously described ominous features of the record may be found and point to danger which should be recognized and which may at times be lessened by proper management.

In conclusion, it is hoped that a useful concept of the value of the electrocardiogram in prognosis has been presented and that its limitations have been properly stressed. Considering the electrocardiograph from this point of view only emphasizes the warning of Katz⁸ that it "is not a tool for the unscrupulous or a plaything for the erudite. . . . Its value depends as much on the ability and experience of the cardiographer as the results of clinical examination depend on the ability and experience of the clinician. . . . It is as much of an error to expect too much from this tool as to ignore the valuable information that it can give."

ECTOPIC PREGNANCY

An Analysis of 102 Consecutive Cases

WM. P. SADLER, M.D.†
Minneapolis, Minnesota

DURING the nine-year period, 1932 to 1940, 102 proved cases of ectopic pregnancy were admitted to the Minneapolis General Hospital. Data selected from these cases furnish the material for this study. Findings, in the main, conform to generally accepted concepts though they differ in some particulars. During this same period 7,720 patients were admitted to the gynecologic service, 15,223 to the obstetric service and 2,532 abortions were recorded. This totals 17,765 gravid women.

Our incidence is one ectopic pregnancy for approximately every seventy-six gynecologic cases, one for every twenty-five abortions and one for every 174 intrauterine pregnancies. Schuman estimated the incidence in the Philadelphia area as one to 303 uterine pregnancies.

A survey of the literature shows considerable variation in the total and operative mortality rates. Table I illustrates this more clearly.

In 588 cases including ours, the average total mortality is 5.4 per cent and the operative mortality 2.93 per cent. One hundred of our patients were operated upon with one death (1 per cent), which occurred seven days after operation. Autopsy revealed bilateral lobar pneumonia. Of the two non-operative deaths, one occurred en route to the operating room three hours after admission. Autopsy showed a ruptured cornual pregnancy with massive intraperitoneal hemorrhage. The other death was in a patient who had attempted to abort herself. She was diagnosed and treated by us as a septic self-induced abortion. She died fourteen days after admission. Autopsy showed infected tubal pregnancy with rupture into the ileum, *B. coli* septicemia and multiple lung abscesses. *B. Welchii* was cultured from the spleen.

Our favorably low total (2.94 per cent) and operative (1 per cent) mortality is especially noteworthy because of the large percentage of shock cases in this series. Twenty-eight patients (27.4 per cent) were admitted in varying grades of

TABLE I

Average operative mortality in 909 cases—2.93%

shock, three mild, seven moderate, ten severe and eight practically moribund. The average incidence of shock reported in the literature is approximately 15 per cent. Langman and Goldblatt had 15 per cent in their series; Ware and Winn, 17 per cent. These conform to the findings of others. Lavell's series showed an incidence of 21 per cent. Two factors contributed to our results. These were prompt surgical interference and the use of an available blood bank. Two moribund patients received 3,600 c.c. and 4,000 c.c. of blood by transfusion within a period of several hours.

That the diagnosis of ectopic pregnancy presents many difficulties may be seen in Table II.

Definite diagnosis was made in sixty-six of our cases, suspected in twenty and missed in sixteen. Cases in this series with the diagnosis "Probable ectopic pregnancy" and no other qualifying diagnosis were listed as suspected. More liberal interpretation of these would give us a correct diagnosis in 72.3 per cent. In the presence of shock, the diagnosis presented little difficulty. Of these, twenty-seven of the twenty-eight were correctly diagnosed. The one missed entered the hospital the day after she had

Thesis presented before the Minnesota Academy of Medicine, March 11, 1942.

From the Department of Gynecology, Minneapolis General Hospital.

visited a criminal abortionist and was admitted with a catheter in situ. Our diagnosis was ruptured uterus and peritonitis. Operation revealed a ruptured cornual pregnancy with massive intraperitoneal hemorrhage.

It is interesting that our percentage of correct diagnoses was practically the same as the general average of the 915 cases shown in table number two.

Race, Age, Marital State and Parity.—There were one hundred white women, one colored and one Mexican. The age ranged from eighteen to forty-three years. Two were eighteen, one forty-one and three forty-three. Twenty-one were between twenty to twenty-four years, thirty-six between twenty-five to twenty-nine years, twenty-nine between thirty and thirty-four years, ten between thirty-five and thirty-nine years. The decade of twenty-five to thirty-four years showed the largest number, sixty-five or 63.7 per cent. Eighty-eight of the patients were married, nine were single and five were divorcees. Incidence in relation to parity shows the largest group, twenty-five, had been pregnant once previously, and thirteen had never been pregnant. The number of pregnancies ranged from two to eleven in the remaining sixty-four patients. Five patients in this group had been operated upon for ectopic pregnancies. In one operated elsewhere, the distal half of the tube was removed. At this operation

TABLE III. TIME ELAPSED SINCE LAST PREGNANCY
(Seventy-nine cases)

79 cases—100%		21 cases—Period of relative sterility ranging from 6-17 years.			

the ectopic involved the proximal portion of the same tube.

Relative Sterility.—Of eighty-nine patients with previous pregnancies, the time elapsed since the last pregnancy was recorded in the history in seventy-nine cases. This is shown in Table III.

A period of relative sterility is minimized by many authors. Its occurrence in 26.6 per cent of our cases ranging from six to seventeen years seems significant.

Duration of Pregnancy, Site and Condition.—One of these pregnancies was a secondary abdominal pregnancy at eight months. Another was an intraligamentous pregnancy at twenty weeks. The remainder were fourteen weeks or under in duration. Pregnancy occurred in the right tube fifty-nine times and forty-two times in the left. Of these, three were interstitial with two located on the left and one on the right. Wynne found an incidence of 1.5 per cent in 1,547 cases. Our incidence of 2.9 per cent is relatively high. Recently Lisa reported an incidence of 6.3 per cent in 115 cases studied. The history gave the portion of the tube involved in seventy-eight of the 100 cases operated upon: thirty-two were in the ampulla, seventeen in the isthmus and three were interstitial. The distal half was involved in ten cases, distal two-thirds in six, and the whole tube and ovary in five. The remaining five were intraligamentous. Rupture posteriorly between the sheaths of the broad ligaments is exceedingly rare. Its occurrence in five of our cases (6.4 per cent of seventy-eight cases) is extremely high.

At operation seventy-one were found ruptured,

TABLE IV. PREGNANCIES PREVIOUS TO THIS ECTOPIC (89 CASES—239 PREGNANCIES)

No. Pregnancies	Termination	Per Cent
170	Del. at or near term	71.13
49	Aborted	20.5
15	Premature	6.28
5	Previous Ectopics	2.09
239 pregnancies—100%		

thirteen unruptured and sixteen were tubal abortions.

Previous Laparotomy and Pelvic Infection.—Thirty-two (31.3 per cent) of our 102 patients had undergone thirty-eight previous laparotomies. Scheffey, et al, Schauffler and Wynia, and Langman and Goldblatt found a high incidence in their series. This finding in almost one-third of our cases supports the observation that previous lower abdominal surgery contributes to the incidence of ectopic pregnancy.

Previous pelvic infection as an etiologic factor has been stressed by many observers. Its incidence by history in thirteen patients (12.7 per cent) is low. Histologic examination confirmed the low history rate. Fourteen tubes involved in the ectopic on section showed salpingitis. Five tubes removed on the opposite side showed salpingitis. This shows an incidence of 18.6 verified histologically.

Serologic tests in sixty-five cases revealed latent syphilis in five patients.

Previous Abortion.—Of the eighty-nine parous women in this group twenty-four, or 27 per cent, had aborted spontaneously one or more times. The abortion rate in the hospital during the same period was 16.6 per cent. Termination of 239 pregnancies occurring in these eighty-nine women prior to this ectopic is indicated in Table IV.

The abortion rate for the hospital (16.6 per cent) is lower than that for ectopics (27 per cent). This is not significant. However, the number of fruitful pregnancies, 71.13 per cent, is approximately that of the general population, 80 per cent. Therefore, this finding in our study indicates the fault is not with the fertilized ovum but the site of implantation.

Temperature, Pulse, Blood Pressure (Admission).—Only 9 per cent of the patients had an admission temperature of 100° F. or above, the highest being 102.2° F. Eighteen per cent were admitted with subnormal temperatures, 95° to 98° F. Most of these were in shock. Pulse rate and blood pressure roughly followed the degree of shock and hemorrhage. Systolic blood pressure ranged from "not obtainable" to less than 100 in 35 per cent of the cases; 10 per cent showed a moderate hypertension and 55 per cent were normal. The pulse rate varied from 90 to 180 in 55 per cent.

Symptoms.—Pain was the predominant symptom, occurring in 97.1 per cent of the patients. Pain was absent in only three cases. The largest number complained of colicky or crampy pain, severe and intermittent in character. Sudden, severe, stabbing or lancinating pain was next in order of frequency. In one-fifth of the patients it was confined to the lower abdomen involving either one or both lower quadrants. In the others, pain was more generalized throughout the abdomen. Shoulder strap or costal margin pain was elicited in 31 per cent. Painful defecation was a complaint in fifteen per cent.

General symptoms in order of frequency were nausea and/or vomiting 41 per cent, fainting or feeling of faintness 32 per cent, weakness and dizziness 20 per cent. Other symptoms were dysuria, urgency or frequency 12.7 per cent, diarrhea 5.9 per cent. None of our patients presented the so-called "morning sickness" observed in uterine pregnancy.

Vaginal bleeding was the next most common symptom. It was present in 77 per cent of our cases. The various types of bleeding are best demonstrated in Table V.

Amenorrhea.—Seventy per cent of our patients missed one or more periods. In 6 per cent the onset of symptoms occurred when menses were due. Twenty-four patients missed no periods. Eight of these gave a history of some abnormality of the last menses, either a scantier flow or a shortened duration. Frequency of amenorrhea is shown more clearly in Table VI.

Abdominal and Pelvic Findings.—The most common sign on abdominal examination was tenderness which was elicited in seventy-nine

cases. Distention was present in thirty-six cases, rebound tenderness in thirty-seven, rigidity in twenty-four, and evidence of free fluid in sixteen. An abdominal mass was palpated in ten instances. Adnexal mass or masses was the most frequent pelvic finding, palpated in sixty-four cases. Cul de sac fulness, crepitation or mass was noted in fifty-one instances. Other pelvic findings were painful tender cervix noted thirty-six times, purplish blue cervix nineteen, soft cervix eighteen, and Chadwick's sign positive three times. Cullen's sign was not observed. The corpus was described as normal in size in three-fourths of the cases and enlarged in one-fourth.

Abdominal distention, crampy colicky pain associated with nausea and vomiting, no menstrual abnormality and a previous laparotomy scar posed the problem of bowel obstruction in the differential diagnosis in nine cases. Flat x-ray plate of the abdomen ruled it out in eight cases. In the ninth, an x-ray diagnosis of paralytic ileus was made.

Blood Findings.—The blood pictures conformed to those generally observed by others. Details will be omitted. Initial hemoglobin readings and erythrocyte counts during or shortly after severe hemorrhage presented a false picture of the extent of blood depletion. Repeat examinations in forty-eight to seventy-two hours gave the true picture. In slightly less than one-third of our patients (33) the admission hemoglobin was under 60 per cent. Leukocyte counts were increased in the presence of hemorrhage and markedly so with massive hemorrhage. In forty-one cases the count was under 10,000. Sixty-one cases had counts ranging from 10,000 to 33,000. In thirteen patients (12.7 per cent) the leukocyte count was 20,000 or above. At operation in these the abdominal cavity was found filled with blood.

Erythrocyte counts were done in forty-three cases. The range was two to three and one-half million in twenty-one and three and one-half to four and one-half million in twenty-two. A falling red count and hemoglobin reading aided materially in diagnosis in several cases under prolonged observation. Recently a routine check of hemoglobin and erythrocytes on the third and seventh postoperative days has indicated a need for transfusion and prevented discharge from the hospital of patients with fairly severe secondary anemia.

Other Laboratory Examinations.—The Friedman test was done on sixteen patients; sedimentation rate on thirty-three; and the x-ray was used twenty-one times.

There were fourteen positive and two negative Friedman tests. In the two negatives, histologic examination of the tissue removed at operation showed necrotic, non-viable, degenerated villi.

The x-ray was of value in ruling out bowel obstruction. Lipiodol injection and x-ray in one case offered no aid. A metal contraceptive device was found imbedded in the myometrium by x-ray as an accidental finding in one instance.

The rate of blood sedimentation was determined in thirty-three instances. An attempt to correlate the finding with the amount of blood found in the abdominal cavity at operation and evidence of infection is not entirely satisfactory. In general, this showed that in twelve cases where the rate was markedly accelerated, the amount of blood found ranged from 800 c.c. to

TABLE VII. OPERATIVE PROCEDURES

Ligation bleeding point	1
Abdominal pregnancy	1
Appendectomy	7
Curettage	16

2,000 c.c. in eleven cases. In the twelfth case, salpingitis was found in the tube opposite the ectopic. In nine cases the rate was normal. Three of these were unruptured tubal pregnancies with no peritoneal insult. In five cases, the amount of blood found varied from 50 to 200 c.c. In the ninth case, several hundred cubic centimeters were found. There was no evidence of infection in any of the nine cases with normal rates. In the other twelve cases, the curves resembled those seen in chronic salpingitis. Findings were too confused to interpret properly but in general the hemorrhage was not recent.

Treatment.—These cases were cared for by eight attending staff members or under our supervision by the resident gynecologist. As would be expected there were individual variations in procedure. Immediate operation was the usual rule as soon as diagnosis was definite. Fifty-three were operated upon within one hour to less than twenty-four hours after admission. In four cases delay in operation was elected. Two ruptured under observation and went into severe shock. The outcome was favorable but their hospital stay was prolonged and they were submitted to unnecessary risk. When the diagnosis is definitely made, it is the author's opinion that expectant treatment has no place in the management of ectopic pregnancy. Removal of the affected tube only was the operation usually done. Concomitant surgery in this series is shown in

Table VII. Some of these procedures are not recommended.

Transfusion.—Autohemoclysis was not done in any of our cases. Transfusion was done before operation in four cases and during or after operation in the remainder. Forty-five of our patients received from one to several transfusions. Nineteen shock cases received forty-two transfusions and twenty-six non-shock cases received forty transfusions. The average amount was 1,400 c.c. for those in shock and 900 c.c. for those not in shock. Only three mild reactions ensued out of eighty-two transfusions administered. This is a reaction rate of 3.6 per cent. The reaction rate of the minor variety generally is estimated at from 5 to 10 per cent. In the three patients having reactions all were given single transfusions of 450 to 500 c.c. Eight patients received massive amounts of blood from 2,000 to 4,000 c.c. None of these had reactions.

From our experience the observation seems warranted that reactions due to presence of immune intragroup agglutinins and anti-Rh agglutinins recently emphasized in late pregnancy are not to be feared in early ectopic pregnancy.

Morbidity and Postoperative Complications.—Twenty patients (20 per cent) had a morbid postoperative course. The cause of pyrexia was undetermined in five. When incomplete peritoneal toilet (removal of old blood and clots only) was elected no increase in morbidity was noted. Colpopuncture four times and abdominal peritoneal aspiration once did not increase febrile reactions. This held true for preliminary curettage. Done sixteen times, curettage showed decidua in one case. The endometrial pattern in the remaining fifteen showed various phases, proliferative or secretory.

Complications alone or in combination were wound infections six, upper respiratory infection five, pneumonia two, cystitis two, pyelocystitis two, thrombophlebitis one, parotitis one and second degree burn one. Three wound infections associated with upper respiratory infection were slight; only one wound broke down.

Inhalation anesthesia was used in ninety cases. It is interesting to note that one of six cases done under spinal anesthesia had a morbid course and one of the two postoperative pneumonias occurred in one of the four patients operated upon

under local abdominal block anesthesia. This is a morbidity of 20 per cent for general anesthesia and 10 per cent for noninhalation anesthesia.

The average number of hospital days was 19.3 including pre-operative and postoperative days. Our high morbidity rate and a pre-operative hospital stay from one to three weeks in twenty-one instances accounts for the high average.

Summary and Conclusions

1. A survey of 102 ectopic pregnancies is presented. The percentage of cases admitted in shock is high (27.4 per cent).

2. Operative mortality was 1 per cent, total mortality 2.94 per cent. Prompt surgery even on moribund patients with availability of blood from the blood bank were factors in producing the low mortality.

3. Incorrect diagnoses can be materially lowered by proper interpretation of the history and evaluation of the clinical and laboratory findings.

4. A period of relative sterility from six to seventeen years occurring in 26.6 per cent of the cases seems significant.

5. A high incidence of previous lower abdominal surgery (31.3 per cent occurred. The incidence of previous pelvic infection (18.6 per cent) confirmed histologically is low.

6. Five recurrent ectopics (4.9 per cent) in this series is high. The occurrence of 6.4 per cent of intraligamentous pregnancies in the series is extremely high.

7. Fruitful pregnancies in the group prior to this ectopic approximates the general population rate. This indicates the fault is not with the ovum but site of implantation.

8. Abdominal pain was the predominant symptom. Shoulder strap or costal margin pain was

elicited in a high per cent (31 per cent) of the patients.

9. Abdominal distention in thirty-six cases is much higher than generally reported by others.

10. Routine repeat hemoglobin and erythrocyte determinations proved valuable.

11. Sedimentation rate was markedly accelerated in cases with massive hemorrhage.

12. A transfusion reaction rate of the minor variety of 3.6 per cent compared to the generally estimated rate of 5 to 10 per cent shows that ectopics tolerate transfusion well.

13. Reactions due to presence of immune intra-group agglutinins and anti-Rh agglutinins recently emphasized in late pregnancy would seem not to be feared in early ectopic pregnancy.

14. Two cases of tubal edometriosis were demonstrated histologically. Abdominal endometriosis in the upper angle of a previous operative scar was observed in one case.

HORMONES ARE ENGINEERS

Sex hormones, or gland secretions, act as "engineers" in directing the development of unborn animals, according to Dr. Vera Danchakoff of the University of Lausanne, Switzerland.

Dr. Danchakoff worked with a considerable range of animals, including mammals, birds, fishes and amphibians. In general, she found it possible to change the direction of sexual development by injecting the hormone of the opposite sex. That is, if the developing embryo were destined to become a female (which can be told by microscopic examination of its cell chromosomes), it could be induced to develop the external sex organs of a male by sufficiently heavy doses of male sex hormone. The opposite change could be produced by female sex hormone in a genetically male embryo.—*Science News Letter*, April 11, 1942.

THE FATE OF THE MAJOR SURGICAL CASE IN THE SMALL HOSPITAL

DAVID P. ANDERSON, JR., M.D.

Austin, Minnesota

APPROXIMATELY 27 per cent of active general hospital beds in the United States are located in hospitals of 100-bed capacity or less;¹ in the state of Minnesota 39 per cent of active general hospital beds are in this group of smaller hospitals. Although a few smaller hospitals are located in the large cities or suburban districts of large cities, the majority of these hospitals serve the small cities, towns, and rural communities of the nation. An untold number of patients requiring major surgical operations are treated in these small hospitals. The fate of these patients is little known, for the surgeon in a small community is seldom able to collect a large series of cases that he is justified in reporting to the profession, and, in smaller groups, one unfortunate case will unduly distort the statistical results.

It seems that a general survey of the quantity and quality of the major surgery performed in a small hospital in a fairly representative community should be of interest to the profession in general and of particular interest to those organizations that have done so much to obtain and maintain a high standard in the practice of surgery. It seems likely, too, that the ever-increasing number of young men who are receiving special surgical training should be interested in the scope of surgery away from their centers of training. Therefore, a six-year survey of major surgical cases in a small hospital has been made in an endeavor to ascertain the type of surgery and the fate of the patients under such conditions.

This survey includes all major general surgical operations performed by members of the Austin Clinic in the St. Olaf Hospital, Austin, Minnesota, for the six-year period ending March 1, 1942. These cases represent a majority of the major surgery performed in this hospital. Major otolaryngological surgery and ophthalmological surgery have not been included in this survey. In the cases reported operations were performed by one of four men: three general surgeons, all of whom have now been qualified by the American Board of Surgery, and one general practitioner who has limited his work to emergency cases. It should be noted that the St. Olaf Hospital has been enlarged and now exceeds the 100-bed capacity limit established for this survey. This hospital serves the city of Austin, which has a pop-

ulation of approximately 21,000, and smaller towns and rural districts within a radius of thirty-five miles.

A general survey of the 785 major surgical procedures included in this report is given in Table I. An attempt has been made to include only major cases, although the differentiation between "major" and "minor" cases is difficult at times. Thoracotomy and drainage for empyema thoracis has been considered as a major procedure, for example, although the actual operation may be less different technically than a high saphenous ligation, a procedure which is distinctly "minor" in character. Multiple-stage operations have been listed only once in this table, and combined operations, such as cholecystectomy and appendectomy, have been listed only under the title of the primary procedure.

The hospital mortality in this series of 785 cases was 3.9 per cent. A "corrected mortality" of approximately 3 per cent may be obtained by eliminating those deaths which occurred one month or longer after operation and which were not directly due to the operation. This is a reasonably satisfactory record. Nevertheless, there were a number of avoidable deaths in this series (Table II). These were due largely to errors in judgment or errors in diagnosis, although there was one death due to anesthesia.

A consideration of some of the various operations and specific surgical diseases covered by this survey is of interest. The most common disease requiring surgical treatment is appendicitis. In this series, 333 appendectomies for non-perforative appendicitis were performed without a death. The surgical mortality in thirty-five cases of perforative appendicitis was 8.6 per cent. There have been no deaths in the last twenty-two operative cases of perforative appendicitis, although one patient who had an incision and drainage of a localized purulent collection in the left lower quadrant died of generalized peritonitis which may have been appendiceal in origin. Two other patients, who were admitted in the advanced stages of peritonitis, were treated conservatively as probable cases of perforative appendicitis; autopsy in one patient revealed the presence of acute hemorrhagic pancreatitis.

MAJOR SURGICAL CASE IN SMALL HOSPITAL—ANDERSON

TABLE I. SURVEY OF OPERATIVE PROCEDURES

Type of Operative Procedure	Total Cases	Hospital Deaths	Type of Operative Procedure	Total Cases	Hospital Deaths
Craniotomy (extradural hematoma—depressed skull fractures)	3	0	Incision and drainage, perforative appendicitis	7	2
Thyroidectomy	15	1	Cecostomy for acute obstruction, large bowel	5	3
Cervico-thoracic ganglionectomy	1	0	Colostomy, palliative	6	1
Radical excision, carcinoma of the sub-maxillary gland	1	0	Colon resections (ileocolicectomy, combined recto-sigmoid resections, etc.)	9	2
Tracheotomy	2	1	Sigmoidotomy, benign polyps	3	0
Thoracotomy and drainage for empyema	6	1	Closure of fecal fistula	2	0
Resection, chondrosarcoma of ribs and pleura	1	0	Suprapubic cystostomy and prostatectomy	4	2
1st stage drainage, subdiaphragmatic abscess	1	1	Radical penectomy for carcinoma	1	0
Diagnostic abdominal exploration	9	1	Nephrectomy for hypernephroma	1	0
Subtotal gastric resection	3	1	Pelvic plastic and uretero-nephrostomy for non-calculus hydronephrosis	1	0
Gastro-enterostomy	3	0	Myomectomy	1	0
Closure, perforated peptic ulcer	9	1	Hysterectomy	43	1
Splenectomy	3	1	Vaginal plastic-suspension operations, etc.	38	0
Pancreatico-duodenectomy, 1st stage, for carcinoma of the ampulla Vater	1	1	Ectopic pregnancy, salpingectomy	5	0
Cholecystostomy	6	1	Salpingo-oophorectomy, elective	11	0
Cholecystectomy	48	1	Abdominal hysterotomy and sterilization	2	0
Cholecystostomy and choledochostomy	3	1	Ovarian cystectomy	17	0
Cholecystectomy and choledochostomy	5	0	Cesarean section	4	0
Acute obstruction, small intestine:			Elective herniorrhaphy	67	0
Due to postoperative adhesions	9	0	Femoral (8)		
Due to strangulated hernia	14	2	Inguinal (50)		
Due to intussusception	5	0	Umbilical (3)		
Due to gallstone ileus	1	0	Incisional (6)		
Small bowel resections, non-obstructed	2	0	Breast amputations for carcinoma	10	0
Ileostomy, for partial obstruction	1	1	Open reductions, major fractures	9	0
Incision and drainage, intra-abdominal abscess (non-appendiceal)	3	1	Internal fixation, intracapsular fractures of the femur	10	1
Elective appendectomy, recurrent appendicitis	48	0	Sequestrectomy and drainage, osteomyelitis	7	0
Acute non-perforative appendicitis, appendectomy	285	0	Amputations, major	5	2
Appendectomy and drainage, perforative appendicitis	28	1	Resection of scapula, partial, for osteochondroma	1	0

There were two deaths in twenty-nine cases of acute obstruction of the small bowel, a mortality of 6.9 per cent. The mortality in sixty-two operations on the gallbladder and biliary tract was 4.8 per cent; in forty-three total and subtotal hysterectomies, there was one death from pulmonary embolism, a mortality rate of 2.3 per cent.

There have been twenty-two major surgical procedures in the past two and a half years for the radical cure of cancer. These procedures include gastric and colon resections, radical mastectomies, total hysterectomies for carcinoma of the fundus uteri, a nephrectomy for hypernephroma and other types of major surgery. The mortality in this group was 13.6 per cent. The mortality was approximately 27 per cent in eighteen major procedures for the diagnostic and palliative treatment of malignancy. There was

one opportunity to perform a resection of the duodenum, common duct and head of the pancreas for carcinoma of the duodenum at the ampulla of Vater. There have been only sixty-four operations of this type reported to date.² This patient died of chronic nephritis and uremia on the nineteenth postoperative day. An autopsy revealed no technical errors in the operative procedure, but the presence of early liver metastasis had not been detected clinically.

Attention is called to the fact that a few of the operative procedures in this series are not strictly within the scope of general surgery. The surgeon in a small community is occasionally called upon to perform an emergency operation, such as a cranial decompression, that he would otherwise gladly refer to a surgeon specifically qualified in one of the special fields of surgery.

					B.E. WF 45	Incarcerated incisional hernia	None	Spinal anesthesia	in OR

In elective cases, those patients who required orthopedic or neuro-surgical operations, extensive or delicate plastic procedures, transurethral resection, and similar special treatment beyond the scope of the general surgeon, were referred to nearby medical centers.

Summary

A survey has been made of the major surgical cases treated by members of the Austin Clinic in the St. Olaf Hospital in Austin over a six-year period. This survey has been presented in order to give a general idea of the scope of surgery in a small community.

The trend of medical education in the past few years has been toward the elimination of the self-trained and often self-named surgeon. Post-graduate teaching courses and surgical residencies

have been increased in order to afford adequate surgical training to a larger group of medical graduates. It is logical to assume, however, that the standard of surgery throughout the nation will not be proportionately increased unless a fair number of well-trained general surgeons elect to practice in smaller communities. This report is offered as a basis for an estimation of the quantity and quality of major surgery which is encountered in a smaller community.

The author wishes to express his appreciation to Dr. U. Schuyler Anderson, of Minneapolis, Minnesota, and Dr. Francis E. Kibler, of Colorado Springs, Colorado, for permission to report their cases and for their kind coöperation.

ANESTHESIA IN THE SMALL HOSPITAL

HARRY B. NEEL, M.D.

Albert Lea, Minnesota

THE selection of the anesthetic agent to be employed in an operative procedure is the responsibility and privilege of the surgeon. In deciding on the anesthesia of choice he may be advised by the anesthetist, and he may be cognizant of the wishes of the patient, but with his knowledge of the physical condition of the patient, gained from a carefully taken history and a physical examination thoroughly performed, and with the requirements of the proposed surgery in mind, the surgeon should be able to select the most suitable form of anesthesia from several at his command.

The surgeon who leaves this decision to the anesthetist alone, or who accepts the anesthesia which is given most conveniently, or who is thinking entirely of saving time, is placing himself at a disadvantage before the actual operation begins, and may be causing great deprivations to his patient. The operator who is accustomed to but one method of anesthesia is not accepting the opportunities which medical progress has made possible.

The recognition of the importance of anesthesia is manifested by the growth of the specialty of anesthesiology and by the establishment of departments of anesthesia in the large medical centers. In some measure this specialty of anesthesiology is the product of convenience and interest, as are other specialties, and does not indicate that the small institution without physician-anesthetist cannot offer good and proper anesthesia. It has been stated recently that all anesthetics should be administered by physician-anesthetists. This has been disconcerting to the small institution where physicians who devote their full time to anesthesia are not available. The experience of many, including ourselves, is that properly trained nurse-anesthetists are absolutely reliable and can administer inhalation anesthesia entirely satisfactorily. The employment of nurse-anesthetists in all cases is much preferable to the use of a physician who has had little experience and infrequent practice in the administration of anesthesia.

An analysis of our cases at the Næve Hospital during the past eighteen months has been of considerable interest. Of 254 patients submitted to operation, 117 (46 per cent) have received inhalation anesthesia, usually nitrous oxide, oxygen, and ether. So skillfully has the anesthetic been administered by our nurse-anesthetists* that in not one instance have we been concerned about the anesthetic during the course of the operation, and there have been no deaths attributable to the anesthetic. There have been few complications in any way related to the anesthetic and only one case of atelectasis. In this instance the mucous plug was removed through the bronchoscope and the patient made a prompt and complete recovery.

Although we have been prepared to insert an intratracheal tube if necessary, the need for this has not arisen. It is possible that we are overlooking some of the advantages of the intratracheal tube but when the airway is adequate and relaxation satisfactory we have seen no reason to place a tube in the trachea. The necessity of an intratracheal tube in certain conditions is incontestable and the availability of a tube and a laryngoscope may occasionally save a life. Every operating room should possess facilities for inserting an intratracheal tube.

For major surgery inhalation anesthesia is still probably the safest in the majority of cases. One reason for this is that this method is the oldest and is the best understood by physicians and

Presented at the meeting of the staff, Næve Hospital, Albert Lea, Minnesota, April 13, 1942.

*Miss Mary King and Miss Mabel Peterson.

anesthetists. There are contradictions to inhalation anesthesia, however, and there are desirable features of anesthesia which an inhalation agent does not afford. In such instances one must employ another method of producing anesthesia.

Fig. 1. Equipment used for preparation and administration of intravenous anesthesia: (1) One ampule of pentothal sodium; (2) two 20 c.c. ampules of sterile distilled water; (3) file; (4) sponges; (5) two needles No. 20 gauge; (6) two 20 c.c. syringes. The rubber tubing is necessary only when the Rudder syringe holder is used.

Intravenous Anesthesia

Pentothal sodium has been administered intravenously in 2.5 per cent solution seventy-four times, excluding uses of this agent outside of the operating room. We find that we are using this form of anesthesia more and more frequently and for operative procedures of longer duration. The use of pentothal sodium has received such wide publicity that there is little that we can add from our experience except to point out that it is a splendid agent for use in the small hospital. The growing popularity of this anesthetic in our hospital is in keeping with the trend in larger institutions.

Very little equipment is necessary for the preparation and administration of this drug. The equipment which we use has been reduced to a

minimum and is shown in Figure 1. A 5 per cent solution is obtained by drawing 20 c.c. of distilled water into a syringe and adding it to the vial containing one gram of pentothal sodium. The solution is thoroughly mixed and 10 c.c. is

Fig. 2. Pentothal sodium anesthesia administered with the Rudder syringe holder and the BLB mask.

drawn into each of two syringes. Into each of these syringes is then drawn an additional 10 c.c. of distilled water. The plunger of the syringe is drawn back farther than is necessary and the syringe then shaken vigorously. Each syringe now contains 20 c.c. of a 2.5 per cent solution of Pentothal Sodium which is ready for administration.

It is important to perform a "clean" venipuncture. Extravasation of the solution into the tissues, although usually not serious, may cause the patient unnecessary pain and delay the induction. About 5 c.c. of the solution is then injected slowly while the patient counts, and this amount is usually sufficient to produce unconsciousness. The depth of respiration is carefully observed. To maintain the proper depth of anesthesia, the anesthetic solution is injected intermittently in small amounts as indicated. It is felt that the administration of an intravenous anesthetic, if carefully and skillfully performed, is as much under control as is the administration of inhalation anesthesia.

Recently we have used pentothal sodium in combination with oxygen very satisfactorily for major abdominal surgery. The Rudder syringe holder is employed and the anesthetist is able to administer the anesthetic and to watch the condition of the patient just as carefully as in inhalation anesthetics. Following the suggestion of Dr.

C. H. Watt, of Thomasville, Georgia, a small quantity of procaine hydrochloride has been injected in the skin before making the incision. Relaxation has been excellent, and the patients have benefited by the absence of nausea and vomiting. Dr. Watt is of the opinion that this pentothal sodium-oxygen combination allows a more rapid recovery and shortens postoperative hospitalization.

Spinal Anesthesia

As stated by Blalock, the most important factors which govern the choice of an anesthetic agent are the safety of the patient and the effectiveness of the anesthesia for the operation proposed. It has been said that no anesthetic facilitates the work of the surgeon more nicely, and yet is more hazardous to the patient, than spinal anesthesia. Graham and Brown are of the opinion that a surgeon is guilty of malpractice if he operates on a patient with intestinal obstruction under inhalation anesthesia if adequate facilities for spinal anesthesia are available, and Masson has said that he would employ spinal anesthesia more frequently if he did not have a good anesthesiologist. There is a growing enthusiasm for spinal anesthesia which is occasionally dampened by reports of serious complications, and even fatalities. The dangers associated with the employment of a spinal anesthetic should not be minimized and the actual administration of the anesthetic should be undertaken only by competent persons.

It is desirable to restrict the use of spinal anesthesia to operations below the diaphragm and the danger is decreased if it is still further limited to operations below the umbilicus. In patients with emphysema, bronchiectasis, active pulmonary tuberculosis, asthma, chronic bronchitis

TABLE IV. DOSAGE AND DILUTION OF METYCAINE IN SPINAL ANESTHESIA†

Operation	Injection between lumbar vertebra	Metycaine dose (Mgm.)	Total volume anesthetic solution and spinal fluid (c.c.)*
Appendectomy	2 and 3	100—150	3
Herniorraphy	2 and 3	100—150	2.5—3

*Rate of injection not greater than 0.5 c.c. per second.

and acute upper respiratory infections spinal anesthesia is particularly useful. In diabetic patients it is important to interfere as little as possible with the dietary regime, and spinal anesthesia affords a quick recovery. Finally, spinal anesthesia is useful in operative procedures which require complete relaxation, and in the repair of hernias, removal of large pelvic tumors, surgery of the colon, and amputation of a lower extremity.

As a general rule it has been our custom to reserve the use of spinal anesthesia for surgery of the lower abdomen, perineum, and lower extremities. In the occasional case, if conditions demand, spinal anesthesia is employed for operations on the upper abdomen. It is my impression that in producing spinal anesthesia complete familiarity with one anesthetic agent, gained by continual use of that agent, is preferable to the occasional use of one of several drugs. I have used metycaine exclusively and with complete satisfaction. The dose is somewhat smaller than that of procaine and never exceeds one milligram per pound of body weight. The largest dose which we found necessary was 175 mgm. The amounts which we customarily use, and the dilutions necessary, are tabulated according to operations in Table IV.

An attempt has been made to simplify the administration of a spinal anesthetic and the equipment necessary is shown in the illustration. The use of a punch and a guide for the needle seems unnecessary to me, and only traumatizes the tissues, resulting in severe backache in many cases.

A spinal puncture needle of small calibre (No. 21 gauge) is used routinely and in no case has it been impossible to obtain spinal fluid and to inject the anesthetic. Ephedrine sulphate, 25 to 50 mgm., is given subcutaneously in each case

Fig. 3. Tray for spinal anesthesia: (1) Drape sheet; (2) file; (3) ampule ephedrine sulphate 50 mgm.; (4) ampule metylocaine hydrochloride, 2 c.c., 10 per cent solution; (5) solution procaine hydrochloride 1 per cent; (6) tincture of iodine; (7) sponges; (8) Luer-Lok syringe; (9) three needles—hypodermic, 2 inch, No. 21 gauge spinal puncture needle; (10) hemostat.

and in only one instance was the fall in blood pressure sufficient to necessitate another injection of the drug.

In our small group of cases we have used spinal anesthesia sixty-three times. In sixty-one patients the anesthesia produced was entirely satisfactory. In one case insufficient anesthesia was obtained and it was necessary to perform the operation under local procaine infiltration anesthesia supplemented with pentothal sodium given intravenously. In another case the anesthesia produced was only partial. There was one case in which the patient complained of backache and one case in which headache followed the anesthetic. Both of these complaints were no longer existent when the patients were dismissed from the hospital.

Although we have used sacral block anesthesia for anorectal surgery, we have come to rely on spinal anesthesia for surgery in this field. Sacral block anesthesia is unquestionably excellent but

it is sometimes difficult to administer and we feel that the seven punctures necessary are more painful to the patient than the one required for spinal anesthesia. We continue to employ sacral block anesthesia frequently enough to keep familiar with the technique, and in those patients who object to spinal injections. For ano-rectal operations we have found small doses of metylocaine injected in the third lumbar interspace, and in weak dilutions, to give perfect anesthesia.

Conclusion

It is imperative that we give adequate attention to, rather than minimize, the importance of anesthesia. The administration of the anesthetic should be considered an integral part of the surgical procedure, the success of the latter depending to a great degree on the choice of the anesthetic agent and the skill with which it is administered. Although the great advances in the art of anesthesia will probably be made by the anesthesiologists, the surgeon should be aware of the progress that is being made and he should be able to administer the special forms of anesthesia. In the small hospital, general inhalation, intravenous, local, spinal and sacral block anesthesia should be available, and facilities for insertion of an intratracheal tube are highly desirable.

PLANT HORMONE STIMULATES

A hitherto unidentified sex hormone produced by plants, strongly stimulating sexual maturation in female animals, has been reported by Dr. Eliseo T. Gomez, U. S. Department of Agriculture physiologist. Extracts from freshly cut or frozen young oat and corn plants, Dr. Gomez found, would produce evidence of sexual maturity when fed to female rats only three weeks old, which did not appear in untreated "control" animals until they were a good eight days older. Puppies showed similar signs of precocious maturity when they were nursed by mothers (or foster mothers) receiving the plant extracts in their diets. —*Science News Letter*, April 11, 1942.

RURAL NURSING PROBLEMS

LOUISE NEWCOMBE

Duluth, Minnesota

THE problems of rural and urban nursing are not very different. In each it is of most importance to see that the patient receives the best care possible, and this calls for nurses not only for bedside nursing, but for specialized departments, as Operating Rooms, Obstetrics, Pediatrics and for supervision and teaching, if there is a nursing school. Sometimes the care of the patient and the teaching of the student seem to conflict somewhat, and it is a problem to see that each gets its fair share. There is also, and always, the problem of keeping expenses within the budget, as nursing schools, unlike other schools and colleges, receive no aid from the government or the public. I wish to qualify that by saying that just recently Federal aid has been made available for certain schools.

For some time we have been hearing of a graduate nurse shortage and sometimes the Board of Nurses Examiners is accused of having closed the smaller schools. As a matter of fact, the schools closed by our Board have been very, very few. It is true that at one time, about eighteen to twenty years ago, we had sixty-three accredited schools in Minnesota, and now only twenty-nine, but the economic situation entered into this picture. During the last war we had a serious nurse shortage; hospitals were urged to increase their student enrollment, and did so; and then you will remember that along about 1929, ten to twelve years ago, there appeared more or less suddenly to be a great surplus of graduate nurses and too many students in the schools. This was of course coincident with the general depression and, while nurses were not the only group that suffered, nevertheless in some of the eastern cities nurses were in the bread lines, and considerable attention was drawn to the matter. It was discovered also that nurses who had received a broader basic nursing education fared better, because more fields were open to them, while those whose nursing education had been limited found it difficult to get employment.

All hospitals were urged to curtail enrollment and employ their own graduates, and nurses could

be had for as little as \$20, \$25, \$40 per month and even for maintenance only, in some cases. So it was only natural and logical that many smaller hospitals closed their schools, because it was cheaper and easier to staff their hospitals with their graduates. Patients and doctors liked the graduate service and the graduates liked the regular hours and steady work. This is really why we have fewer schools in Minnesota, and I wish to emphasize that this was by no means confined to Minnesota, but was general in the United States.

Then once again the economic pendulum swung and we emerged from the depression; work became plentiful; salaries and wages started going up; hours of work were shortened, and we began to hear of difficulty in getting graduate nurses; and this again was nationwide and was not limited to the nursing profession alone.

It always takes time to realize a "trend" and also more time to decide what to do about it. Hospitals were afraid, for various reasons, to increase their student body too rapidly and found difficulty in meeting the rising costs.

Nurses had learned much during the depression too. No longer were they willing to work long hours, and the eight-hour day came into effect, even for private duty nurses. They wanted higher wages too and got them, but slowly. Student applicants also wanted to be very sure they were going to receive an adequate nursing education which would fit them to hold their own in the economic world. In short, they were all looking for their share in the more abundant life we were hearing considerable about at that time.

Hospital ward aides came into use about that time, but more of them later.

Student enrollment has increased steadily. From January 1, 1937, to January 1, 1942, there was an increase of 22 per cent in Minnesota. Graduate registration has risen also. From January 1, 1937, to January 1, 1942, the increase was 47.3 per cent in Minnesota. Why then are we short today? For the following reasons:

1. Public Health Nursing (Jan. 1937 = 19,939; Jan. 1, 1941 = 23,705 — nearly 4,000 more).

Read before the meeting on Interprofessional Relations held at St. Cloud, Minnesota, April 23, 1942.

2. Industrial Nursing (Jan. 1937 = 2,203; Jan. 1, 1941 = 3,092—nearly 1,000 more). I am sure this number has increased since then due to our defense industries.

3. Airlines and passenger trains—stewardesses, new field attractive, short hours, good pay, travel, meeting people, et cetera.

4. Hospitals put in an eight-hour day and six-day week, in line with other branches of industry, and this has taken a good many more.

5. Marriages increased with improved economic conditions. Some married nurses work, but others do not.

6. Lastly, the war, Red Cross and federal services claim many. There are no definite figures available as this is a military secret but there were approximately 11,000 on duty sometime ago.

Figures from Red Cross for the United States:

1. Transfers from First Reserve (go anywhere) to Second Reserve (active, available, but not for military duty, which means not available for armed forces) from December 4, 1941, through January and February, 1942, due to marriage were 863, an average of 288, almost 300 per month.

2. Transfers as above, for the same period for all reasons were 1,773, an average of 591 per month (almost 600).

3. Transfers from First to Second Reserve for twenty-nine months prior to Pearl Harbor were 400 per month.

Demand for nurses has increased tremendously since the United States entered the war. Our men have been sent to the four corners of the world and of course our doctors and nurses follow our fighting men. Six nurses per 1,000 men are required in the Army and three nurses per 1,000 men in the Navy; and seven doctors per 1,000 men in the Army and six doctors per 1,000 men in the Navy; and 1.5 dentists for both. The National Defense Council meeting in Chicago recently said 55,000 new student nurses must be recruited this year and 65,000 next year. As our usual national admissions equal about 35,000, we need about 20,000 more this year. The Army Nurse Corps needs 10,000 more nurses before July 1. The Army Nurse Corps needs 31,000 nurses to be on duty by the beginning of next fiscal year, July, 1942.

To blame anyone for the shortage, in view of all the above, would of course be unfair. It is just one of those economic cycles or situations which we all have to face, and face together, and try to find a solution for. Fortunately, in Minnesota, the medical, hospital and nursing groups

have always had good working relationships, and I have no doubt at all, that working together, we will find a way out.

What to Do

1. Increase student enrollment in existing schools. This is being done, as I have told you. Federal funds have recently been made available for schools now in operation, which can meet the government requirements and wish to do so, for the one purpose of increasing the number of nurses. Our national government stresses the fact that standards *not* be lowered.

2. Refresher Courses to older, inactive nurses. This is being done in many places, and with good success, and these nurses promise to be available to help when needed.

3. Possibly reopen schools now closed, if the hospitals desire.

4. Ward aides used for non-nursing duties and also the American Red Cross Volunteer Nurses Aides and WPA and NYA Auxiliary Hospital Workers.

Procedure If Hospital Wishes to Reopen Closed School

1. Should have such facilities and nursing program as will prepare their graduates to meet requirements for state registration, as well as the requirements of the Red Cross Nursing Service, since nurses enter the Army and Navy Nursing Services through the avenue of the Red Cross.

Previously the Red Cross had under consideration requiring daily patient averages of fifteen surgical, fifteen medical, ten obstetric in segregated service, eight to ten pediatric segregated service, and deficiencies made up by affiliation. The Red Cross will now accept for the duration of this emergency a daily minimum average of fifty, with deficiencies made up by affiliation.

The Red Cross requirements explain in brief many of the requirements of the Nurses State Board of Examiners. It must also be remembered that graduate nurses wish to be eligible to work in any state, if they choose. California requires that all nurses graduating since January, 1941, have had a minimum of six weeks in contagion or tuberculosis training. This is very difficult to meet, but they will accept venereal nursing as a small part.

Minnesota's educational requirement is only two years of high school by law, but the schools themselves have for years required high school graduation. Only one school requires two years of college. Our Board does not, and could not, require more than our law permits. Most states

do require high school and therefore our nurses need to have had full high school to be able to take advanced work or postgraduate courses, as well as to be able to register in other states.

Affiliation is required when clinical service is inadequate. Our Board has always recommended that the students should return to the home school after affiliation for at least the last six months, and as much longer as possible. Schools have always appeared to fear that their students would not be satisfied when they came back. Hospitals in rural districts often complain that their nurses do not wish to stay in the country after being in the city on affiliation. Well, isn't it natural they should seek the social and cultural advantages of the city just as other workers do? After all, young nurses are just like other young women, and where does "girl meet boy?" Someone once said young nurses were "mobile maidens meditating matrimony."

Our Board is the logical accrediting agency—there is no other—and, when the state places on us the responsibility to determine whether a graduate nurse is eligible for registration, it goes without saying that we have to know considerable about the hospital school from which she came. Just as in the case of accrediting hospitals for the teaching of interns, many requirements must be met.

Our Board very earnestly and sincerely wishes to be of help to all schools now operating and also to those hospitals which may wish to open schools. However, we are handicapped in this, as our law does not permit traveling expenses to any Board member for visiting schools, and at present we have no Educational Director. So, if hospitals wish our advice, it would be necessary that they pay our traveling expenses, and we would give our own time to it for the present.

When a school wishes to open, our procedure is to ask for an annual report for the previous year, showing daily averages in the clinical services, also the qualifications of the nursing staff who will be doing the teaching of the students.

At present, we are studying the clinical services in all our schools, trying to discover untapped resources which might be used for affiliations for smaller schools or for other schools which may wish to enrich their own course. For the past two years, we have been studying the adequacy

of clinical services in our existing schools, to determine if affiliation is necessary.

When a school wishes to open, they should send us in writing an outline of what they propose to do. Of course, they can make no promise to prospective students that the school will certainly be accredited, but it must be in operation as a going concern for not less than six months, as paper plans do not always materialize as expected by those who make them.

There is one more point I wish to mention—that of ward aides, nurses aides or subsidiary workers (now we are being asked to say auxiliary workers). Some people fear this group and are afraid they will get out of hand and prove a menace. I see their point of view, but I do not share it. However, I do feel these workers should be chosen carefully; have their duties clearly assigned; work under the supervision of the head nurse to whose floor they are assigned for duty, and be kept in their proper place. They should be trained for specific duties—not educated. They should be well treated and made to feel they have a place in the organization, but definitely not as nurses. The better ones may wish later to enter the nursing school, when they have earned the money, and they should be encouraged to do so, and chosen with that in mind. Up to now, their duties have been non-nursing, but there is no reason why they cannot be shown how to give, in certain types of cases, as good a bed bath as a student nurse. After all, members of a family often do. And we may have to change our conception of what constitutes non-nursing duties. There is no need ever to make a mistake in choosing for the nursing school one of these workers who has spent six months as a ward aide. Every ward aide taken into school has made good, in my experience.

"Essentials of a Good Hospital Nursing Service" and "Essentials of a Good Nursing School," have been recently revised, by a committee working under Dr. Faxon and composed of representatives of the American Medical Association, American College of Surgeons, American Hospital Association, American Nurses Association, National League of Nursing Education and Public Health Association. These are invaluable to those responsible for the good care of patients and good teaching of students, and it speaks well that all the above groups united in the re-

vision of them, as they did in the original preparation.

In conclusion, though our problems seem difficult, they are part of the cycle or situation in

which we live at present. I am confident we will find our way out by all working together. We need your coöperation. We wish to give you ours.

CLINICAL-PATHOLOGICAL CONFERENCE

MINNEAPOLIS GENERAL HOSPITAL

Frank C. Andrus, Pathologist

Presentation of a Case

DR. S. BLACKMORE: The case is that of a fourteen-year-old negro male who was first seen at the hospital at the age of four years. He was admitted at that time with the history of pain and swelling in the right thigh and lower legs for four days before admission. He had also been dyspneic for four days. Physical examination revealed a child with a distended abdomen. There was a systolic murmur at the apex of the heart. There was definite swelling in the right thigh with pain on motion. There was pain on motion of the extremities or contact. A diagnosis of peri-osteitis, either tuberculous or syphilitic in nature, or osteomyelitis was made. He was studied in the hospital for thirty days, during which time spinal tap, x-rays and Mantoux were done. These were essentially negative. The diagnosis on discharge was undetermined.

His present admission was on July 14, 1942, when he came in with complaints of back pain and abdominal pains. The pains had started on July 10 and had come on suddenly, accompanied by malaise and fever. He also had two or three bouts of vomiting. On the following morning, he went to a private physician, who gave him an enema and sent him home. On July 12, the patient was perfectly well, felt fine, and went fishing. On the next day, however, he again had an attack of abdominal pain and a generalized feeling of illness. He was brought to the hospital approximately four days after the onset of his illness. He had previously had several attacks of this nature. The mother stated that prior to each attack she had noticed a slight icteric tinge in the scleræ.

Physical examination revealed a poorly nourished negro youth of fourteen years, who was in no acute distress. He complained of vague joint pains and generalized abdominal tenderness, apparently more severe in the lower quadrant. There were palpable submaxillary lymph nodes on both sides which felt shotty, but were not tender. Examination of the eyes revealed an icteric tinge to the scleræ. The chest was negative except for enlargement of the heart to the left. A harsh systolic murmur was heard over the entire precordium and transmitted to the axilla. The temperature was 101 degrees and pulse 120 per minute. The patient weighed

but 58 pounds. He evidently had not been eating very well, and was dehydrated. Examination of the abdomen revealed bulging, but no evidence of ascites. There was tenderness to deep palpation. The extremities were normal.

Laboratory data: The Wassermann test for syphilis was negative. The hemoglobin was 42 per cent, erythrocyte count 2,000,000, leukocyte count 11,400, with 73 per cent neutrophils, 7 per cent lymphocytes and 10 per cent monocytes. The urine was negative. There was no urobilin or urobilinogen in the urine. The hemacrit was 25 per cent. A quantitative urobilinogen was 7.7 mg. on a twenty-four-hour specimen. A blood culture was negative. The icterus index was 14, and the van den Bergh showed a slight trace to the direct reaction. A fragility test was run with the control beginning at .40 per cent sodium chloride and completed at .30. The patient's red cells began to show hemolysis at .38 and completed at .13. Blood morphology studies from a sternal biopsy revealed marked anisocytosis, poikilocytosis and polychromasia. There were occasional normoblasts showing sickle shaped red cells.

DR. GRATZKE: Here is a radiograph of the chest. He has an enlarged heart of the left ventricular type. There is nothing definitely characteristic in the radiographs of the skull. We took plates of the bones of his hands and we see here that there is loss of cortical bone. The cortex is a good deal thinner. The phalanges, as well as the ends of the long bones of the forearm, show the picture of chronic hemolytic anemia.

DR. FRANK ANDRUS: This is due to the expanding of the bone marrow. Are pathological fractures common in cases like this?

DR. GRATZKE: No. Primarily because these individuals are very inactive because of their anemia.

DR. PAUL HEISE: Sickle cell anemia is a rare blood dyscrasia almost exclusively found in negroes, and characterized by varying degrees of anemia associated with specific alterations of the morphology and behavior of erythrocytes. It was first described in 1910 by Herrick. His original description was such that today, with our present knowledge of the condition, we can add little to his original dissertation. In 1911, Cook and Meyers, working with Emmel, studied a case

of sickle cell anemia, and in their thorough investigation discovered that the father of their patient also had sickle cells in his blood. This was the first indication that there was a hereditary factor. Mason, in 1922, summarized the previous cases and decided that a separate disease entity had been discovered, and gave it the name of "sickle cell anemia." The terminology was rather loose until in 1920, Cooley and Lee discovered there were many individuals of the negro race who showed sickling in their blood, but who had no clinical manifestations of the disease. They called this condition sickle anemia to be differentiated from those with sickle cells plus clinical manifestations of anemia. The disease is almost entirely limited to the negro race. There have been reports of Greeks and Italians with sickle cells in their blood, but Laurence (1931) stated that there have been no unquestioned cases of sickle cell anemia in the white race. Cooley, in a series of 400 cases, found 7.5 per cent of the negroes with sickle cells in their blood; Randeau, with 150 cases, showed 6.6 per cent Graham, with 1,500 cases, showed 8.1 per cent, and Tomlinson with 275 cases, 6.5 per cent. Sydenstricker stated that 1.5 per cent of American negroes showing sickle anemia had sickle cell anemia.

The age of persons showing sickle anemia varied from birth to seventy-eight years. According to Mason, only three cases of sickle cell anemia have been reported past the age of thirty years, and no cases have been reported past the age of thirty-five years. The symptoms of the disease usually appear between the ages of one to ten and the patient is usually first seen at about the age of thirteen years. That heredity is the largest etiological factor that has been conclusively proven. The hereditary factor is a single, dominant, nonsex-linked Mendelian characteristic, according to Huck. In sickle anemia there are no symptoms or physical signs aside from the presence of sickle cells which may be demonstrated in the blood.

Sickle cell anemia shows the following symptoms: The patient has usually been ill and weak since infancy, with remissions and exacerbations, joint and muscle pain and fever. One of the most characteristic signs is severe abdominal pain which is believed to be caused by areas of infarction occurring in the spleen. The patients are usually weak and breathless after exertion. The sclerae have a yellowish tinge and there is moderate lymphadenopathy. The heart is enlarged and of the left ventricular type. A systolic murmur is often present. Ulcers may or may not be found on the lower legs about the ankles. The ulcers are usually large, punched out areas with granulating surfaces. There is usually hepatomegaly, and early in the disease, splenomegaly. The frequency of abdominal seizures determines the size of the spleen, which becomes smaller with each exacerbation.

The hematological picture reveals the red blood count to be often between one and three million, a low hemoglobin, with a color index below one, extreme characteristic poikilocytosis with as many as 50 per cent of the red cells being deformed, the majority of them being elongated, sharply pointed at one or both ends, with a tendency to be crescentic. The reticulocytes are increased from 20 to 40 per cent. There is leukocytosis from 15,000 to 30,000 with normal distribution. The platelets are normal, and there is usually a shift to the right of the Arnetz count. Phagocytosis of red blood cells may be seen, both *in vivo* and *in vitro*. The cells stain more deeply and may have longitudinal striping. There is polychromatophilia, anisocytosis, and the normoblasts may be present in large numbers. There is often a diffuse punctuate basophilia.

There is increased resistance to hypotonic solutions of saline. Normal red cells begin hemolysis at .4 per cent and are completed at .36 per cent. In Cooley and Lee's cases average hemolysis began at .39 per cent and was completed at .25 per cent. Sickle cells are found to have more resistance to hypotonic solutions than the round forms. The sedimentation rate is increased and the

icterus index rises. There is usually a positive indirect van den Bergh. The bleeding and clotting times are normal. Gastric analysis reveals either a hypo or achlorhydria according to Dreyfus. The sickling phenomena may be demonstrated by allowing a hanging drop preparation or a paraffin ring preparation to stand. You then see deformity of the red cells ranging from triangular or quadrangular cells; filiform or crescentic cells. The cells seem to be influenced by the clotting and pressure of the cover slips. Huck states that if these cells are allowed to continue to stand, the sickle cells return to the normal shape of red blood cells. Sydenstricker believed serum to be essential to this sickling. Bell found no sickling to occur if the washed red blood cells were replaced in their own homologous serum. Red blood cells from sickleemics sickled in normal homologous serum, according to Sydenstricker. Hahn and Gillespie showed that sickling readily occurred in decreased oxygen tension or where red cells were suspended in carbon dioxide, hydrogen or nitrous oxide. When these gases were replaced by oxygen, the sickle cells returned to normal shape. Cooley and Lee found that a preparation at incubator temperature the sickle cells disappear and leave only the round cells. They concluded that the cells of sickle cell anemia hemolyzed at incubation temperature in their own serum and normal serum, and that the serum of sickle cell anemia was not hemolytic for normal cells.

In cases of sickle anemia, sickle cells are found usually in all organs of the body in fixed tissues at postmortem. There are hemosiderin deposits in the liver, spleen and kidneys. The spleen is said to show malformation of the sinuses, especially about the Malpighian bodies, with pools of blood partly or completely surrounding the Malpighian bodies. There is abnormal development of the capillaries. The reticulum is not primarily abnormal. In sickle cell anemia, the leg ulcers which are found are not characteristic. The left ventricle of the heart is enlarged, and there is fatty metamorphosis of the myocardium. The spleen varies in size from 600 to 2 grams. The age of the patient does not determine the size of the spleen, but rather the spleen is shown to become smaller after many remissions and exacerbations. If atrophy takes place there is progressive capsular thickening with fibrosis. The liver is slightly enlarged and the sinusoids are engorged with blood, often there may be periportal fibrosis. The Kupffer cells can be seen to contain phagocytosed red blood cells and hemosiderin. There are islands of hyperplastic red marrow and areas of necrosis. There often is some intramembranous bone formation and evidence of increased hematopoiesis. On x-ray, porous and lace-like reticulation can be seen.

An attempt to explain the pathology and symptomatology of the disease was made by Bauer, who believes that all hemolysis was caused by mechanical impaction of masses of deformed red blood cells in the smaller blood vessels of various organs. This impaction with subsequent hemolysis and the resulting conglutinated masses, was responsible for the further pathologic changes and the clinical symptoms of sickle cell anemia. The liver, spleen, and kidneys showed this red blood cell engorgement and stasis. This stasis develops because the misshaped cells are unable to pass through the small vessels. This change is especially noted in organs with a slow blood flow as in the spleen, liver, or lymph nodes. This stagnation produces thrombosis, ischemia, infarction, fibrosis and resolution of red cells with subsequent anemia. The anemia is not constant and once the bone marrow can not compensate for the destruction, circulatory stagnation in the bone marrow, there results an impairment of the regenerative powers and further anemia. This is seen at postmortem in the large areas of infarction in the spleen caused by thrombosis. The liver is seen to be distended by red blood cells with necrosis of liver cells, but these are often microscopically seen to have areas of necrosis and corresponding thrombosis of the sinusoids. Many of the neurological signs

HISTORY OF MEDICINE IN MINNESOTA

A PSYCHIATRIC BULLETIN IN MINNESOTA OF HALF A CENTURY AGO*

A Chapter of Psychiatric Journalistics

M. K. AMDUR, M.D.

Assistant Superintendent, Longview Hospital†
Cincinnati, Ohio

In November, 1891, the Hospital Medical Staff of the "Second Minnesota Hospital for the Insane" (in 1893, its name was changed to "Rochester State Hospital"), started the publication of a quarterly bulletin "to try to crystalize some of the results of our work in writing." During a two-year period, from November, 1891, to November, 1893, nine issues were published. The "Bulletin" was then discontinued because, "the majority of the profession have not, as yet, attained any great interest in mental diseases." It was indeed a brave undertaking for a small hospital staff; therefore, its fiftieth anniversary seems worthy of note.

In 1891 the "Second Minnesota Hospital for the Insane" had been in existence for about fourteen years. Originally, it was intended as a State Inebriate Asylum when the building was started in 1877. A year later, however, in 1878, by an act of the State Legislature, it was changed to the "Second Minnesota Hospital for the Insane." It was actually opened for reception of patients on January 1, 1879.

In 1891 the superintendent of this Hospital was Dr. A. F. Kilbourne (1858-1934), who was appointed in 1889 and continued to hold this position for forty-five years, until he died in 1934. The First Assistant Physician was Robert M. Phelps (1858-1928), who was mainly responsible for *The Bulletin*, and was its main contributor. He served on the staff of the Rochester State Hospital from 1885 to 1912; since 1892 as Assistant Superintendent. In June, 1892, he married a member of the Medical Staff, Dr. Sarah V. Linton. Both continued in the service. In 1912, Dr. R. M. Phelps was appointed Superintendent of the State Hospital at St. Peter, Minnesota, succeeding Dr. H. A. Tomlinson. He held the superintendency until 1925, when, because of failing health, he resigned and retired from active work, following which, he made his home with his daughters at St. Peter and Faribault, Minnesota. His wife, Dr. Sarah Linton Phelps (1859-1903), served on the Staff of Rochester State Hospital until 1898. She died of tuberculosis in 1903.

Besides these two physicians, in 1891, there were two more assistant physicians: Drs. N. M. Baker (1859-1928) and F. E. Franchere (1866-1934). In 1892 Dr. Franchere resigned and Dr. Eric O. Giere replaced him. He served a short time only, and was replaced by Dr. G. W. Moore, who a year later, in 1893, was replaced by Dr. Cyrus B. Eby (1872-1934). All these physicians participated in *The Bulletin*. Only one of them is alive today: Dr. Moore, who was born in 1870, and is retired at present. Dr. Eric Alonzo Giere, who was born in 1868, practiced in Saint Paul until 1921 when he moved to Minneapolis. His special

*Dedicated to the Fiftieth Anniversary of a psychiatric bulletin of the Rochester, Minnesota, State Hospital.

†E. A. Baber, M.D., is Superintendent of Longview Hospital.

work for many years was general surgery. He had three sons, all of them physicians. The older two were associated with him in the so-called "Giere Clinic." Dr. Giere died February 12, 1942, at the age of seventy-three.

In the Introduction, Volume 1, Number 1a, (November, 1891), the editors of *The Bulletin* had stated:

We, as assistant physicians, organized ourselves into a society to meet once a week for the purpose of discussing types of mental disease, and other matters of interest connected with our work. This (Bulletin) is entirely a private enterprise, maintained at our own expense, we, publishing the results and observations of our work in this way, that they may be useful. Another reason for this work may be found in the knowledge that the multiform misconceptions of our work, and our situation here, are founded directly in a lack of knowledge of the methods and means, as well as the difficulties in our labor. These misconceptions we see to exist everywhere. A physician called here only some days ago, and after going about the "house" asked where the "cells," or the places to keep the "bad ones" were?

As already mentioned, Dr. R. M. Phelps was the "soul" of *The Bulletin* during the two years of its existence. His papers, articles and notes dealt with subjects such as Paranoia, General Paralysis, Strychnine in Inebriety, The Hospital Idea, Influenza (in relation to mental patients), spells or periodicity in Insanity, Renal Diseases Among the Insane, Administrative Topics (such as: The Extent of Administrative Power, Style of Buildings, Types of Dining Rooms, Open Wards, The Proportion of Attendants, Wages of Attendants, Amusements, Occupations, et cetera), Graduation of Responsibility in Insanity, Clinical Studies in Insanity, and so on. Dr. Phelps was a very progressive psychiatrist, conscientious, devoted to his work, and kept abreast with everything going on in psychiatry here and abroad. He was respected and liked by all who knew him. He was active in the county and state medical societies, contributed many papers and articles in the current periodicals, and published textbooks on nursing (one of them in collaboration with his wife).

The other members of the Staff did their share, too. Dr. S. Linton (as already mentioned, since 1892 S. Linton Phelps) discussed in her papers and notes topics such as The Training School for Attendants in Asylums for the Insane, Gynecological Work Among the Insane, Autopsies, Phthisis Among the Insane. It is of interest, that there has existed in the Rochester State Hospital since 1889 a training school for attendants; and since 1890, a training school for nurses. Dr. W. J. Mayo was one of the lecturers on Surgical Procedures. The number of autopsies was comparatively large: about sixteen yearly.

Dr. N. M. Baker wrote on Acute Delirious Mania; reviewed current periodicals, et cetera.

Several outside physicians contributed to *The Bulletin*. Thus, Dr. H. A. Tomlinson, of the St. Peter (Minnesota) State Hospital, discussed Selection, Preparation and Serving of Food to the Insane; Dr. C. Eugene Riggs, Professor of Nervous and Mental Diseases at the University of Minnesota: Some Notes on Scotch Asylums, Some British Alienists, et cetera.

Dr. Elizabeth C. Mallison, Assistant Physician at the St. Peter State Hospital, contributed a paper with a curious title: Report of a Case Exhibiting the Symptoms of General Paralysis, but in which the Postmortem Disclosed Syphilitic Brain Disease (*Sic!*). It is also of interest that Dr. R. M. Phelps discussing general paralysis in one of his papers mentioned: "The operation of trephining for the relief of some cases of this trouble (general paralysis), especially those in which localizing brain symptoms can be found, seems to be a ray of light shining through the general therapeutic darkness which envelopes the subject."

Many interesting items are scattered through the pages of *The Bulletin*; for instance, here are samples of questions offered during examinations to candidates for interns in State Hospitals of Minnesota:

1. Name the various forms of defective mentality, giving a definition of each.
2. Define and illustrate the insane beliefs.
3. Define dementia, naming its different types. Explain what you understand by "acute mania," "primary dementia," and "secondary dementia."
4. Define the different varieties of stupor, naming its classical divisions. Also, describe a typical case of stuporous insanity, giving its prognosis and treatment.
5. Describe a case each of puerperal, lactational and climacteric insanity, giving their prognoses and treatment.
6. Is impulsive insanity invariably attended by the insane beliefs? State at what period of life this predisposition tends to assert itself. Also, state under what conditions the homicidal impulse is most likely to manifest itself in epilepsies.
7. Describe the different types of melancholia. Explain what you understand by "Raptus Melancholicus" and "Precordial Fright." Give the treatment of this disease.
8. Name the varieties of mania. Under what divisions does the moral insanity of Pritchard fall? Explain the meaning of "Folie Raisonante," and give a brief description of "Délire Aigue," with its prognosis and treatment.
9. Explain what you understand by "Folie Circulaire," "Folie á Double Forme," and "Katonía."
10. Describe the best manner of artificial feeding. Also give the dosage and the best manner of administration of such hypnotics as sulphonal, paraldehyde and chloralamid. Also describe minutely the hypodermic use of hydrobromate and hyoscine.

The number of patients of the Rochester State Hospital, about the time *The Bulletin* was started was around 1,050. The following table shows the movement of population for the biennial period July 31, 1890-July 31, 1892:

Total number on July 31, 1890.....	1,034
Out on trial visit, July 31, 1890.....	67
Remaining on July 31, 1890.....	967
Admitted during period.....	625
Returned from trial visit.....	3
Sent away on trial visit.....	327
Eloped	23
Transferred to St. Peter State Hospital.....	50
Died during period.....	135
Discharged as recovered.....	176
Discharge improved	135
Discharged unimproved	24
Remaining in Hospital, July 31, 1892.....	1,058
On trial visit, July 31, 1892.....	78
Connected with Hospital, July 31, 1892.....	1,136

Some amusing points may be selected from the pages of *The Bulletin*. For instance, the following note: "The men are to an extreme degree more capable of organized and good work. I do not hesitate to say that the male side is ahead by at least three times. This is true, too, right through work appropriate for women—bedmaking, dishwashing, et cetera." Of course, this note is unsigned, but the sex of the author is not difficult to guess.

The abstracts of the current medical periodicals were numerous, and included journals, such as *American Journal of Insanity*, *Review of Insanity and Nervous Disease*, *Journal of Mental Science* (London), *Brain* (London), *Alienist and Neurologist*, *Philadelphia Medical News*, et cetera.

Some of the advertisements are of no less interest than the context itself. For instance, an advertisement of an "Instantaneous Electric Lighter," that "a child can operate" (Price \$5.00; with Medical Coil and Hand Electrode, \$5.50). Of

still greater interest, is an advertisement by Smith & Davis Mfg. Co., St. Louis, Missouri, about "Protection Bed for the Insane" (No. 46, Size 6 ft. 3 in. by 2 ft. inside; weight 350 lbs.) It looks like a cage for animals.

It is remarkable that the current medical press practically ignored *The Bulletin*. A few journals had brief notes about its appearance. Only the *Review of Insanity and Nervous Disease* stated, after commenting favorably on its papers: "We are able to commend this new departure in hospital work, and hope that it will be continued by the officers of this institution, and that others may emulate this example. If every institution in America had such a publication, an immense amount of material that is now going to waste, would be saved to the profession."

There is fascination in watching the movement of that lightless multitude, whose names have paled in the twilight, and there is a real and abiding thrill in the perusal of the defunct journals, with their generous and dated rhetoric; their yellowed pages bring back the remote strangeness of other days, and give one the opportunity of seeing one's period in proper perspective. This is perhaps the main value of historical investigations.

EXTRA B VITAMINS WOULD HELP BRAIN WORKERS

Brain workers apparently would be able to do more and perhaps better work, or at least could do their regular work with less fatigue, if they increased their daily ration of B vitamins above the amount required by the average healthy person. Those who perform physical work, however, need not expect any increase in muscular strength or endurance or any lessening of muscular fatigue through taking extra amounts of B vitamins.

These are the conclusions of studies reported by Dr. Ernst Simonson, Dr. Albert Baer and Dr. Norbert Enzer, of Milwaukee.

The Milwaukee scientists gave a large surplus of the vitamin B complex to 12 healthy persons and compared them with 11 people on an ordinary diet. The extra vitamin ration had no detectable effect on any type of muscular activity, neither endurance, recovery, speed, force nor fatigue, but it did prevent fatigue of the central nervous system, which includes the brain.—*Science News Letter*, April 11, 1942.

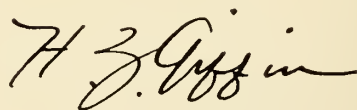

President's Letter

MEDICAL CARE FOR CIVILIANS

THE immediate duty of the medical profession is to obtain physicians for the various services. Minnesota will have to supply about 200 more physicians before January 1. The required number of doctors will have to be obtained in some way. Everyone recognizes that the individual decision is difficult. Physicians are needed at home and they are making a real contribution, both on the home front and in military service, and all are working harder than ever before. It is a problem for each man to solve in communion with his own conscience and according to his own peculiar situation in the community. This subject is covered in an editorial in this issue, which everyone should read.

Hand in hand with supplying physicians for the services goes the task of satisfactory medical care of the civilian population, and it is this that I wish to discuss especially. Articles and editorials are appearing in the lay press calling attention to communities without medical care and jumping quite unjustifiably to the conclusion that group practice, prepayment plans, or some type of state medicine will solve the difficulty, whereas experimental schemes at this time would only throw sand in the gears. In general, through this period the physician should continue to practice as he has been accustomed to practice; more good will be accomplished in this way. However, the physicians of each community and district should meet and devise methods by which each particular district can be properly protected. First, office hours can be arranged for affected towns by doctors in surrounding communities. This has been successfully applied in some places. Second, in some small cities, group effort in dividing the work may be feasible, whereby a doctor who is too busy at a given time may be assisted by others who are not occupied at that time. Third, where the situation cannot be satisfactorily covered, it may be possible through the offices of the State Medical Association to find a locum tenens physician. Some male physicians are physically disqualified for service on completing their internship and no women physicians are taken into military service. These two groups form a pool which will make available for service in various communities about 10 per cent of the physicians who complete their internship each year. Members of these two groups should be asked by the Procurement and Assignment Service to volunteer for civilian service wherever they are needed. The experience in private practice would be valuable to them. Retired physicians are also available for locum tenens service. Fourth, there should be a center of medical information in each county. The office of the chairman of the county Advisory Committee or the local health office might be designated and advertised as such an information bureau. In this way, a record also can be obtained of the actual needs in each district. If people cannot obtain information locally, they should be instructed to write to the offices of the State Medical Association in St. Paul. It is our responsibility to see that medical care is obtained where a bona fide need is demonstrated. In general, it is essential that each small town or community be covered in some way, and second, that doctors in each community meet and consult to see that medical care is being administered satisfactorily.

Medical care for expanding industry and the resulting boom towns is a matter for consultation between the officers of the industry involved, the State Department of Health, local health officers, and officers or committees of the local and state medical societies. Many special problems are involved in each industrial locality, and the situations differ. A special Allocations Committee, working in close association with the Procurement and Assignment Service, is under consideration to provide physicians and surgeons for industrial practice and for civilian needs.

justment of water and electrolytic balance is more prevalent in hospitals with the lesser technical equipment, for the simple reason the hospital population is larger. But even in the highly equipped and specialized hospitals the accurate adjustments of such balances are not always accomplished successfully. The reasons for this are as follows: there is no absolute measure of cardiac efficiency; renal tests may be misleading; the riddle of water flow in the body is still unsolved.

Two years ago at the University of Minnesota there was a round-table discussion on this very subject.¹ Dr. Peters, of Yale, was asked what criteria to use for determining the amount of salt to give. Was it the measure of the vascular bed, was it the measure of the excretion of the kidneys, was it the measure of the amount of gastric fluid which was removed, or was it the clinical picture as a whole? Dr. Peters replied: "It has been asked how we found out that people were hydrated or dehydrated? Well, we can't at the present time. We are peculiarly unable to do so. At present, we must rely on the elasticity of the skin, the general state of the circulation, whether the blood pressure has fallen too far, the serum proteins, etc., but most of all you must look at the patient. No amount of chemistry will eliminate accurate clinical observation."

And again,² "Despite the specific directions which many have offered for determining the amount and character of the fluid requirements of the surgical patient from the hematocrit, blood count, blood or plasma specific gravity, blood or plasma chlorides and plasma or serum proteins, the writer inclines to the opinion of those who hold that the desired information cannot be obtained by any conceivable combination of tests of the state of the blood. However eager one may be to employ "a rational method" in the administration of fluids, the available laboratory aids by no means preclude a consideration of the pertinent clinical factors."

It is for this reason that some of us look askance at the facility and frequency with which the equivocal intravenous route is used. It is for

WATER BALANCE*

THE commonest use of intravenous therapy is to correct water, salt, sugar, plasma and red blood cell deficiencies. All of these deficiencies involve variations of osmotic pressure. The surgeons have contributed largely to the technique of giving fluid intravenously and also to the method of computing how much fluid to give. However, the most common abuse is found in surgical routine by using fluids intravenously without regard to cardiac, renal or osmotic imbalances. To evaluate these factors, a highly developed technical staff is essential. This is not prevalent in all hospitals. It is a safe guess that the need for ad-

*The substance of a discussion entitled "The Use and Abuse of Intravenous Therapy" given in Duluth at the State Medical Meeting, July 2, 1942.

this reason that some of us, who see the spectacle of pulmonary edema following the injudicious use of parenteral fluid, have nothing but the greatest sympathy for the clinician in charge. How can he know how much salt and water to give when such men as Dr. Peters, the eminent student of this problem, do not know.

The ease by which the various drug houses have made available the different apparatus and solutions for intravenous therapy has contributed to the momentum of its widespread use. The tendency to routinize surgical patients in regard to fluids, in which the trend toward standardization has led us, also adds to its promiscuous use.

Then, too, the use of gastric and duodenal siphonage by the nasal tube has also confused the problem. This extremely useful bit of machinery can suck more chlorides out of the intestinal tract in twenty-four hours than can be put back into the body (by veins) in the same time. Its proper use is highly commendable. Its promiscuous use is extremely questionable. To make sieves of postoperatives is a clinical incongruity. I have yet to be convinced that any correctly made intestinal or gastric anastomosis will limit the function of the viscus to the point at least where it will cease to propel fluids down the tract. I am positive that giving fluids by mouth has not been tried sufficiently. The fear of vomiting and distention has kept the clinician from experimenting with this method.

The body fluids are supposed to be in a state of osmotic balance. They are never really so. There is a large margin of recovery if this balance is disturbed. Undue interference on the clinician's part merely adds to the osmotic confusion. To attempt to correct marked variations in a limited time may be dangerous. I am not thinking so much of the strain on the circulating apparatus; I am thinking of the strain on the cellular metabolism of permeable membranes. We seem to forget that these cells are not just porous membranes. They are subject to fatigue just like other cell systems of the body. It is in the older group of patients that the most critical surgical procedures occur. It is in this group that permeable membranes are reduced in area. The sclerosing process is not limited to the blood vessels but involves the capillary beds. It is in this group that intravenous therapy needs more care than in the young. I wish to advance the premise

that fatigue and not cardiac insufficiency alone is a factor in some of the pulmonary edemas we see after use of parenteral fluids. The irreversibility of this condition is very suggestive that injury to membranes may be a factor.

Since we have no absolute measure of cardiac integrity, since the renal tests may be confusing, and since the water activities are still an unpredictable factor, it behooves us to give fluids by vein cautiously and slowly. There is not a single formula for computing the amount of fluid that applies to any single case. Formulas are necessary, but accurate clinical examination of the patient, and judgment, must be the ultimate guide we must use in giving parenteral fluids.

The weighing of the patient daily, as advocated and practiced by Dr. Wangenstein, is probably the best physical means we have today for guidance in giving fluids. But that method too must be supplemented by frequent and accurate clinical observation, with the addition of good clinical judgment. Water taken by mouth differs in its activities in the body from water given by vein. Whenever possible, let us give fluids by mouth.

—H. L. ULRICH.

MALNUTRITION IN INDUSTRIAL WORKERS

WHILE the incidence of malnutrition in our country has been grossly exaggerated in certain quarters, there is undisputable evidence that it does exist to considerable extent in the population at large. This is more evident in the South, particularly among the negro population, as proven by the prevalence of pellagra. However, there is evidence of more malnutrition in the north Atlantic states than in the rest of the country, especially the far West. In addition to those individuals who have clinical evidence of malnutrition there is a considerable percentage of the population who are not properly fed and who would be more efficient if corrections as to kind and amount of food were made in their diets. Important as the subject is in time of peace, it is doubly so in time of war.

The first report of the Committee on Nutrition in Industry of the National Research Coun-

cil has recently appeared and contains much valuable information.

The report calls attention to the experience in England where undernutrition was frequently encountered among industrial workers and where additional feeding resulted in increased output and fewer accidents. While there is little information available at present as to the diet of industrial workers in this country, the Committee on Nutrition in Industry has compiled certain facts and makes definite recommendations.

Industrial health practices in this country have been largely restricted to the prevention and cure of occupational diseases and accidents. Astounding progress has been made along this line. The question of proper nutrition has been given almost no consideration.

That employers are becoming more interested in the subject of better nutrition of their employees is evidenced by the fact that some of them are distributing synthetic vitamins to their employees. This is being done without preliminary study of the nutrition problem of their employees. The Committee does not recommend the procedure. If diets are deficient they should be brought up by natural foods, for "supplementing the diet with synthetic vitamins fails to make provision for deficiencies in proteins, fats, carbohydrates, minerals and the numerous accessory factors which have not been made available in crystalline form, but are nevertheless essential for the maintenance of health." "Diets which are poor enough in one factor to lead to a nutritional deficiency are most likely to be poor in several other factors as well." "In their pure form, vitamins are tools of great precision, invaluable when used by skilled technicians. It would be a tragedy, should their indiscriminate use in unskillful hands throw discredit on their tremendous potentialities for human benefit."

Under the subject of nutrition in general the report calls attention to our poor food habits. Jolliffe has called attention to the fact that the adolescent boy is too likely to stop drinking milk as soon as he dons long trousers. "The amount of candy sold in this country in 1939 was sufficient to furnish 90 calories per capita per day. The amount of alcohol consumed in the United States in 1938 was sufficient to furnish 86 calories per capita per day, and probably exceeded 200 calories per person of alcohol-consuming age." In addition there are the sweetened carbonated beverages which are so popular. All of

these contain no vitamins and are commonly substituted for the calories of essential foods.

Attention is called to our commissary, defective in many respects. Highly milled grain, refined sugar and loss of nutritive value through improper cooking are mentioned.

The Food and Nutrition Board makes specific recommendations. It recommends the enrichment of white flour with vitamin B and iron, the use of whole grain, iodized table salt, oleomargarine fortified with vitamin A, to furnish a cheaper substitute for butter.

Progress in improving the nutrition of the industrial worker will depend on several factors. The ability of the worker to buy the proper food depends on his wages and the cost of proper food. Education in dietary matters is fully as important. The worker must know that he cannot work well on a breakfast of doughnuts and coffee. Industry can do much to educate employees by means of pamphlets, serving substantial meals and the employment of a dietitian in large industrial plants.

As a concrete example of the proper daily consumption of a worker, the Food and Nutrition Board of the National Research Council, gives the following: at least one pint of milk; two servings of potato; two servings of fruit, one of which should be a citrus variety or tomato; two vegetables; one egg; one serving of meat, fish or poultry; a cereal dish (whole grain); whole grain or enriched white bread at every meal; butter or fortified oleomargarine, the remaining calories to be supplied by a choice of vitamin-rich foods.

The study of nutrition of the industrial worker and the population in general is receiving great impetus as a result of the war. Its permanent effect on the health of our people should prove one of the few good results of World War II.

TEST FOR VITAMIN NEED

A simple test for determining who needs vitamins and who is already getting enough of them was announced by Dr. V. A. Najjar and Dr. L. Emmett Holt, Jr., of Johns Hopkins University, at the meeting of the Federation of American Societies for Experimental Biology. The test is made after a twelve-hour overnight fast.

If, during the thirteenth hour, the person tested is still excreting vitamins via the kidneys, he probably has a good surplus and does not need any more than his diet has been furnishing. If he is not excreting them thirteen hours after dinner, he probably needs to take more vitamins. The test so far has been limited to three of the B vitamins—thiamin, riboflavin and nicotinic acid.—*Science News Letter*, April 11, 1942.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the

Minnesota State Medical Association
George Earl, M.D., Chairman

APPEAL TO YOUNG PHYSICIANS

When the House of Delegates met in Duluth the coöperation of the entire medical profession of the state in providing Minnesota's quota of medical officers for the Army and Navy was promised by official action of the delegates.

But applications for commissions subsequent to the meeting have not fulfilled that promise. For that reason, a new appeal directed to available physicians under the age of thirty-seven and to unmarried older men up to age forty-five is now being issued by the Committee on Procurement and Assignment.

No one doubts the essential patriotism and serious purpose of most of the men who have failed, so far, to volunteer their services. There are many compelling individual reasons for delay. Many men in this group are known to be arranging their affairs with the intention of entering the service of the Armed Forces at an early date and the committee is well aware that extraordinary difficulties are involved in dropping an active practice and in adjusting family requirements and responsibilities.

Need Is Urgent

But the problem is not now one of ultimate intentions but of immediate needs. Large scale troop movements and the opening of offensive action in the Pacific and the Atlantic make the immediate need for physicians more urgent than any personal or private problem that may be keeping eligible physicians at home. Minnesota must have its full quota of 900 in the service by December 31 of this year, and we are still more than 200 short of that goal.

The fact that all Army physicians are not constantly employed in care of the sick and wounded does not mean that the full quota is not urgently needed on the line of duty now. Neither firemen nor police officers are constantly employed in fighting fires and pursuing law breakers; but a

full staff must be present and ready for instant action if civilian life is to be safe.

Man Power to Be Conscripted

Selective Service is now exhausting its reservoir of young men and of older men without children. The time for drawing upon all men under forty-five is drawing closer and no exception can be made for physicians, especially in view of the fact that commissions are available to all of them.

There is another aspect of the situation which should serve as a potent stimulus to early action. In the event that the necessary number of physicians and other professional personnel does not apply in time, there is no doubt that Congress will pass special legislation conscripting all man power. It is possible, also, that the President may take the matter of procurement and assignment of physicians entirely out of the hands of the medical profession and restore it to the War Department and the Selective Service system. Either action would place medicine in a sorry light and greatly hasten the day of federal control of medicine.

Do It Now

Letters have been sent by the Committee on Procurement and Assignment to all available physicians under the age of thirty-seven, plus a few others in special categories, who have been classified by their own local committees as available from the point of view of community need.

It is clearly the duty of these young men to enter the service of their country now.

NEW TASK FOR N.P.C.

An editorial appeared in the August issue of MINNESOTA MEDICINE which briefly described recent and proposed activities of the National Physicians Committee. Members of our state association who contributed to the support of this

organization undoubtedly were pleased to know of the progress accomplished. At their recent meeting, the A.M.A. House of Delegates passed a resolution approving the policies and the activities of the N.P.C. The question is often asked why does not the A.M.A. carry on those activities. It is quite obvious to all who are familiar with the organizations of the A.M.A. that it cannot employ methods used by N.P.C. to influence public opinion in regard to the merits of the present form of medical practice nor in the participation of political activities.

Organization Essential

An organization such as the N.P.C. is essential to the protection and continuance of the principles of the present form of medical practice. Although every physician who has been engaged in the actual practice of medicine knows that federal control would lower the quality of medical care, it is difficult as well as costly to give this information to the public. It is almost impossible to compete with the wide facilities available for propaganda by social theorists in the present administration.

N.P.C. is dependent on voluntary contributions by physicians and their friends for funds to carry on its activities. Unfortunately, these have been limited in amount and insufficient to employ the usual methods of publicity extensively.

Only Recourse

An opportunity now presents itself to supporters of the N.P.C. which deserves especial consideration. You are all familiar with the results of the trial in Washington which ended in conviction of the A.M.A. for violation of the Sherman Anti-Trust Act. By an unlooked for interpretation of that law the professions were included with the trades. And by a still more unexpected interpretation, the labor unions were exempt from any implications. This interpretation has been sustained by the Court of Appeals and a plea for reconsideration is now before the Supreme Court. It is quite obvious that if the lower courts are sustained the present methods of conducting medical care and the code of medical ethics will be severely handicapped. Medical organizations will find it difficult to carry on with activities which experience has shown to be in the best interest of medical practice as well as of public health. As Judge Mitchell of the Appellate

Court stated in rendering the verdict, the only recourse left to the professions would be an amendment or reinterpretation of the Sherman Act which would exclude the professions.

With this end in view, the N.P.C. is starting out on a campaign to influence Congress to consider such modification of the Sherman Act. Many of you have received circulars urging participation in this campaign. In Minnesota we are fortunate in having a Committee of the State Association which is experienced in matters of this kind and which can be relied on to do everything possible to accomplish these objectives.

Minnesota Well Situated

Unfortunately, however, there are but few states which are so well situated as we are in respect to legislative matters. Plans are being made so that an active legislative committee will be set up in every state which will function along similar lines to that now existing in Minnesota. It would seem that with the coöperation of the other professions a profound influence can be brought to bear upon the members of Congress to correct what was apparently an oversight in drawing up the original bill passed in 1897. It is self-evident that the authors had no intention of including the professions.

It seemed advisable to start this campaign now in order that our efforts would be recognized prior to the November elections. Careful plans are being made for future action with the advice and coöperation of the other professions. However, we will need most of all the personal support of every physician who is interested in preserving our American form of medical practice. You will be kept informed as to methods by which you can be of aid.

INSURANCE STUDY NEEDED

The problem of medical expense and how to meet it is likely to be with us for a long time.

Hospital expense is now satisfactorily handled for a large number of people by the insurance method and Minnesota is especially fortunate in the wide coverage, here, of group hospital insurance, a coverage which is being steadily extended.

Most discussions about the costs of sickness relate, nowadays, to the possibilities of insurance

coverage by some comparable method for medical expense.

In their attempts to meet this problem, a number of states have placed themselves in a difficult, not to say anomalous position. Several medical associations have secured passage of enabling acts granting them special privileges in the organization of medical insurance plans and the physicians appear to have failed to make satisfactory use of those privileges. One of them is now threatened with amendments to the legislative act which gave the physicians exclusive organizing rights for the reason that medical efforts in the field have not been effective.

Clearly, a very careful study of all aspects of the problem, including the probable support of both doctors and public, is needed before any request for special legislation is made.

Success Is Limited

So far, no single instance of a verified and unquestioned success has come to the attention of this committee where doctors have organized their own plans on a state-wide basis. Medical plans appear to have succeeded only where there is a limited group of doctors working as a unit or where there is an unusual situation such as a hospital center which serves a closely knit industrial community and where errors are easily corrected and control is simple. Organization of larger groups involves difficulties and disproportionate expense.

Physicians should therefore proceed with great caution in this matter. They should make exhaustive studies before arriving at any final conclusion as to whether to leave the field to outside organizations, coöperative or commercial, including the established insurance companies, or whether to step in themselves and take the grief.

Medicine Must Be Ready

Obviously war and the shortage of physicians complicates the problem. Most people agree that new social experiments should not be undertaken now. At the same time, most people also feel that the question of medical expense must be met eventually and that post-war problems, including the return of physicians from the fighting forces and a probable post-war depression, will bring renewed clamor for insurance against medical costs. Organized medicine must be ready for that situation.

MEDICAL BILLS IN CONGRESS

Among wartime measures immediately pending in Congress, physicians will be especially interested in a proposal to amend the Social Security Act so as to provide medical care for recipients of Public Assistance. The bill embodying this proposal, H. R. 7411, was introduced by Representative Coffee of Washington and is now pending in the House Committee on Ways and Means.

It provides for federal grants to assist states in providing medical and hospital care, nurses' services, drugs and other medicines and prosthetic appliances for the aged, the blind and dependent children who are recipients of public assistance under the act and also to needy members of their households. It will be administered by the states according to plans approved by the Social Security Board through a single state agency, the actual care to be supplied either directly through the state agency or a local agency or indirectly through payments by the state or local agency to the doctors or hospitals furnishing the care.

For Major Illness

In Minnesota medical care for recipients of public assistance is now supplied by physicians of the recipients' choice with funds especially allotted for such payments to the recipient. But such funds must come within the limit allotted by law to each recipient. The method works well for minor illness and for predictable medical needs. Costs of major, unpredictable, illnesses must often be paid out of relief funds or on a long term basis out of small monthly allowances or they are borne by physicians and hospitals providing the care.

It is the contention of Representative Coffee that this procedure is unsatisfactory and, under the proposed amendment, "the requirements of the individual for medical care would be met instead through a procedure whereby it is possible to pool the risks with respect to medical care and to set up state and local plans which will assure more effective services for recipients of assistance, which will make such services more easily and promptly available to them, which will make possible more effective use of funds by assistance agencies and which will result in greater fairness to physicians, hospitals and others providing care who now encounter frequent and irri-

tating difficulties with respect to payment for their services."

The principle of payment out of pooled federal and state funds for medical service to recipients of public assistance is already established in Minnesota. As a result of the close coöperation between the Division of Social Service and the Minnesota State Medical Association the recipient of public assistance, like the relief client whose privilege is written into the laws of the state, has free choice of physician for such service. Increasing the funds available for that service would not, in all probability, change the plan already in satisfactory operation in the state.

Open to Abuse

Extension of the service to needy members of the household, might add abuses, and extend the basis of care beyond those for whom the state and federal government should assume responsibility.

Such legislation requires the careful study of all who participate in the plan for care of the needy sick, remembering always that Social Security legislation is the avenue through which advocates of government medicine are most likely to promote their plans.

For Chiropractic

The bill introduced by Representative Tolan of California to permit injured or disabled federal employes coming within the United States Employees Compensation Act to be treated by chiropractic and in chiropractic hospitals, within the scope of the laws of the individual states, is now pending on the Union calendar of the House of Representatives. Bills on that calendar may be brought up for consideration under a special rule approved by the House Committee on Rules. Osteopathic services were made available for these employes under the same limitation under the act of May 31, 1938.

Pharmacy Corps

Establishment of a Pharmacy Corps in the Army is proposed in H. R. 7432 by Representative Durham of North Carolina and by Senator Reynolds in S. 2690 both pending the House and Senate Committees on Military Affairs.

The act would replace the Medical Administrative Corps with a Pharmacy Corps and permit trained pharmacists to replace physicians in

many duties having to do with the purchase, storage, transportation, compounding and dispensing of drugs. It would release many physicians, according to its sponsors, who are now performing tasks which could be handled as well or better by pharmacists.

Veterans

Medical and hospital treatment for veterans of World War II on a parity with veterans of World War I, is proposed in a bill introduced by Representative Rankin of Mississippi. This bill is pending with a favorable committee report and will undoubtedly be enacted, thus setting in motion the increase in activities and facilities in the Veterans' Administration which is likely to go to unimaginable lengths as a result of World War II.

More Government Wards

The possibility of civilian casualties from air raids and sabotage adds other probable thousands to the injured soldiers and sailors who will make up the mounting lists of government wards at the end of this war.

The Civilian War Benefits and War Relief Act of 1942, introduced as H. R. 7415 and pending in the House Judiciary Committee, proposes benefits for complete medical and hospital care for personal injuries sustained by injuries if they arise due to a war risk hazard arising after December 6, 1941.

Cost of medical benefits may be paid directly by way of reimbursement or may be paid to the persons furnishing the benefit, the amount to be dictated in regulations of the Administrator of Federal Social Security. It will be in the province of the Administrator also, according to this bill, to determine whether government or private facilities may be used.

COMPENSATION IN RHODE ISLAND

The first state sickness compensation act has just been passed in Rhode Island.

It provides for weekly benefit payments to employes who are ill in exchange for contributions of one per cent of their pay to be taken out of their wages in the same manner and under virtually the same administrative setup as for other contributions made under the Social Security act.

Amounts of weekly benefits range from a low of \$6.75 for the lowest paid workers to a high of \$18.00 for those receiving three thousand dollars a year or over.

Cash benefits for illness have been recommended repeatedly by the President and backers of the present social security legislation and the workings of the Rhode Island plan will undoubtedly be watched with interest.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

Julian F. Dubois, M.D., Secretary

St. Paul Woman Sentenced for Unlawful Practice of Healing

Re: State of Minnesota vs. Assunda (Sue) Willner

On August 4, 1942, Assunda (Sue) Willner, thirty-two years of age, 343 West Central Avenue, Saint Paul, Minnesota, entered a plea of guilty to a charge of practicing healing without a basic science certificate. After a searching inquiry into the facts, Judge Hugo O. Hanft of the District Court of Ramsey county sentenced the defendant to one year in the county jail and placed her

on probation for the next year on the following conditions:

1. Refrain from practicing healing in any manner whatsoever;
2. Refrain from having any patients in her home;
3. Refrain from having any old age assistance recipients in her home as boarders, roomers or otherwise.

The defendant was arrested July 20, 1942, by Saint Paul police after it had been reported that the defendant had attempted to perform an abortion on a married woman living at White Bear Lake. It was alleged that the attempt took place in April, was a failure and that the same woman had returned for the same purpose. The "patient" gave a written statement in which she claimed she paid the defendant \$35 and was "examined" by her. When police went to the home of the defendant they found several old age assistance recipients, a waitress from Minneapolis and the "patient." The Minneapolis girl gave a statement in which she claimed that she had gone to the home of the defendant to have an abortion performed and that she had paid down \$15 but had not had any treatment.

The defendant has had no medical training of any kind but had made inquiry in March about obtaining a license for a "rest home." She was advised by the State Department of Health that they would not issue one for her place. Judge Hanft denounced the defendant's activities and told her that one single complaint in the next year would result in her probation being revoked and her going to jail to serve her sentence.

In Memoriam

George Ketcham Hagaman

Dr. George Ketcham Hagaman, prominent pediatrician of Saint Paul, died at Miller Hospital July 11, 1942, following an illness of about three months.

Dr. Hagaman was born December 9, 1875, at Pennington, New Jersey, the son of Joseph Hagaman and Mary Ketcham Hagaman. His parents moved to Saint Paul in 1887. He graduated from the Saint Paul Central High School in the class of 1893 and was then employed by the Great Northern railroad company until the fall of 1899, when he entered the medical department of the University of Minnesota, graduating in the class of 1903. He served as intern in the City and County Hospital of Saint Paul from June, 1903, to June, 1904. Following his internship he moved to Anoka, Minnesota, where he engaged in general practice until 1918. In 1909, he did postgraduate work for a short time in Vienna. In 1918, he spent some time at the University of Minnesota specializing in pediatrics. He then came to Saint Paul where he became associated with Dr. Walter R. Ramsey, and later with Dr. Alexander Stewart. Together they formed the Children's Clinic of Saint Paul which existed until 1928, when the Children's Hospital was built. Dr. Hagaman then established an office by himself and continued so until his death.

In 1904 he married Mary Wilson Fagundus who, with three children, survive him. The children are, George K. Hagaman, Jr., of Pittsburgh, Mrs. Wm. Ives of Baltimore and Mrs. Townsend Corning of Radburn, New Jersey. Four grandchildren also survive.

Dr. Hagaman, at the time of his passing, was a member of the Ramsey County Medical Society, the Minnesota and American Medical Association, and the American Academy of Pediatrics. For many years he served on the teaching staff of the University of Minnesota. In 1937, he served with distinction as president of the Ramsey County Medical Society.

Dr. Hagaman was a successful general practitioner and became one of our leading pediatricians with a large following. He was, in every sense, a physician. An indefatigable worker, he gave of his time and best efforts to all his patients, regardless of their financial status. He was a close observer of patients, and was endowed with a remarkable memory for details of condition of patients, of differential diagnosis and treatment. His genial personality and excellent judgment, his kindness and honesty, combined with an unusual knowledge of medicine, made him outstanding in his specialty.

SILICOSIS AND TUBERCULOSIS

The relationship of occupation to tuberculosis may be considered from two points of view. The first, which has already been discussed in this column, relates to the possibility of the discovery of tuberculosis by survey methods among large groups of workers. The second phase of this problem, which is an important responsibility of industrial medicine, is occupying much thought on the part of public health officials. It relates to the development of tuberculosis as the direct result of an occupational hazard. Whereas in the first group we are concerned with the detection of tuberculosis and the prevention of its spread, in the second group we are interested primarily in the possibilities of prevention of tuberculosis in the individual as a result of the work he is doing.

Silica-free Dust

Tuberculosis as a direct result of occupation is almost entirely concerned with the factor of dust inhalation. As such it has been studied for a great many years, yet the problem is so complex and has so many variables that it is foolhardy to be categorical or dogmatic about it. Certain facts are reasonably well established and give a working basis for further investigation. It seems reasonably certain, for example, that dusts which do not contain substantial amounts of free silica, noxious gases, and poisonous metals do not in themselves tend to increase the incidence of tuberculosis amongst the workers exposed to them. No matter how uncomfortable the working conditions may be, regardless of what other side effects such dusty atmospheres may have, certainly they do not appear to have any bearing on the development or reactivation of a tuberculous infection. It is a common experience to hear the question raised as to the effect of dust in cement plants, flour mills, sawmills, and many other industries of a similar nature. It is well to know that there is no good evidence to indicate that permanent effects result from such occupational dusts. The degree of fibrosis in the lungs is minimal, and the incidence of tuberculosis is no greater among such workers than in the rest of the population.

Tuberculosis Increased

In the case of occupations producing dust containing large quantities of free silica, the picture is radically different. Beginning with the very earliest investigations amongst metal miners up to the most modern experimental studies, the finding that the lung fibrosis resulting from certain types and quantities of siliceous dust, now usually called silicosis, increases the tendency to develop tuberculosis, has been well borne out.

It is true that statements to the contrary have been made in this state as well as in others, but they have usually been based upon a small personal experience and incomplete observation. Too often, unfortunately, the opinions rendered have been overly influenced by the medicological considerations which so commonly becloud this whole subject. There seems no doubt that silicosis increases the incidence of tuberculosis in its victims. This is true whether the worker acquires the silicosis in the granite quarries of Barré, Vermont, where the incidence of tuberculosis is 130 times that of the remaining population, in marble quarries, in metal mines, or in the many other occupations in which the worker is exposed to dust containing free silica.

Variables Should Be Studied

In the consideration of an increased incidence of tuberculosis due to inhaled siliceous dust, numerous factors must be studied. The concentration of the silica, the character of the dust, the size of the particles, the length of exposure, and the presence of carriers of tuberculosis in the group, all are important factors in determining whether or not silicosis will occur and in turn whether the silicosis will increase the incidence of tuberculosis. Furthermore, there are many other variables, not all well understood, which make it difficult to draw conclusions for all localities based upon studies in any one area.

Fortunately in Minnesota the silicosis hazard is not an extensive one, nor does it seem to have had any marked effect upon the incidence of tuberculosis. We know that silicosis occurs to a more or less degree amongst two particularly large groups of workers in this state. Amongst the workers in the quarry industry and amongst the laborers in the iron mines some degree of

(Continued on Page 748)

*I like S-M-A!**

IN INFANT FEEDING ... IT SAVES MY TIME

- Directions on how to mix and feed S-M-A can be explained to the mother and nurse in two minutes.
- S-M-A is more easily digested by the normal infant because of the all-lactose carbohydrate and the unique S-M-A fat.
- With S-M-A nothing is left to chance. All the vitamin requirements, except ascorbic acid, together with additional iron are included in S-M-A in the proper balance, ready to feed.
- S-M-A fed infants compare favorably with breast-fed infants in growth and development.

Prescribe S-M-A!

*S-M-A, a trade mark of S.M.A. Corporation, for its brand of food especially prepared for infant feeding—derived from tuberculin-tested cow's milk, the fat of which is replaced by animal and vegetable fats, including biologically tested cod liver oil, with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and physical properties.

S. M. A. CORPORATION • 8100 MCCORMICK BOULEVARD • CHICAGO, ILLINOIS

Infant Formulas

EFFECTIVE formulas provide two-thirds of the total calories in milk and one-third in added carbohydrate. Whatever milk is indicated usually may be modified safely with KARO Syrup.

Free to Physicians

"Infant Feeding Manual For Physicians" is a concise, helpful monograph containing specific information and tested Karo feeding formulas. Sent postpaid.

(Continued from Page 746)

silicosis is likely to be present, at least in a small percentage of the group. Whether this has produced any increased incidence of tuberculosis in these areas has never been accurately ascertained by careful observation.

Incidence in Minnesota

Unfortunately too many of the opinions in this matter have been formed under the stress of legal procedures rather than as a result of any extensive study. It seems perfectly clear that the incidence of silicosis amongst the workers in metal mines in Minnesota, for example, is relatively small, but just what the incidence is, there is little evidence to show. It seems clear also that there are striking differences in the reactions of different groups in various localities to silica inhalation. Because of this, it is impossible to draw any conclusions about any particular industry without a fairly serious investigation of the local conditions within that industry.

One of the tasks which the committee on industrial health and occupational diseases and the State Board of Health has before it is the determination of the real facts in this situation. Clarification of our knowledge as to local conditions would be extremely useful in eliminating many controversial statements which might be undertaken to limit in so far as possible this type of occupational hazard. Such a program of investigation may prove to be a long and arduous one but will repay all the work put into it. In the struggle against tuberculosis, we must concentrate on any source of the disease. In the cases of tuberculosis induced by silicosis, the possibilities of its prevention are fruitful and certainly should be undertaken when the opportunity presents itself.

LEO G. RIGLER, M.D.

CLINICAL-PATHOLOGICAL CONFERENCE

(Continued from Page 731)

which are varied in their location and type of lesion, are seen to be caused by lesions which are primarily intravascular with congestion of sickled red cells and resulting thrombosis. Therefore, any process slowing circulation may convert sicklemia to sickle cell anemia. For treatment, he believes it is necessary to combat circulatory stasis. Many unexplained surgical deaths in negroes can be explained on this basis. The anesthesia results in a slowing down of blood flow and anoxemia. The sickle cells become conglutinated and areas of thrombosis with fibrosis and necrosis occur. Most of the deaths, however, are due to secondary infection. The treatment of sickle cell anemia as far as our present knowledge of the condition is concerned, is symptomatic. Splenectomy has been tried without success. It has been said, "Why do splenectomy when the patients eventually splenectomize themselves."

CORRESPONDENCE

To the Editor:

Our attention has been called to your editorial on "Dilaudid Addiction" in the July issue of MINNESOTA MEDICINE. Of course, we are vitally concerned, as Dilaudid is a product of our manufacture, and therefore would like the privilege of commenting on this editorial.

We certainly agree with you that Dilaudid should be prescribed with care because of its addictive properties and have always recommended this in our advertising literature. Perhaps you would be interested in the folder which is now in current use, a copy of which is enclosed. In it the statement reads:

... "Dilaudid, which is a morphine derivative, should be used with the same precautions as other opiates to avoid respiratory depression and the possibility of addiction." ...

So far as we know, there is nothing in the literature to indicate that Dilaudid is more addictive than morphine. In fact, there are workers who have stated that they believe Dilaudid leads more slowly to addiction than morphine, and that addicts can be taken off the drug more easily than from morphine, but we do not make any claims to this effect. Perhaps the earliest

mention of the addictive properties of Dilaudid in the American literature was that by Paul Wolff in the address which he gave at the 1932 session of the American Medical Association in New Orleans (Jour. A.M.A., 98:2175, (June 18) 1932). Wolff was Secretary of the Committee of Experts on Narcotics of the League of Nations and based his remark that

... "It has been shown that it (Dilaudid) leads more slowly to habituation and addiction, and its devotees are therefore more easily cured." ...

on the basis of over nine years experience with Dilaudid by European observers.

There are several interesting studies on the development of tolerance in experimental animals, in which Dilaudid has been compared with other opiates. Among these are Stanton (J. Pharm. & Exper. Therap., 56:253, (Feb.) 1936), Eddy and Reid (J. Pharm. & Exper. Therap., 52:468, (Dec.) 1934), and Seevers (J. Pharm. & Exper. Therap., 56:157, (Feb.) 1936). In all of these studies, there is no evidence that Dilaudid is any more habit forming than morphine, and Seevers went so far as to say that, in his studies on monkeys, he found that signs of abstinence were much more severe with heroin and morphine than with Dilaudid, when doses comparable to those used in clinical medicine were administered.

Naturally, the United States Public Health Service is interested in the addictive properties of all opiates and have carried out several studies in which Dilaudid was included. There is nothing in any of their publications

which would lead us to believe that Dilaudid is any more addictive than morphine.

We should again like to emphasize our stand that we have recognized the fact that Dilaudid is addictive in our advertising and recommend that it be considered in the same light as morphine, so far as this phase of its action is concerned.

Yours very truly,

BILHUBER-KNOLL CORP.

Fred B. Western, M.D.

To the Editor:

At the recent meeting of the Minnesota State Medical Association at Duluth, I noticed a booth assigned to the St. Louis County League for Planned Parenthood, and also two commercial "technical" exhibits of contraceptives including one movie. I feel sure that the State Medical Association has never endorsed the birth control movement.

Now that the proponents of the movement have had an opportunity to present and press their cause before the Association, it is only a matter of fairness that the opponents, of whom I am one of many in the Association, should have an opportunity to present at least some argument. I do not rate my own ability highly, but, while at the Duluth convention, I ran across an article in the June 27 number of *America*, entitled "Race Suicide Means Sheer Loss of Nerve"; its approach to the matter is so refreshing that I wish to present at least the gist of it to the Association:

"Thermopylae was much in the news a year ago. The Greeks were making another glorious, if this time futile, stand, and echoes of Thucydides came back to some of us erstwhile classicists as we followed the dispatches. Yes, there was a 'glory that was Greece,' and it seemed in those dark days to glow with an especial meaning for us.

"But there was once a disgrace that was Greece, too, in the days that followed the heroism of Thermopylae, and that

disgrace has a terrifying meaning for us today, if we can read the pages of history clearminded enough to see it.

"It was a little book by T. R. Glover, *The Influence of Christ in the Ancient World*, that sent me back for another look at this dark period in the history of a declining Greece. It sent me back to the pages of a historian of the times one Polybius, and in the thirty-sixth book of his *History* I found the foreboding message for today. Says he:

"In our own time, the whole of Greece has been subject to a low birth rate and a general decrease of the population, owing to which cities have become deserted and the land has ceased to yield fruit, although there have neither been continuous wars nor epidemics. . . . Men had fallen into such a state of pretentiousness, avarice and indolence that they did not wish to marry, or if married, to rear the children born to them or at most, as a rule, but one or two of them, so as to leave these in affluence and bring them up to waste their substance and so the evil rapidly and insensibly grew."

"Race suicide, birth control, or, to use modern jargon about a very old depravity, planned parenthood, even in the testimony of this pagan writer, was rotting the vitals of Greece, and the Romans came and conquered.

"Now, one eminent authority on those times, Professor Bury, claims that 'loss of nerve' was the mark of that age, and that this race suicide was a sure sign of it. As T. R. Glover comments: 'Life grew more and more of a riddle, and solitary hearts lost faith and lost nerve, and hegot no songs and few children.'

"Now, compare this brief recounting of an historic calamity with a report emanating from London on June 7. Lord Horder, the King's physician, acknowledges the existence of the white race's birth-rate problem and attributes it to 'passive resistance in the production of new citizens. . . . In short, there has been a strike.'

"But there has been no strike against human affection. It still flows in human hearts, only now it is timid and misplaced: Britain, it was brought out in the report, now has 1,500,000 more pet dogs than she had fifty years ago. . . .

"What does this say but that our age, or at least the planned parenthoods of it, are suffering from that same 'loss of nerve' that eventually ruined an ancient and marvelous culture? Far from being a progressive or triumphant movement, birth control is a cringing thing, whose motive force is fear—fear of the economic burdens that children bring, fear of the world into which they must be born, fear of the responsibility their training entails. . . .

"The acceptance of life in its fulness means responsibility, personal responsibility. But that is not a sad thing, it is not depressing, challenging though it be. Herbert Agar, writing

Your Answer—

Solution of Estrogenic Substances (in Peanut Oil)

Mercy walked with the discovery of the remedial action of estrogenic substances. It walks today . . . where carefully regulated laboratories produce and distribute these products . . . And most of all, where competent physicians—alert to symptoms—administer estrogens for these various conditions: natural and artificial menopause, gonorrheal vaginitis in children, kraurosis vulvæ, pruritis vulvæ . . .

on 'The Truth Is Good News' in the May *Harper's*, reminds us that 'we cannot win the war without rising above the national responsibility which has given Hitler his advantage over us.' And harking back over the centuries, Mr. Glover discovers that the thing that above all ruined ancient society was the increasing withdrawal of responsibility from the individual.'

'Certainly, one responsibility that modern America is more and more sloughing off in despair, is that preeminently personal one of rearing children generously and gratefully. It cannot continue, if this nation is to continue to be great, not merely in matter of numbers, but above all in the fiber of its national character. For, as the student of the past whom we have been quoting reminds us: 'Men are made great by great responsibilities.' . . .

'Furthermore, with this decline of backbone to live up to duties (merely of good citizenship, let alone of morality) goes the whole basis of democratic life. Have you ever mulled over the striking parallel between the slump in family life (birth control, divorce) and the lessening of intelligent interest in our political life? To vote intelligently is a duty, and most duties ring a burden, but if we as a nation have given up hope in such an intimate thing as the family, how can we keep up hope in that much more impersonal thing, the welfare of the country? . . .

'Birth control is a defeatist propaganda disseminated by those who have lost nerve. Its wide acceptance is a certain sign that a nation is rotting from within and it can be as certain for twentieth-century America as it was for pre-Christian Greece. . . . It is unalterably opposed to the daring and adventurous spirit that has made this nation, and which, under God, must keep it.'

THEODORE H. SWEETSER, M.D.

MEDICAL BROADCAST FOR SEPTEMBER

The Minnesota State Medical Association broadcasts weekly at 10:15 o'clock every Saturday morning over station WCCO, Minneapolis and St. Paul, and at 11:30 o'clock over Station WLB, University of Minnesota. Speaker: William A. O'Brien, M.D., Director of Postgraduate Medical Education, Medical School, University of Minnesota.

September 5—Swimmers' Itch
September 12—Poison Ivy
September 19—Hay Fever
September 26—Orthodontia.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

The annual meeting of the Southern Minnesota Medical Association will be held in Rochester, Monday, September 28, with a full day's program.

The morning session will be devoted to papers of general interest to the practitioner. The afternoon session will be a symposium on civilian and industrial casualties, consisting of short, to-the-point papers on shock, burns, intravenous therapy, chest wounds, abdominal wounds, fractures, gas gangrene of the extremities, heat stroke, and similar topics.

All interested physicians are cordially invited to attend this meeting.

A NEW, LIGHTER, SIMPLER SPENCER Maternity Support

INDIVIDUALLY DESIGNED FOR EACH PATIENT

Ideal For Young Women Having First Child

New Spencer Maternity Support. Lacers at sides adjustable to increasing development.

As light and flexible as the foundation garments young women have been wearing, so they *willingly* cooperate.

Can be slipped on in a jiffy and adjusted by means of hooks and eyes. No *daily* adjustment required.

It provides these benefits:

- Gently supports lower abdomen, providing freedom at upper abdomen.
- Improves posture—gives neat, smooth figure-lines.
- Relieves backache and fatigue; relieves nausea when not pathological. Guards against sacro-iliac sprain or other injury—helps safeguard child.
- Improves circulation and elimination, thus lessening tendency to toxemia, edema, hemorrhoids, varicosities and general malaise.

- Provides protection against stretching and weakening of abdominal muscles, lessening likelihood of ptosis of abdominal organs from lowered intra-abdominal pressure.

hood of ptosis of abdominal organs from lowered intra-abdominal pressure.

Easily laundered—exceptionally durable. Saves patients money, as it is suitable for wear after childbirth, too. Designed of *non-stretchable* fabric. (Spencer designers have never used rubber to make a corset fit or as a means of support.) Every Spencer is *guaranteed* never to lose its shape. Ordinary supports soon stretch out of shape and become useless before worn out.

For service at patient's home, your office or hospital, look in telephone book under "Spencer Corsetiere" or write direct to us.

Address

OF GENERAL INTEREST

Dr. and Mrs. John L. McKelvey of Minneapolis are the parents of a son, Robert, born June 22.

* * *

Dr. and Mrs. Alphonse E. Walch of Minneapolis are the parents of a daughter, Carolyn Mary, born June 24.

* * *

Dr. C. L. Sherman of Luverne has accepted an appointment as chairman of the medical division of the Rock County Civilian Defense Council.

* * *

Leonard Telford Carlson, Jr., is the name of the young son of Dr. and Mrs. Leonard T. Carlson of Minneapolis, born August 22, 1942.

* * *

Dr. J. Arnold Malmstrom and Dr. O. E. Sarff of Virginia have dissolved partnership in the Malmstrom-Sarff Clinic. Both will continue to practice in Virginia.

* * *

Dr. Samuel Wells, fellow in the University Hospitals, Minneapolis, and Miss Helena Bengtson of Minneapolis were married July 18.

* * *

Dr. Ralph V. Platou, who has been associated in practice with his brother, Dr. Erling S. Platou, has gone to New Orleans to become acting head of the department of pediatrics at Tulane University.

* * *

Dr. Donald Cowan and Dr. Philip D. Kernan of the Students' Health Service, University of Minnesota, spent the first two weeks in August at the Minnesota State Guard training camp at Camp Ripley.

* * *

Dr. William C. MacCarty of Rochester addressed the meeting of the International College of Surgeons in Denver, July 17, on the subject "Diagnostic and Prognostic Surgical Pathology."

* * *

Drs. Berenice and Cecile Moriarty will give a reception and silver tea at their new home, 63 Otis Avenue in Saint Paul, September 20, as a benefit for the Cancer Hospital, which is under the direction of Our Lady of Good Counsel. Hours are from 5 to 8 p.m.

* * *

Dr. Jay Arthur Myers of Minneapolis was chosen president-elect of the American College of Chest Physicians during its recent annual meeting in Atlantic City, and Dr. G. A. Hedberg, Nopeming, was elected a Governor of the College.

* * *

Dr. Robert L. Meller has taken over the offices and practice of Dr. Alexander Blumstein, Minneapolis neuro-psychiatrist who is now in active service. Dr. Blumstein, who has been commissioned a Major, is stationed with the Army Medical Air Corps at Mather Field, Sacramento, California.

Dr. Meller, a graduate of the University of Minnesota Medical School, has his offices at 1541 Medical Arts Building.

* * *

Dr. Arthur E. Karlstrom resigned his position as director of hygiene and health education with the Minneapolis public schools, effective August 17, in order to devote his full time to private practice. Dr. Karlstrom, a pediatrician, has offices at 1600 West Lake Street.

* * *

Two Wells physicians have entered the service of the Navy Medical Corps. Dr. P. W. Demo, who has been commissioned a Lieutenant Commander, reported for duty in Washington, D. C., August 10. Dr. M. P. Virnig, commissioned a Lieutenant, second grade, expects to be in active service before the middle of September.

* * *

Dr. Christopher R. Dix, formerly of Rochester, has opened his offices in Milwaukee, Wisconsin. A graduate of the University of Wisconsin Medical School and the University of Minnesota Postgraduate School, Dr. Dix received the second M.S. degree in Plastic Surgery to be granted in this country. He has been associated with the Mayo Foundation and Clinic since 1937.

* * *

A Red Cross Nutrition Council has been formed in Minneapolis to unify all efforts along food lines. The first general meeting of the council was held at the Curtis Hotel, August 10. Dr. W. A. O'Brien of the University of Minnesota Medical School, discussed the purpose of the council. Among organizations represented was the Hennepin County Medical Society. The council will meet the second Monday of each month.

* * *

Dr. Charles J. Hutchinson, lieutenant commander, U.S.N., is the medical officer in the United States Navy Electricians School at the University of Minnesota. He formerly was assigned to the Minneapolis navy recruiting office, but was detached from duty there four weeks ago to take charge of medical care of students in the Electricians School, one of a number of such schools located at the University. It is expected that 500 men will be taking training there.

* * *

Drs. C. W. Mayo and C. K. Maytum of Rochester, Lieutenant Colonels on the staff of the 71st General Hospital, were in Washington, D. C., last month on a twenty-eight-day tour of duty at the Army Medical Center.

Dr. Mayo is in charge of the surgical section and Dr. Maytum of the medical section of the 71st General

hospital which is sponsored by the Mayo Clinic and the Mayo Foundation.

* * *

Dr. C. L. Farabaugh, for the past three years a fellow and resident in Ophthalmology and Otolaryngology at the University and the Minneapolis General Hospital, has opened offices at 820 LaSalle Building, Minneapolis, for the practice of this specialty.

Previous to entering the fellowship, Dr. Farabaugh practiced medicine in Owatonna, Minnesota, for a number of years. He served in the U. S. Army as a member of the A.E.F. in France during 1918 and 1919.

* * *

Dr. O. E. Sarff of Virginia, formerly associated with Dr. J. Arnold Mahmstrom in the operation of the Mahmstrom-Sarff Clinic at Virginia, is reestablishing his practice in that city and has opened offices for private practice. Dissolution of the clinic was announced several weeks ago when Dr. Sarff received notice that he was to receive a commission in the medical service of the United States Army Air Force. Since then Dr. Sarff has been classified as essential to civilian life in Virginia with priority in the reassembling of necessary medical equipment.

* * *

A new appointment to the full-time staff of the students' Health Service, University of Minnesota, announced by Dr. Ruth Boynton, director, is that of Dr. Ramona Todd, who recently completed her internship at the University of Minnesota Hospital. Dr. Todd was formerly on the staff of the University of Iowa department of bacteriology. She received her Ph.D. from that university.

Appointment of Dr. Myron Weaver, director of the Health Service at Knox College at Galesburg, Illinois, and former director of the Health Service at Carleton College, Northfield, as a staff member was announced earlier this summer.

* * *

Dr. Irvine McQuarrie, head of the pediatrics department at the University of Minnesota Medical School, is giving a series of lectures in California and Arizona this month. He was in Oakland, September 3 and 4, to address a group of Oakland pediatricians.

On September 10 and 11, he will present papers before the meeting of the Southwestern Pediatrics Society at Los Angeles. At the evening session of this society, September 10, he will speak on his "Pediatrics Experiences in China."

On September 14, Dr. McQuarrie will be in Phoenix to address a meeting of the Arizona Pediatrics Society.

To assist in opening the first Kenny unit in the country, Dr. John Pohl of Minneapolis, Sister Elizabeth Kenny, and Dr. William A. O'Brien, director of post-graduate medical education at the University of Minnesota, were in Des Moines recently. The Unit was opened by the Iowa Lutheran Hospital in that city.

Highlight of the opening was a testimonial dinner for Sister Kenny held at the Fort Des Moines hotel, July 29. More than 500 persons, including physicians, nurses and lay persons interested in crippled children

Additional promotions in the University of Minnesota Medical School, announced by Dr. H. S. Diehl, dean follow:

Dr. Lawrence R. Boies, promoted from clinical associate professor and director of the division of otolaryngology, to clinical professor and director of the division.

Dr. Walter P. Gardner, from clinical instructor to clinical assistant professor of medicine.

Dr. Herman Kabat, from instructor in physiology to assistant professor.

Dr. John J. Boehrner, from instructor of preventive medicine and public health to assistant professor.

Dr. Louis Sperling, from clinical instructor of surgery to clinical assistant professor of surgery.

Dr. John H. Moe, from clinical instructor in orthopedic surgery to clinical assistant professor.

Dr. John F. Pohl, from clinical instructor in orthopedic surgery to clinical assistant professor.

* * *

Several Minnesota men will be among the speakers at the one hundred and first annual meeting of the State Medical Society of Wisconsin to be held in Milwaukee, September 14-16. Among them are:

Dr. Wallace H. Cole, Saint Paul, "The Kenny Treatment of Anterior Poliomyelitis."

Dr. Arlie R. Barnes of Rochester, "Diagnosis of Pathologic Conditions of the Heart."

Dr. Stuart W. Harrington, Rochester, "Constricting Pericarditis."

Dr. Wesley W. Spink, Minneapolis, "The Clinical Applications and Complications of the Sulfonamides."

Dr. Edgar A. Hines, Jr., Rochester, "Normal Range and Hereditary Factors in Hypertension."

Dr. Elexious T. Bell of Minneapolis, "Pathology of Hypertension." Dr. Bell will also preside over a round table discussion on the "Etiology of Hypertension."

Dr. Edward H. Rynearson, Rochester, "Actual Clinical Disturbances of the Endocrine Glands."

Dr. Herman O. McPheters, Minneapolis, "The Present-Day Treatment of Varicose Veins."

Dr. Thomas L. Pool, Rochester, "The Treatment of Urinary Tract Infections with the Sulfonamide Group of Drugs."

Minneapolis physicians now in the service include the following:

Major Daniel H. Bessessen has been commissioned and is now on duty at Fort Douglas, Utah.

Major Donald W. Pollard has been ordered to duty at Lawson General Hospital, Fort Benning, Georgia. Major Pollard has been granted leave of absence for the duration from his duties as Superintendent of the Minneapolis General Hospital.

Captain Frank C. Andrus has orders to report to

the Army Medical Center, Washington. During his absence, his work as Pathologist at MGH will be handled by A. J. Hertzog, St. Barnabas Hospital, and Stanley Lofsness, Teaching Fellow at the University.

Captain U. Schuyler Anderson is under orders to report to the Boca Raton Aviation Base, Florida, early next month.

Captain Louis Sperling has reported for duty at Fort Snelling.

Captain Arshavir Ignatius has been commissioned and sent to Atlanta, Georgia, for duty. Captain Ignatius, formerly District Surgeon, CCC, is a Visiting Member.

First Lieutenant Melvin B. Sinykin has been ordered to duty at Fort Douglas, Utah.

Major Allan G. Rewbridge has been assigned to duty with an air corps unit at Fort Douglas, Utah.

Captain Sigsbee R. Seljeskog and First Lieutenant Donald B. Simonson have been assigned to duty at Fitzsimons General Hospital, Denver.

First Lieutenant Harvey J. Brekke's orders took him to Camp Carson, Colorado.

Dr. C. J. Holmberg is head of the ear, nose and throat division of the new medical corps unit recently organized at Camp Custer, Michigan. He holds the rank of Major.

* * *

Among physicians in the state who have been called to service with the United States Army the past month are the following:

Dr. E. V. Allen of Rochester, upon completion of a six weeks' assignment in the office of the Surgeon General and in the Walter Reed Hospital, Washington, D. C., will become medical consultant and coordinator of professional services of the Seventh Service command with headquarters in Omaha. He is a Lieutenant Colonel in the Army Medical Corps.

Dr. Frederick P. Arny of Preston has been commissioned a First Lieutenant and reported for duty August 21.

Dr. Norman Carlson of Melrose, First Lieutenant, is located at Carlisle Barracks, Pennsylvania.

Dr. George M. Ruggles of Forest Lake, Captain, reported for duty August 24.

Dr. Harold Stoen of Milan is in service at Colorado Springs, Colorado.

Dr. Phillip S. Hensch left Rochester August 6 to report for active duty with the medical corps, having been commissioned a Lieutenant Colonel. After preliminary assignment at Fort Custer, Michigan, he expects to be transferred to the station hospital at Camp Carson, Colorado Springs, Colorado.

Dr. E. C. Paulson, who has been associated with Drs. Parson and Parson at Elbow Lake the past year, has entered the Army Medical Service and is stationed at the Air Base Hospital, Portland, Oregon.

Dr. James A. Blake of Hopkins has enlisted in the Army with the commission of First Lieutenant. His father, Dr. James Blake, will continue the practice at the Blake Clinic, in which the two have been associated.

Dr. Wallace Beckman of Richfield is now stationed at a camp in Washington state.

Dr. J. E. Haes of Vernon Center has been accepted

Effective, Convenient and Economical

THE effectiveness of Mercurochrome has been
demonstrated by twenty years' extensive clinical use.

For the convenience of physicians Mercurochrome
is supplied in four forms—Aqueous Solution for
the treatment of wounds, Surgical Solution for
preoperative skin disinfection, Tablets and Powder
from which solutions of any desired concentration
may readily be prepared.

Mercurochrome

(H. W. & D. Brand of dibrom-oxymercuri-fluorescein-sodium)

is economical because solutions may be dispensed
at low cost. Stock solutions keep indefinitely.

Mercurochrome is accepted by the
Council on Pharmacy and Chemistry of
the American Medical Association.

HOSPITAL NEWS

The city of Redwood Falls last month purchased the
Redwood Falls hospital from Dr. T. E. Flinn and
Dr. J. Gordon Cole.

* * *

According to an announcement made by Lt. Comm.
Douglas Campbell, a 250-bed hospital is soon to be
erected at Wold-Chamberlain naval air base. The site
of the new hospital consists of the area included in
three double-length city blocks along Fifty-ninth Street
and the present north boundary of the field.

* * *

The Windom Hospital Association, through a me-
morial donation of \$500 received from the estate of
Peter J. Velve of Jackson County, will furnish a
double room in the hospital.

* * *

The annual meeting of the staff of the St. Cloud
Hospital was held in that city, July 14. Speakers in-
cluded Raymond Amberg, superintendent of the Uni-
versity of Minnesota Hospitals, and Dr. William A.
O'Brien, director of postgraduate medical education at
the University of Minnesota.

* * *

At the annual meeting of the Ortonville Evangelical
Hospital the following were elected to the Board of
Directors: Rev. L. C. Milliken, Big Stone City; John
H. Iszler, Twin Brooks; Otto Krueger, Millbank. Of-
ficers elected are: President, Rev. Charles W. Zech,
Watertown; vice president, Rev. L. C. Milliken Big
Stone City; secretary-treasurer, Paul Trapp, Jr., Big
Stone City; Superintendent, Helen Flemming.

* * *

The first hospital in this country to be devoted
entirely to Sister Kenny's infantile paralysis treatment
will be opened in Minneapolis this month. It is the
Sheltering Arms hospital on West River Road near
Forty-second Street, which will be operated by St.
Barnabas hospital, oldest in Minneapolis. In recent
months, St. Barnabas hospital has been treating an
increasing number of polio patients with a staff trained
by Sister Kenny.

Priorities on essential materials to remodel the hos-
pital have been granted, and work is going forward
to revamp the building into a 40-bed hospital for
polio patients. Remodeling costs will run about \$30,000.
If necessary, the hospital can later be developed to
100 beds. Sumner T. McKnight is chairman of the
building committee.

Heading the staff of the Kenny institution will be
Miss Nellie Gorgas, formerly of the University of Chi-
cago clinic hospitals; Dr. Wallace A. Cole, professor
and director of the division of orthopedic surgery at
the University of Minnesota, and Dr. Miland E.
Knapp, director of the division of physical therapy at
the University of Minnesota.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

WAR MEDICINE. A symposium. Winfield Scott Pugh, M.D., Editor; Commander (M.C.), U.S.N. Retired; formerly Surgeon, City Hospital, New York City; Associate Editor, Edward Podolsky, M.D.; Technical Editor, Dagobert D. Runes, Ph.D. 565 pages. Illus. Price, \$7.50, cloth. New York: Philosophical Library, Inc., 15 E. 40th St., 1942.

PSYCHOTHERAPY IN MEDICAL PRACTICE. Maurice Levine, M.D. Attending Psychiatrist, Cincinnati General Hospital; Assistant Professor of Psychiatry, University of Cincinnati College of Medicine; Training Psychoanalyst, Chicago Institute for Psychoanalysis; Diplomate of American Board of Psychiatry and Neurology. 320 pages. Price, \$3.50, cloth. New York: The Macmillan Co., 1942.

SYNOPSIS OF PATHOLOGY. W. A. D. Anderson, M.A., M.D. Assistant Professor of Pathology, St. Louis University School of Medicine; Pathologist to St. Mary's Group of Hospitals. 661 pages. Illus. Price, \$6.00, flexible binding. St. Louis: C. V. Mosby Co., 1942.

EMERGENCY CARE. Marie A. Wooders, B.S., R.N., Principal, School of Nursing, Hackensack Hospital, Hackensack, N. J.; and Donald A. Curtis, M.D., Lt.

Col. Medical Reserve, Commanding 342nd Medical Regiment, United States Army; Instructor in Military Nursing, Hackensack Hospital. 560 pages. Illus. Price, \$3.50, cloth. Philadelphia: F. A. Davis Co., 1942.

CLINICS. Vol. 1, No. 1. (Semi-monthly. Successor to New International Clinics). George Morris Piersol, M.D., Editor. 264 pages. Illus. Price, \$12.00 per year, \$2.00 per issue; cloth bound, \$16.00 per year, \$3.00 per issue (by subscription), 50c additional for foreign and Canadian postage. Philadelphia: J. B. Lippincott Co., 1942.

FRACTURES, DISLOCATIONS AND SPRAINS. John Albert Key and H. Earle Conwell. 3rd Ed. 1303 pages. Illus. Price, \$12.50, cloth. St. Louis: C. V. Mosby Co., 1942.

Since the publication of the first edition of this book in 1934, it has become one of the standard guides for the treatment of traumatic injuries. The new third edition follows the comprehensive scope of the original work. The opening paragraph of the first chapter strikes one as being particularly pertinent and should be read by every doctor who is responsible directly or indirectly for the treatment of fractures in various hospitals. "One of the principal reasons for the poor results so frequently seen in the treatment of fractures and one of the reasons why so many men who see an occasional fracture dislike to treat it is that adequate fracture treatment cannot be carried out efficiently and successfully without apparatus, and at the present time

In all cases of suspected allergy, true caution suggests complete change to AR-EX Cosmetics regime. They are pure and free from all known irritants and allergens.

in the majority of general hospitals in this country there is a real lack of the necessary apparatus for the proper handling of fracture cases."

Some of the newer methods of treatment are brought out. In compound fractures the use of internal fixation is discussed. The local use of the sulfa drugs in fresh compound fractures and in the old infected fractures is mentioned. The use of these newer drugs to prevent wound infection in clean surgical wounds in bone and joint cases is stressed. The authors advocate the hanging cast method in the treatment of a large percentage of humeral shaft fractures. The various methods of hip nailing for fracture of the femoral neck are thoroughly discussed. The immediate immobilization of these fractures is advised, but the authors' method of using a hip spica seems unnecessarily cumbersome. It is pointed out that the inadequate methods used in treating finger fractures result in considerable disability in many cases of this common injury. The various aspects of back strain and industrial backs are gone into, emphasis being placed on the intensive treatment of acute injuries, with the object of preventing the chronic cases which are so resistant to treatment.

In many instances several methods of treatment are mentioned for one particular injury without the benefit of the authors' experience as a guide. Aside from this, the book is a comprehensive and safe reference for the general practitioner who necessarily treats the major share of these conditions. In time of war with a possible augmentation of injuries to the civilian population,

a work of this nature should be on every practitioner's shelf.

S. S. HOUKOM, M.D.

THE CARE OF THE AGED (Geriatrics). Malford W. Thewlis. Fourth Edition. 589 pages. Illus. Price \$7.00. St. Louis: C. V. Mosby Co., 1942.

The fact that this excellent book has passed from the third edition to the fourth edition in one year bespeaks the increasing interest in Geriatrics and the belief that this author has admirably catalogued the practical therapeutic connotations.

The new edition fortunately does not add materially to the size of the book, but certain items such as Chemotherapy in Surgery have been added apropos of the recent war experiences. The book contains a wealth of general information. It becomes a compact review of present-day therapy for disease. The chapters are well supported by references. The author and his associates have evidently surveyed all the available current literature dealing with the problems arising from age extension. The book does not aim (as does Cowdry's Compilations, for example) to cover extensively the biological, chemical, and psychological aspects of aging.

You will nevertheless make no mistake in adding the book to your library.

EDWARD L. TUOHY, M.D.

FOR NERVOUS DISORDERS

Operated In Connection

with

Homewood Hospital

Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.

CHILDREN ADMITTED

Will smallpox continue to decline in 1942?

SMALLPOX VACCINE

Lederle

THE new "low" in smallpox incidence reached in this country in 1941 compares most favorably with the perennially high incidence reported in previous years:¹

	Median
	1936-40
SMALLPOX.	9,574
1941	
1,368	

However, we are still far too tolerant of this dangerous disease.

To avert the possible increase in the incidence of infectious diseases, which history has shown is fostered during war time, our government recently made the commendable move of advising the immunization of all children over 6 months of age against smallpox. The success of this program, however, depends on the cooperation of every practitioner, public health official and local governing body alike.

TOOMEY,² in a recent analysis of active immunity in smallpox, stressed the integrity of the immunizing agent and the proper technique of vaccination. Lederle now has available "Smallpox Vaccine Lederle" which has been

further improved by the addition of Brilliant Green (reducing the bacterial count of the virus). The "take" with this product is quite satisfactory and its viability has not been diminished as compared with glycerinated vaccine cured without the dye.

¹Pub. Health Rep. 57:23,24 (Jan. 2) 1942.
²TOOMEY, J. A.: J. A. M. A. 119:18 (May 2) 1942.

PACKAGES
"Smallpox Vaccine Lederle" (U. S. P.)
1, 5 and 10 vaccinations
"Smallpox Vaccine Lederle" (Preserved with Brilliant Green)
1, 5 and 10 vaccinations

Supplied in glass capillary tubes, with sterile steel needle for each vaccination.

LEDERLE LABORATORIES, INC., 30 Rockefeller Plaza, New York, N. Y.

COMMANDO RAID!

Commando raids are dramatic and do their share in helping us win the war. Less spectacular, but equally important to Victory, is the role of nutrition in building a strong hard-hitting America.

COCOMALT, the enriched food drink, is doing its part in the all-out effort toward better states of nutrition. For, COCOMALT contains vitamins A, B₁, D and the minerals calcium, phosphorus and iron . . . all essential factors in well-balanced diets.

More and more physicians are recommending this delicious food drink for the entire family. The rich, full flavor of COCOMALT, either hot or cold in milk, is a delightful drink for those who will not ordinarily drink milk alone.

Cocomalt

ENRICHED FOOD DRINK

R. B. DAVIS COMPANY, Hoboken, N.J.

THE NEW APPROACH TO ADJUSTMENTS IN

Smoking Hygiene

- The new opportunity for patients' cooperation
- The value of keeping special case histories

THE relationship of nicotine intake to certain sub-clinical symptoms is of interest to the physician.

Time was when clinical observation in such cases was difficult. Patients were reluctant to fall in with limitations on smoking.

Now your recommendation of slow-burning Camels* is a simple step towards securing this cooperation. Millions have found an added "pleasure factor" in Camel's special mildness and unusually fine taste.

In anticipation of more accurate data when adjusting smoking hygiene, we suggest that you keep a separate file of these case histories. This may lead to interesting conclusions.

THE use of cow's milk, water and carbohydrate mixtures represents the one system of infant feeding that consistently, for three decades, has received universal pediatric recognition. No carbohydrate employed in this system of infant feeding enjoys so rich and enduring a background of authoritative clinical experience as Dextri-Maltose.

When depression accompanies more fundamental pathology

In many patients, depression may occur as an accompaniment of some more fundamental pathology, either organic or psychogenic. In such cases, the physician should bear in mind that, while Benzedrine Sulfate will not affect the underlying condition, its stimulatory effects may help to alleviate the concomitant depression which so often interferes with the management of the case.

Benzedrine Sulfate Tablets

Benzedrine Sulfate is primarily useful in depressions characterized by apathy and psychomotor retardation, but is contraindicated in patients manifesting anxiety, hyperexcitability, or restlessness.

The use of Benzedrine Sulfate by normals should not be permitted; it should always be administered under the careful supervision of a physician; and depressive psychopathic cases should be institutionalized.

In treating depressed patients with Benzedrine Sulfate, the physician should bear in mind that any drug which produces pleasant or euphoric effects may prove to be habit forming—especially in unstable or neurotic individuals.

SMITH, KLINE & FRENCH LABORATORIES, PHILADELPHIA, PA.

Liver Extract Squibb

- LOW IN TOTAL SOLIDS
- EXCEPTIONALLY CLEAR

IN PERNICIOUS ANEMIA, Liver Extract in adequate dosage will produce a prompt reticulocyte response and hematologic recovery. Once dosage requirements have been established and the blood picture returned to normal, administration may be reduced to two- or three-week intervals.

Concentrated Liver Extract Squibb (15 units injectable per cc.) offers the advantages of being low in total solids, and exceptionally clear and light colored. Its high concentration affords low dosage volume and may save the patient considerable discomfort. Furthermore, cost of maintenance is appreciably less than with effective doses of liver principle given orally. It is available in 3x1-cc. vial packages and in 5-cc. and 10-cc. vials.

Liver Extract Squibb is a sterile, aqueous solution, obtained from edible liver. Both the regular and concentrated potencies are standardized on the basis of the hematopoietic response in pernicious anemia as defined by the U.S.P. Anti-Anemia Preparations Advisory Board. This Board has ruled that at present a strength greater than 15 units per cubic centimeter will not be assigned to a preparation because of the possibility of loss, during the concentration process, of unknown factors of value in the treatment of patients with pernicious anemia.*

Solution Liver Extract Squibb (3.3 units injectable per cc.) is especially prepared. It is *not* made by diluting Concentrated Liver Extract. It is available in 10-cc. vials.

Our Job

By THOMAS L. LUZIER

We people of the United Nations have a considerable job on our hands. We must win the war. All that makes life worth living is at stake. We cannot all serve with the armed forces, but we can all do our bit. There is a job for everyone of us.

Much has been written about Civilian Morale and its importance to our war effort. What is Civilian Morale? In its best sense, is it not a feeling of confidence, shared by people with mutual beliefs and hopes and interests, that sustains a nation during any period of emergency or great stress? Is it not, in fact, an expression of national character?

At no time in our history has there been a greater need for confidence; confidence in our leaders, in our armed forces, in our physical and spiritual resources, in ourselves—confidence in all of these forces working together towards Victory, towards the preservation of those ideals and practices of liberty, justice, individualism and decency which are essential to our way of life, to our fundamental heritage.

Let those of us who for one reason or another cannot serve with the armed forces give as much of our time as possible to Civilian Defense, as much of our money as possible to the buying of War Bonds and Stamps, and every vestige of our national spirit, pride, determination and courage to the winning of the war. That is our job!

Highly Active **BACTERIOSTATIC AGENT**

Sulfathiazole exerts a prompt bacteriostatic effect upon a number of pathogenic organisms. A pronounced action is observed on the following:

**PNEUMOCOCCUS • STAPHYLOCOCCUS
GONOCOCCUS • MENINGOCOCCUS**

Remarkable clinical results have been consistently obtained in infectious conditions caused by these organisms. Complications which are commonly encountered in pneumonia, gonorrhea or meningitis are greatly reduced in frequency and severity.

The dosage should be adjusted to the nature of the disease, as well as to the age and condition of the patient. Write for dosage chart and booklet on Sulfathiazole-Winthrop.

Sulfathiazole-Winthrop is supplied in tablets of 0.5 Gm. (7.72 grains), bottles of 50, 100 and 500; also (primarily for children) in tablets of 0.25 Gm. (3.86 grains), bottles of 50, 100 and 500. Sterile powder is available in bottles of 5 Gm., ¼ lb. and 1 lb.

THE ART OF DOING THINGS WELL

THE WELL-BEING of hundreds of thousands of diabetic patients would be disturbed if the strength of lots of Iletin (Insulin, Lilly) should vary from the potency stated on the label. Uniformity is assured by vigilant testing—tests of crude materials, tests to control processing, tests for purity, sterility, and stability. Data for the standardization of one master lot of Iletin (Insulin, Lilly) may aggregate convulsion tests on several thousand mice and blood-sugar curves of one or two thousand rabbits. It is estimated that more than a million blood-sugar determinations have been made in the twenty years of Insulin testing—another example of the art of doing things well.

THE PRESENT STATUS OF THE HEMORRHAGIC DISEASES

ARMAND J. QUICK, Ph.D., M.D.

Milwaukee, Wisconsin

IT required a vitamin to stimulate a new interest in the hemorrhagic diseases. Due to vitamin K, a more optimistic outlook has been taken on the ultimate conquest of all the bleeding diseases. It seems timely, therefore, to outline the present status of our knowledge concerning the group of diseases in which hemorrhage plays a predominant role.

That there has been progress in this field of medicine is obvious to all who follow the current medical literature. The advance has been three-fold:

1. The concept of the physiology and pathology of hemorrhage and of hemostasis has been clarified and freed of futile and needlessly complex theories.
2. The diagnosis of bleeding conditions has been made more accurate by newer laboratory tests.
3. Therapy has been improved, and in the bleeding of jaundice and of the newborn has actually been revolutionized.

The hemorrhagic diseases can be divided into two major classes: (1) the true, in which the defense mechanism against hemorrhage is defective; and (2) the group of diseases in which hemorrhage is a prominent symptom, but the hemostatic process is normal. This second class can be dismissed without much comment since the basic defect is anatomical. In this category can be included traumatic injury of blood vessels such as occur in gastric ulcer, in tuberculosis, in malignancy, or in esophageal and anal varices.

From the Department of Pharmacology, Marquette University School of Medicine. Presented at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 29, 1942.

Likewise, hereditary telangiectasia and scurvy can be put into this group since in these conditions the defect in the vessel is anatomical—the physiological reactions of hemostasis are essentially normal.

To understand the true hemorrhagic diseases it is necessary to know what constitutes the mechanism of hemostasis. The latter process is best presented by following the course of events in a blood vessel that is injured or severed. The first reaction is a marked constriction, which often brings about a complete but temporary arrest of bleeding. This vascular response is of greatest importance, for it is during the contractive phase that the permanent plugging of the vessel is effected. It should be emphasized that it is the coagulation within the vessel that is responsible for effective hemostasis.

For purposes of presentation, the coagulation reaction can be expressed by two simple equations:

(1) Prothrombin calcium + thromboplastin = thrombin

(2) Fibrinogen + thrombin = fibrin (clot)

Actually the mechanism is much more complex and involves many poorly understood factors. Prothrombin occurs exclusively in the plasma and according to recent findings is a compound of calcium. The latter element is essential for its conversion to thrombin, since decalcifying agents such as oxalates and citrates render it inactive. Thromboplastin is exclusively an intracellular product. It is widely distributed within the body, but it is the fraction that comes from the platelets that plays the dominant role in coagulation.

The platelets have multiple functions in hemos-

tasis. Not only do they furnish thromboplastin, but they appear to serve as the cementing material that binds the fibrin to the injured vessel wall. A deposit of agglutinated platelets on the roughened or traumatized endothelial lining precedes the formation of fibrin, and serves to anchor the strands of fibrin. The platelets too are responsible for clot retraction which gives firmness and tenacity to the fibrin plug. But most important of all, the platelets are related to the contractive response of the vessels to injury.

The significance of the platelets in hemostasis is best illustrated by thrombocytopenic purpura. In this disease enough thromboplastin is usually available to maintain a normal coagulation time so that a fibrin clot can be produced, yet hemostasis is markedly defective. In the first place, due in all probability to the diminished number of platelets, the vascular contractive response is impaired, as shown by the prolonged bleeding time. The blood continues to flow freely from the dilated vessel and no opportunity is afforded for the formation of a clot within the lumen. In the second place, a lack of cementing substance needed to bind the fibrin strands to the injured vessel wall will result from the paucity of platelets, and likewise the retraction of the clot will not occur. As a result the clot will be friable, and poorly attached, so that its hemostatic value will be very poor. It is easy to understand, therefore, why hemorrhage in thrombocytopenic purpura is difficult to control.

In hemophilia the platelets likewise appear to be the causative factor of the disease. While they are normal in number, they appear to be unduly resistant to lysis and, therefore, liberate thromboplastin too slowly for effective coagulation.

In pseudohemophilia, a disease characterized by being definitely hereditary and by a prolonged bleeding time, the platelets also have been suspected of being responsible for the hemorrhagic tendency, but it is probable that the defect is intrinsically in the minute vessels themselves.

As stated before, the plasma furnishes two factors for coagulation: fibrinogen and prothrombin. The former can be dismissed from consideration, since it is exceedingly rare to find a bleeding diathesis due to lack of fibrinogen. Prothrombin deficiency, however, is of greatest importance.

It has been found that the body depends on vitamin K for its synthesis and that the site of its production appears to be the liver. It has further been observed that a coumarin derivative obtained from spoiled sweet clover hay causes a depletion of the prothrombin of the blood, and very recently an idiopathic hypoprothrombinemia, apparently congenital, has been reported. The latter type is especially worthy of notice since the condition simulates hemophilia, and can easily be mistaken for it.

The hypoprothrombinemias can be outlined as follows:

- A. Diminished prothrombin (prothrombinopenia)
 - (a) Lack of Vitamin K
 - 1. Dietary origin (lack of bacteria in intestines)
 - (i) Hemorrhagic disease of the newborn
 - 2. Failure of absorption
 - (i) Absence of bile salts in the intestines
 - Biliary obstruction
 - Biliary fistula
 - (ii) Intestinal disorders
 - Nontropical sprue
 - Ulcerative colitis
 - Prolonged diarrhea, etc.
 - (b) Poor utilization due to liver damage
 - 1. Chronic cirrhosis due to prolonged biliary obstruction
 - 2. Acute hepatitis (yellow atrophy)
 - 3. Chronic atrophic cirrhosis (Laennec)
 - 4. Hyperpyrexia (artificial fever)
 - (c) Toxins
 - 1. Spoiled sweet clover disease of cattle
 - (d) Essential or idiopathic (probably congenital)

With this clearer understanding of the nature of the more common hemorrhagic diseases, it is possible to outline the differential diagnosis on the basis of laboratory tests. It must be stressed, however, that clinical observations and the medical history are also necessary for arriving at an accurate diagnosis. Thus bleeding into deep structures, i.e., into muscles and joints, usually occurs when coagulation is defective. Hemophilia, and apparently idiopathic hypoprothrombinemia are the diseases in which for instance hemarthrosis is frequently encountered. Bleeding into the skin and oozing from mucous membranes is usually associated with diseases in which the vascular response is impaired. Thrombocytopenic purpura is the best example of this class. It might be mentioned that the petechiæ are the characteristic lesions in this disease. Ecchymoses are found, in contrast, in all hemorrhagic diseases.

In the history, the sex of the patient, the time of onset, the frequency of attacks, and the nature of the bleeding supply important information, but of greatest significance is the hereditary history. There are three bleeding diseases which are inheritable. These can be outlined as follows:

- I. Hemophilia
 - Sex-linked—recessive
 - Transmitted only by female
 - Occurs only in males
- II. Pseudohemophilia
 - Sex-linked—dominant
 - Transmitted by and occurs in both sexes
- III. Telangiectasia
 - Non-sex-linked—dominant
 - Transmitted by and occurs in both sexes

The laboratory tests are essential for diagnosis. Fortunately the common methods are simple and few in number. The following outline should serve as a helpful guide:

1. Prolonged coagulation time
 - (a) In hemophilia
 - (b) In the hypoprothrombinemias
 - (c) In marked reduction of plasma fibrinogen
2. Prolonged coagulation time of recalcified plasma.¹
 - (a) In hemophilia (characteristically influenced by the rate at which the blood is centrifuged)
 - (b) In the hypoprothrombinemias
 - (c) In thrombocytopenic purpura occasionally
3. Prolonged bleeding time
 - (a) In thrombocytopenic purpura
 - (b) In pseudohemophilia
4. Absence of clot retraction
 - (a) In thrombocytopenic purpura
 - (b) In pseudohemophilia occasionally
5. Reduced platelet count
 - (a) In thrombocytopenic purpura
6. Positive tourniquet test
 - (a) In thrombocytopenic purpura
 - (b) In pseudohemophilia occasionally
7. Reduced prothrombin concentration in the plasma
 - (a) See outline of prothrombin deficiencies

In using this outline, it must be remembered that exceptions can and do occur. Thus, for instance the bleeding time is sometimes prolonged in hemophilia. Nevertheless if these tests are carefully applied a reasonably accurate diagnosis can usually be made.

The fact that no specific cures for the hemorrhagic disease have been found except for the hypoprothrombinemias, does not signify that progress has not been made in this group of clinical entities.

For essential thrombocytopenic purpura sple-

nectomy still remains the most dependable therapeutic measure. The chief problem, however, is the differentiation of the idiopathic from the secondary purpuras. It is well to recognize that only a relatively small fraction of the hemorrhagic purpuras are primary. It is, therefore, of major importance to investigate the cause of the purpura. Infections, blood dyscrasias and allergy appear to be the most important factors in the secondary purpuras. It is well to bear in mind that thrombocytopenic purpura is frequently caused by drugs, of which the sulfanilamide group is no exception. Other types of allergy likewise appear to be responsible for producing hemorrhagic purpura. At our present stage of knowledge, removal of the cause is the most effective cure.

Specific therapeutic agents are still lacking. Vitamin C has been disappointing in all cases except in frank and sub-clinical scurvy. Vitamin P may perhaps be effective in certain types of purpura such as senile, but it seems to be useless in true Werlhof's disease. Epinephrine and related substances, such as stryphnon, have been used in European clinics and some success has been reported.

Many cures for hemophilia have been proposed, but so far none has stood the test of time. At present the injection of oxalic acid is attracting some attention. A little over two decades ago similar results were reported following the intravenous administration of sodium citrate. Why this treatment was abandoned is not clear. Perhaps further research is indicated.

While no clue for hemophilia is in the offing, much can be done for the hemophilic patient. Supervision of play and later guidance as to occupation to minimize the hazard of trauma goes a long way in the prevention of disabling deformities.

The treatment of hypoprothrombinemia with vitamin K has been discussed so much that only a few remarks seem necessary. In obstructive jaundice and in biliary fistula treatment with bile salts and menadione by mouth is usually sufficient. To be sure, the prothrombin content of the blood must be repeatedly determined and any operation should be postponed until the level is at least 70 per cent of normal. If the absorption of vitamin K is apt to be impaired by factors such as diarrhea, or if the patient is unable to retain food, menadione in oil should be given intra-

muscularly, or a water-soluble derivative given intravenously.

In liver disease the prothrombin may be low and vitamin K alone may be ineffective in raising the level. Treatment of the liver condition to restore hepatic function is the most logical course. Intravenous injection of glucose is still the most reliable means to treat hepatic dysfunction.

The treatment of the hemorrhagic disease of the newborn with vitamin K constitutes an important advance in pediatrics. The fact that the hypoprothrombinemia during the first few days of life can be prevented by giving vitamin K to the mother shortly before the birth of the baby is of utmost significance. Even though the incidence of hemorrhage in the newborn is low, the danger is present nevertheless, and therefore the routine practice of giving the mother 2 mg. of menadione in oil daily during the last week of pregnancy is certainly to be recommended. It is to be regretted that occasionally efforts are being made to belittle the value of vitamin K.

No effort will be made to discuss the treatment of the rarer hemorrhagic diseases. One should discuss at least briefly the most universally used therapy in the hemorrhagic diseases, namely blood transfusion. Apparently it is of value in nearly every type of bleeding diathesis. In addition to restoring blood volume and improving the anemia it assists in restoring the hemostatic response. Whether the new supply of platelets of the transfused blood is responsible for its effectiveness in purpura is not known definitely. In hemophilia the new blood perhaps affects the sta-

bility of the hemophilic platelets. In hypoprothrombinemia it restores at least partially the prothrombin level. Usually, however, the beneficial effect is only temporary.

Genetic considerations are important in the hereditary bleeding diseases. Hemophilia occurs principally in English and northern European stock. Due to the tendency toward small families in these races and the fact that hemophilia is inherited as a sex-linked, recessive characteristic, the disease has probably decreased although accurate figures to substantiate this statement are not available. Pseudohemophilia is a relatively rare disease, but the heritability of this disease is an unescapable fact. Telangiectasia is perhaps the most serious since it is transmitted as a non-sex-linked dominant. It does not seem to be generally recognized that this entity is a serious disabling disease.

The problem of handling a hereditary disease is difficult. Education, especially of the members of families in which a hemorrhagic disease occurs, is at least an essential preliminary step. They should be impressed with the seriousness of these diseases, and the responsibility that is theirs.

In conclusion, marked strides have been made in the hemorrhagic diseases, but much remains to be done. At present only part of the groundwork has been completed, but already the gully of misunderstanding which has separated the laboratory from the clinic has been closed.

MENIERE'S DISEASE

J. R. LINDSAY, M.D.

Professor of Otolaryngology, University of Chicago
Chicago, Illinois

THE terms Ménière's symptom, symptom complex and Ménière's disease have been used in a very broad sense until recent years. There has been a tendency to include under this general heading attacks of vertigo which could be attributed to various causes: for instance, toxic labyrinthitis, hemorrhage, thrombosis and other conditions. It has been known from clinical ob-

servations for many years that a definite syndrome existed consisting of recurring attacks of vertigo, associated with auditory disturbances also fluctuating in nature, which could only be explained by a disease involving the inner ear or the eighth nerve. Accumulating information in the last few years indicates that this syndrome is due to a pathological entity in the internal ear known as labyrinthine dropsy (hydrops labyrinthi, dilatation of the endolymphatic spaces). This

From the Division of Otolaryngology of The University of Chicago. Presented at the annual meeting of the Minnesota State Medical Association at Duluth, Minnesota, July 1, 1942.

constitutes the clinical entity which is now generally known by the name of Ménière's syndrome and because of the definite pathological lesion it seems that the name Ménière's disease is warranted.

disease have been described. Each case demonstrated the same inner ear pathology. In addition five ears with the same pathology have been described, two by myself, in which only deafness was known to have existed but in which there

Fig. 1. Photomicrograph of section of the cochlea in advanced labyrinthine dropsy in male of sixty-seven years. The cochlear duct (C.D.) is dilated almost to the point of obliteration of the scala vestibuli, and herniates through the helicotrema into the scala tympani (H). The neural elements are well preserved for the age period.

Fig. 2. Section through the vestibule in the opposite ear to Figure 1. The greatly dilated saccule lies against the stapes footplate. The utricle has herniated to some distance into the semicircular canals (arrows).

Pathology

The first observations of inner ear pathology were made by Hallpike and Cairns in 1938. Since that time a total of six proven cases of Ménière's

was a possibility that vertigo may have been present in earlier years.

The pathological picture consists of a generalized dilatation of the endolymphatic spaces in the

inner ear. Because of variations in thickness of the walls of the membranous labyrinth, the dilatation occurs in certain areas where resistance is less, namely, the cochlear duct and the saccule and utricle in the vestibule (Figs. 1 and 2).

the disease deafness may become severe and involves all frequencies.

The attacks of vertigo tend to decrease after a few years and may disappear but the deafness persists or may progress. This late stage in

Fig. 3. Composite audiogram of a case of Ménière's disease in the right ear showing the range of fluctuation in the hearing. The patient had some high tone loss in both ears, but the fluctuation with attacks affects mainly the lower frequencies. Bone conduction tended to vary directly with air conduction.

Fig. 4. Ménière's disease in right ear of 65-year-old male. The composite audiogram shows the variation in the hearing threshold in the affected ear (below) as compared to the good ear (above).

The fluctuation in the hearing for low tones is characteristic. The high tone loss is not a constant finding in this disease (See Figure 5).

The high tone limit as shown by the monochord remains nearly normal until the late stage of the disease (Figure 6).

This pathological entity provides a basis for the clinical syndrome of associated disturbances of hearing and equilibrium.

The histological picture does not explain the pathogenesis, however, nor is the etiology clear.

Symptoms

The classical syndrome in Ménière's disease consists of a sense of blockage or increasing noises, and increasing impairment of hearing in the affected ear, followed by an attack of vertigo. The vertigo may be sudden or may develop more slowly, giving time for the patient to protect himself against falling. Nausea and vomiting occur in the severe attacks. There is great variation in frequency, duration and severity of the vertigo. Other symptoms such as constipation, headache, fatigue and depression may precede an attack and perspiration and diarrhea accompany the vertigo. After the attack all symptoms may leave and the hearing improves. The fluctuations in hearing involve the lower tones. Variations of 30 and 40 decibels before and after an attack are common (Figs. 3 and 4). In later stages of

which only deafness is evident may occupy many years and if seen at such a time the true nature of the ear disease might be unsuspected.

Etiology

The cause of labyrinthine dropsy or hydrops of this type is not clear. Hydrops is known to occur in certain inflammatory diseases of the middle and inner ear and in certain diseases of the bony labyrinth capsule, but these conditions have been absent in Ménière's disease.

Since epithelial structures exist within the membranous labyrinth which apparently have the function of secreting and removing endolymph, some interference with their function might be expected, but histological examination has not demonstrated any definite lesion of these structures.

On the basis of clinical observation it is known that the syndrome appears in people with low blood pressure, vasomotor instability, headaches, and gastro-intestinal disturbances. It seems likely that the vasomotor disturbances may affect the capillaries in the stria vascularis or the aque-

uctus endolymphaticus in the inner ear, resulting in an increase in the amount of endolymph.

Diagnosis

In the presence of the complete syndrome of attacks of vertigo associated with fluctuations in hearing and other auditory symptoms the diagnosis of Ménière's disease is usually not difficult. Those conditions requiring differentiation are: tumors involving the eighth nerve or temporal bone, hemorrhage or thrombosis of vessels supplying the labyrinth, toxic labyrinthitis or eighth nerve neuritis, specific inflammatory disease such as syphilis, granuloma, injuries.

An acoustic tumor is easily distinguished by the steadily progressive or profound nerve deafness, frequent attacks of vertigo, absent vestibular responses, enlargement of the internal auditory meatus on x-ray examination and the involvement in later stages of other cranial nerves.

Tumor of the temporal bone other than eighth nerve tumors usually invade the air cell system and affect the middle ear. If vertigo occurs in attacks the fistula test is likely to be positive. All symptoms tend to be steadily progressive rather than fluctuating as in Ménière's disease, and the x-ray provides evidence of bone erosion.

Syphilis, particularly of the congenital type, frequently produces an osteitis and progressive labyrinthitis. Vertigo may occur in attacks and the fistula test become positive. Deafness progresses rapidly without fluctuations, other stigma of the disease may be present and the serology of the blood or spinal is usually positive.

Hemorrhage or thrombosis affecting the vessels supplying the labyrinth results in a severe attack of vertigo, nausea and vomiting with profound nerve deafness. The deafness is permanent and recovery from the vertigo requires a period of weeks during which compensation gradually develops. There is usually permanent loss of vestibular responses in the affected ear. A similar course of events is characteristic of hemorrhage into the labyrinth in severe skull trauma, also of a basal skull fracture involving the labyrinth.

Greater difficulty may be experienced in differentiating some cases of toxic involvement.

A neuritis of the acoustic division of the eighth nerve is common after mumps and occasionally after some other infections. The vestibular division usually escapes but may be affected also. Complete permanent deafness of one ear is fairly

common and occasionally vertigo and loss of vestibular function. Certain drugs such as quinine, salicylates, and less frequently alcohol and tobacco have a tendency to affect the eighth nerve and produce vertigo and auditory symptoms.

A few cases have been reported in which attacks of vertigo and impaired hearing occurred in connection with allergic attacks. Some evidence of allergy is not uncommon in people with Ménière's disease, but the impression that the disease is to be considered as an expression of allergy is unwarranted.

Attacks of vertigo without any auditory disturbances may present a more difficult problem of diagnosis.

In order to localize the lesion definitely to the peripheral vestibular apparatus it is necessary to have associated auditory disturbances. On the other hand certain characteristics of the vertigo; nystagmus which occurs only on directing the gaze away from the resting position and always in the direction of gaze; a postural vertigo in which the nystagmus changes its direction or is irregular in direction; a marked discrepancy between the amount of vertigo and the degree of nystagmus, also oblique or vertical nystagmus is usually central in origin.

The conditions to be differentiated as causes for vertigo without auditory disturbances include early brain tumors, degenerative diseases of the central nervous system, such as multiple sclerosis and syringomyelia, encephalitis, hemorrhage and thrombosis, post-concussion syndrome, arteriosclerosis, hypertension and hypotension. While the characteristics of the nystagmus may be sufficient to place the lesion centrally the diagnosis in most of these conditions depends upon the presence of associated central nervous system signs and other indications of the particular disease.

While a central nervous system lesion which would produce only vertigo must be very limited in extent it appears that in addition to specific vascular lesions such as the posterior inferior cerebellar artery syndrome, small vascular lesions may occur in the central nervous system in arteriosclerotics, producing vertigo as a chief symptom. These usually have a sudden onset and slow gradual recovery.

Hypertension is associated with frequent vertigo, usually of short duration. Defective circula-

tion is likely to be associated with vertigo on changing from the lying or sitting to the erect posture.

Recurring attacks of vertigo, frequently postural in character, without auditory disturbances

the third stage after vertigo attacks had subsided, leaving advanced deafness (Fig. 6).

Treatment

Good results have been obtained by both medical and surgical therapy. The most successful

Fig. 5. Composite audiogram in Ménière's disease in the left ear. Threshold for high tones and upper limits well preserved. Bone conduction fluctuates directly with air conduction.

Vertigo attacks, often postural, occurred for one year before hearing was affected.

Vertigo relieved by Portmann's operation but fluctuations in hearing threshold still persist eighteen months after operation.

Fig. 6. Advanced deafness in Ménière's disease of eight years' duration. Attacks of vertigo absent for the past two years. Moderate fluctuations in hearing threshold and in tinnitus still occur.

frequently occur in the so-called "hypotonic" individual in whom the blood pressure tends to be low and to fluctuate widely. The basal metabolic rate may also be low and headaches, gastrointestinal disturbances and signs of vasomotor instability occur. This occurs frequently as early as the third decade. The attacks may occur only during a certain posture, such as lying on one or the other side, and may be present for a few days, then disappear.

In this particular group it is sometimes possible to localize the lesion with some certainty to the central nervous system because of the characteristics of the nystagmus, and in these the most likely explanation appears to be on a vasomotor basis.

The symptoms may disappear entirely or they may recur at intervals. A few cases of this type have been observed in which after as long as one year of vertigo attacks auditory disturbances appeared and the diagnosis of Ménière's disease became evident (Fig. 5).

It has been possible in some cases of Ménière's disease to recognize three stages: The first stage when only vertigo was present, the second stage when the complete syndrome was present, and

medical treatment has been on the basis of attempting to control the fluid balance. The discovery of hydrops of the labyrinth has provided a rational basis for this type of therapy. It has been possible to obtain good results in most cases by a combination of limitation of the salt intake, careful control and distribution of the intake of food and fluids, the administration of ammonium chloride as recommended by Furstenberg, or of potassium chloride (3 to 4 teaspoonfuls of a 25 per cent solution per day), along with adequate rest and mild sedation, if necessary.

Histamine therapy has apparently given temporary relief in some but has not met with general lasting success.

Inflation of Eustachian tubes has been quite unsuccessful in the true Ménière's cases in the author's experience.

Surgical treatment is justifiable in cases resisting medical therapy. Two types of surgical procedure have been used: some form of an operation on the labyrinth and an operation to cut the vestibular part of the eighth nerve.

Injection of the labyrinth with alcohol destroys function entirely and is, therefore, undesirable in patients with useful hearing.

Portmann's operation on the saccus endolymphaticus preserves the hearing but has not always given permanent relief to the vertigo.

More recently operation on one or more semicircular canals has been used with the desired result of stopping vertigo while preserving the hearing.

Section of vestibular division of the eighth nerve is also a sound and successful procedure in severe cases. It has the disadvantage of being a more formidable procedure with greater surgical risk. The recovery period is somewhat longer than with operation on the labyrinth.

Summary

The information obtained in recent years seems to have established the entity of labyrinthine dropsy (dilatation of the endolymphatic spaces) as the anatomico-pathological basis for the well known syndrome of attacks of vertigo associated with fluctuating auditory disturbances. While considerable confusion has existed as to the proper use of the terms Ménière's syndrome or disease, it now seems clear that if the term Ménière's disease is to be retained it should be applied only to the disease of the inner ear herein discussed.

THE CONTROLLED ADMINISTRATION OF FLUID TO SURGICAL PATIENTS

Including Description of Gravimetric Methods of Determining Status of Hydration and Blood Loss During Operation

OWEN H. WANGENSTEEN, M.D.
Minneapolis, Minnesota

IT MIGHT appear that any instruction in the matter of administration of fluid to surgical patients is wholly superfluous. Until the studies of Collier and his associates from the University of Michigan focused the attention of the surgical profession upon common flagrant abuses in the administration of fluid and electrolytes to patients, it was a general feeling amongst surgeons that no particular problem hinged about this item. Pediatricists, who deal with infants, have been alive to the importance of the problem for some time. The studies of Gamble, McQuarrie and Hartman and their associates upon fluid and mineral requirements are well known. The work of Collier and his associates aroused surgeons from their apathy with reference to the importance of fluid administration and most of us are now alert to its significance during convalescence after operation.

There are essentially four problems which bear upon the issue of the fluid requirements of patients undergoing operation: (1) water requirement; (2) electrolyte needs; (3) blood loss factor; and (4) caloric and nitrogen requirements of the patient.

From the Department of Surgery, University of Minnesota Hospitals, Minneapolis, Minnesota.

Water Requirements

In the administration of water to a patient after operation, the surgeon may fall into errors of giving either too much or too little. Both mistakes may be followed by grave consequences. Patients with severe dehydration may exhibit shock and may die because of lack of enough available water to supply tissue cells with the requisite amount of fluid. The administration of too much fluid is particularly hazardous in the older age group patient with impaired cardiac reserve. Increases in blood volume, owing to too rapid as well as the administration of too much fluid, may provoke cardiac failure and pulmonary edema. Surgeons, unwittingly, when they were striving to lengthen life have undoubtedly shortened many lives in being delinquent on this score. Most of our postoperative therapeutic directives have been set up with the young person in mind, whose latitude of tolerance for abuse is great. The patient of three score years and more with poor cardiac reserve has a very narrow margin of toleration. The surgeon must learn not to trespass beyond those narrow marginal limits.

When the patient hydrates himself by drinking water, satisfaction of the sense of thirst is, in the main, a fair criterion of the status of hydration. When, however, with an inlying duodenal tube in place, hydration is accomplished by

parenteral methods, the most readily available guide to the status of hydration is the urine output and the specific gravity of the urine. In the Surgical Clinic at the University Hospitals,

for hemoglobin, hematocrit and plasma proteins will solve the issue in such an instance—especially if pre-operative values are available as a basis for comparison. In our clinic, we have

Fig. 1. Use of the weighing scale in determining the status of hydration of postoperative patients. The patient is weighed daily before operation, immediately after operation and again each morning before the intravenous administration of fluids is begun. (This practice should appear attractive to the cardiologist in following the status of hydration in decompensated patients—the block on the scale should support a chair, instead of a litter for such orthopedic patients.) This scale will weigh to an accuracy of 100 grams. (Surg., Gynec. and Obstet.,¹⁴ 72:257, Feb. 15 (2A), 1941, and Intestinal Obstructions,¹⁵ 1942, p. 243.)

a daily urinary output of 800 to 1,000 c.c. with a specific gravity within the normal range of 1.012 to 1.020 is looked upon as providing ample assurance that the fluid requirements of the patient have been met. The more trying problem concerns the patient who, it is believed, has received enough fluid to maintain a satisfactory fluid balance, but who exhibits an oliguria, excreting only a small amount of urine each day, during the first few days after operation. Almost all surgeons are familiar with this occurrence; moreover, all surgeons are very apprehensive over the item of oliguria and anuria. When a patient excretes, after operation, 350, 200 and finally less than 100 c.c. of urine on successive days, despite an adequate intake of fluid, the surgeon has adequate grounds for real anxiety. Most surgeons solve this problem by continuing to give more and more fluid, believing that the patient is dehydrated and reasoning that the lost fluid is being shed through the skin. There are those who insist that, determination of the values

solved this problem by weighing routinely all patients following major operations^{14,15} (Fig. 1). If the preoperative weight has been exceeded and enough fluid has been given so that a satisfactory urine output reasonably could be expected and oliguria continues, there is no need to give more fluid. The continued administration of fluid to such a patient will cause cardiac failure, pulmonary edema and death. Prior to instituting weighing patients as a means of following intelligently the status of hydration, I confess to having brought about cardiac failure and fatal drowning of several old, poor risk patients with low cardiac reserve, when the patients were oliguric during the early postoperative period. I have the impression that other surgeons have fallen into the same error, especially those who have lent an attentive ear to meaningless claptrap catch phrases as "push fluids" and other equally euphonious but empty expressions. Weight increases of 4 to 5 per cent over the patient's pre-operative weight speak significantly for over-

hydration of the patient. I have the definite feeling, despite the obviously gross character of this differential criterion, that the weighing scale is the most *precise* manner of ascertaining the status of hydration in postoperative patients—more accurate than determinations of hemoglobin, hematocrit and plasma proteins. As a matter of fact, I have seen such oliguric patients after operation in which ascertainment of the status of hydration by the criteria just enumerated suggested that the patient in question was dehydrated and needed more fluid. Proponents of physical measures for determination of whether hemodilution or hemoconcentration is present in a given oliguric postoperative patient would disregard the weights of the patient if that data did not tally with theirs. I have learned to have far more reliance on the trustworthiness of the pre- and postoperative weights as the best guide to the status of hydration. When a patient continues oliguric for several days and his weight has exceeded the pre-operative weight by 3 to 4 per cent, the administration of more fluid will usually provoke pulmonary edema. Next to regurgitation from the stomach into the lungs, the most common cause of postoperative pneumonia is probably administration of too much fluid.

Dehydration may accompany prolonged vomiting, the use of the indwelling duodenal tube without adequate replacement of fluid aspirated, diarrhea and abnormal sweating, and profound diuresis provoked by the too rapid administration of hypertonic glucose solution. Dehydration is a condition more amenable to correction, in the main, than is overhydration carried to the point of inviting pulmonary edema in patients with a poor margin of cardiac reserve. Coller and Maddock⁴ state that, in patients presenting *manifest* evidences of dehydration, 6 per cent of the body weight has been lost and that amount of fluid should be given.

Electrolytes

What kind of fluid should be given? I believe it is fair to suggest that surgeons have been somewhat indifferent on this score. It has not been uncommon practice amongst some surgeons to give all paraoral fluids in physiological saline solution. The error of such practice is not difficult to detect. Normal saline solution, unlike water and hypertonic solutions, does not afford the kidney a vigorous impetus for the ex-

cretion of urine; in consequence, water and salt are eliminated slowly and retention of sodium chloride and water occurs. For every gram of sodium chloride retained and not excreted, 100 c.c. of water is retained. The daily administration of 2 to 3 liters of saline solution is, therefore, bound to terminate in salt retention and edema. Obviously, not more salt should be given than is requisite to meet the body needs.

Whereas surgeons must rely on a number of guides to determine the amount of water a patient needs (thirst, urine excretion, determination of status of hemoconcentration and gross body weight), there are direct means of knowing whether a patient has had enough salt. Sodium chloride is a threshold substance and when given in more than adequate quantities, it is eliminated in the urine;⁹ daily excretion of 2 to 3 grams of sodium chloride in the urine suggests that enough salt has been given. The most accurate index of sodium chloride balance is determination of the plasma chloride level. Normal values for sodium chloride in the plasma lie between 560 and 600 milligrams per cent. Coller and his associates have suggested, in conditions attended by hypochloremia, such as pyloric obstruction associated with vomiting, that, for each 100 mg. per cent the plasma chloride needs to be raised to reach the normal value of 560 mg. per cent, the patient be given 0.5 gram of sodium chloride per kilo of body weight. In a patient weighing 70 kilos and in whom the plasma chloride value is found to be 460 mg. per cent, the patient will need $560 - 460 = 1 \times .5 \times 70 = 35$ grams sodium chloride. These predicted calculated values coincide quite accurately with clinical trials. It is not to be forgotten, however, that man has no apparent appreciation of a bodily need for sodium chloride. Whenever imbalance of the sodium electrolyte equilibrium may be present, it is up to the surgeon to detect this deficiency.

For the ordinary postoperative patient, 5 to 9 grams of salt daily suffices. Salt lost through the agency of aspiration through an indwelling duodenal tube averages about 5 grams per liter; salt lost by perspiration about 3 grams per liter; the salt loss in insensible perspiration is negligible. Anesthetized patients notably lose considerable fluid by perspiration because of the vasodilating effect of anesthesia on the skin capillaries. In spinal anesthesia, this effect is noted only below the level of anesthesia.

Necessary fluid, beyond the requirements of sodium chloride given in physiologic saline solution, should be given as glucose solutions. In the main, there is little need to employ repair solutions other than saline solution in the management of disturbances of the electrolyte pattern of the plasma and interstitial fluid compartment. In contractions of fluid in the extracellular compartment (plasma and interstitial fluid, it is the sodium (cation) and chloride (anion) relationship which may be disturbed seriously. Neither the sodium nor the chloride ion have an available source for replenishment from within the organism; consequently they must be supplied. No matter which ion has been lost preponderantly—whether the chloride ion (alkalosis) or the sodium ion (acidosis), on the administration of saline solution the normal sensitive kidney will regulate the retention and excretion of electrolytes in such a manner that a normal extracellular fluid volume will be restored with correction of temporary defects in the composition of the electrolyte pattern. In severe dehydration, renal injury is not uncommonly present. In this circumstance, the liberal administration of a dilute glucose solution will assist in adjusting the diminished plasma volume, providing at the same time surplus water to aid the kidney in eliminating the ion is present in excess.

On the surgical service, we have followed these suggestions of Gamble, employing solutions of salt and glucose to repair contractions in extracellular fluid and electrolyte disturbances, with complete satisfaction. We have had next to no experience with the use of the more elaborate Ringer-Tyrode or Hartman repair solutions. Only in acidosis, a third agent, sodium bicarbonate solution (5 per cent) has been used to help restore contraction of the plasma bicarbonate.

The oral intake of a patient with an inlying duodenal tube is aspirated almost in entirety. All patients having gastric suction must be hydrated by para-oral means, either by the subcutaneous or the intravenous route. In the main, proctoclysis is a little too uncertain to be relied upon. In giving intravenous infusions, unless to patients exhibiting the contracted blood volume of dehydration or shock—all such infusions should be given slowly, lest the work of the heart be increased appreciably.

Blood Loss Factor

A brisk bleeder, loose in a deep wound for a minute, can pyramid blood loss astonishingly. During those few anxious moments, more blood may be shed than through the whole ordeal of a lengthy and trying operation, in which the surgeon's aim is to do the job well and with minimal spillage of blood. The surgeon who has a penchant for operating in a bloody field and who cuts vessels before they are secured by hemostats instead of after, finds that his patient cannot tolerate long operations. Unwittingly, therefore, he perpetuates the tradition of pre-anesthetic days that operations must be done with despatch. When surgeons quit repeating such fictional myths and discover the cause of their own deception, surgery will have taken a definite step forward.

For a period of many months, it has been routine practice with the writer to employ dry sponges during operation. This permits the surgeon to determine the blood loss to an accuracy of a few grams. The complete increment of gain in weight is calculated as blood loss, even though some of the gain in weight of sponges used in peritoneal or thoracic operations, is owing to absorption of fluid with a protein content of 2 to 4 grams per cent. It might appear that the use of dry sponges imposes a serious handicap on the surgeon. Experience suggests definitely that it does not. However, large packs which are employed to cover the intestine are kept moist to keep fibrin formation on the bowel at a minimum. Such sponges are counted but not weighed. The usual blood loss in a gastric resection runs between 300 and 500 c.c. A single brisk bleeder augments the blood loss decidedly.

The precision of gravimetric methods, such as weighing sponges, as well as the patient himself, affords the surgeon helpful orientation concerning what he must do to accord his patient maximal protection. At any time during the operation, the surgeon can inform himself of what the blood loss has been up to that juncture. Because of the lack of reaction attending the administration of plasma, the writer prefers it to blood. In each operation of any magnitude, plasma is allowed to run into one of the patient's leg veins in such a manner that when the operation is over, the patient has received 100 to 200 c.c. more plasma than the total increment of gain in weight of the sponges. There are hazards of

over-replenishing blood loss as well as in failure to replace it adequately. Aged, poor risk patients with impaired cardiac reserve should not be asked to withstand increases of blood volume as well

starvation are well withstood. Whereas maintenance of caloric balance is important for the postoperative patient, it is of even greater importance to the patient who awaits operation, es-

Fig. 2. Use of the weighing scale in determining blood loss during operation. At any juncture, the surgeon may know how much blood has been lost. The surgeon must, of course, employ dry sponges. This scale will weigh to an accuracy of 1 gram.

as operation. At the same time, the actual blood loss must be made up so that the patient does not have to tolerate both operation and blood loss. The planned procedure with a watchful eye to every detail is the best assurance against the perils of operation.

Large blood losses are to be replaced preferably by blood. When multiple transfusions become necessary, it is a good plan to follow the suggestions of DeGowin, providing an alkaline urine by the intravenous administration of sodium bicarbonate solution (250 c.c. of 5 per cent solution). It is DeGowin's contention that albuminous casts are less likely to form in the renal tubules, attending hemolytic reactions, if the urine is alkaline.

Maintenance of Caloric and Nitrogen Equilibrium

Surgeons have been very remiss in meeting the caloric and nitrogen requirements of patients during recovery from operation. Enough glucose is given ordinarily to offset the ketosis of starvation—but not enough to meet the energy requirements of the patient. Surgeons have been abetted in this dereliction by physiologists who have emphasized repeatedly that temporary periods of

pecially the patient who has lost weight because of inability to take food. The patient with long continued complete pyloric obstruction exhibits the extremity of difficulty confronting the surgeon in preparing such a patient for operation by intravenous therapy. During the ketosis of starvation, the glycogen and protein deposits in the liver are exhausted and fatty infiltration occurs. Patients with fatty livers are notably poor risks for operation. Ravdin and his associates have demonstrated that a combination of a high protein and carbohydrate diet given by mouth is particularly efficacious in removing fat from the liver and replenishing the normal glycogen and protein deposit stores. Whereas similar studies on intravenous feedings are not available, experience gained in this clinic by operating on patients with long standing pyloric obstruction, prepared for operation by trying to meet caloric and nitrogen requirements, suggests that patients can be prepared by intravenous therapy alone, if need be, to withstand formidable operations lasting four to six hours.

Elman and Brunschwig and their associates appear to have demonstrated that nitrogen equilibrium may be maintained by the intravenous administration of commercially available amino

acids alone (amigen) combined with the use of liberal quantities of carbohydrate as a protein sparer. From Brunschwig's tables it is easily apparent, however, that a positive nitrogen balance (nitrogen retention) was more easily sustained if protein was given by mouth. Our own attempts to date at achieving nitrogen balance with intravenous injection of amino acids (preparation of F. Stearns or Mead Johnson) as the sole source of nitrogen intake have not been in accord with those findings, *viz.*, we failed to observe nitrogen retention and found a high excretion of nitrogen in the urine and note that our patients were in negative nitrogen balance despite liberal use of carbohydrate as a protein sparer. We had observed previously,¹³ however, that nitrogen balance may be achieved by the intravenous injection of plasma protein. Five hundred to 600 c.c. of plasma a day (40 grams protein) suffice to establish nitrogen equilibrium though we failed with 75 grams of amino acid protein. It is probably debatable, however, whether it would be wise to give 40 grams of plasma protein intravenously day after day, lest the infusion of this iso-osmotic colloidal solution increase the blood volume and the venous pressure and invite heart failure.

Our practice has been to give 1,500 c.c. of a 20 per cent glucose solution intravenously over a ten- to fifteen-hour period. With this slow rate of injection, daily quantitative studies of the urine show practically complete utilization of the sugar injected. The disadvantage hedges about thrombosis of the veins with such concentrated glucose solutions. Yet, recognizing the need of meeting at least the basal caloric requirements of the patient, and not wishing to give too much fluid to poor risk patients, we have continued to follow this practice and have observed no untoward effects from its use other than occasional thrombosis of the veins. About 75 grams of amino acid protein is injected intravenously daily and 100 to 200 c.c. of plasma. An approximation of caloric and nitrogen balance can be achieved by these means.

To be sure, as Raydin and his associates have emphasized, if the patient can take food by mouth, the preparation of a patient for operation by oral feedings is considerably more effective than by intravenous feedings. In poor risk patients who have lost considerable weight, not exhibiting complete pyloric obstruction, we employ

the constant intragastric drip (day and night), giving about 90 to 100 c.c. an hour of a high protein and carbohydrate and low fat mixture of food (Varco gastric diet No. 2).

This method of preparation of the patient excels intravenous feedings in simplicity and effectiveness considerably. Yet, there are patients in whom the method is not applicable. Furthermore, we have had now the experience of preparing several patients with complete pyloric obstruction exhibiting large weight losses for extensive gastric resections by the intravenous therapy alone. The mortality of resection for ulcer in this clinic (exclusive of the acute perforation and the bleeding ulcer) has been approximately 1 to 3 per cent during the past few years. The mortality of resection for malignancy during the same interval has hovered about 8, 10 and 12 per cent. It was reasoned that this difference in risk was explained satisfactorily by the age disparities of the ulcer and carcinoma groups. During the past year, however, with increased emphasis on trying to prepare the poor risk carcinoma patient adequately for operation by feeding, we have erased largely the difference in mortality between the two groups. In thirty-nine consecutive resections for malignancy of the stomach during the past twelve months,* only one patient died in hospital—a total gastrectomy in which unfortunately a small gauze sponge was left in the peritoneal cavity, the patient dying of intra-peritoneal abscesses more than eight weeks subsequently. In this group of patients with gastric carcinoma were several whom in former years we would have lost because of failure to meet adequately caloric and nitrogen requirements.

Summary and Conclusions

By proper attention to the controlled administration of fluid to surgical patients, the indications for many operations may be extended to the poor risk patient without increasing the risk materially. The items with which the surgeon must concern himself relate to the following: (1) water requirements of the patient; (2) electrolyte needs; (3) the blood-loss factor in operation, and (4) the caloric and nitrogen requirements of the patient.

It is suggested that the surgeon interest himself more in precise means of determining

*September 1, 1941, to September 1, 1942—Total hospital mortality 2.56%.

whether these needs of the patient have been satisfied. The experience of this clinic suggests that weighing the patient is the most precise method of determining the status of hydration of the postoperative patient. Similarly, employment of dry sponges during operation permits the surgeon to employ the weighing scale to gauge accurately the extent of the blood loss.

CLINICAL ASPECTS OF BRANCHIAL FISTULÆ

With a Case Report of Bilateral Complete Branchial Fistulæ

ERNEST R. ANDERSON, M.D., F.A.C.S.

Minneapolis, Minnesota

BRANCHIAL fistulæ, sometimes called lateral cervical fistulæ, lateral vestigial ectodermal or entodermal fistulæ, branchiogenic fistulæ or persistent branchial clefts have been known as a surgical entity for over one hundred and fifty years. These are congenital fistulæ and present a considerable variety of clinical findings. Even though there has been a great deal of investigation and observation reported in the literature, there is very little agreement as to the exact origin of these fistulæ.

The first reports of congenital cervical fistulæ were made by Hunczowski¹⁹ in 1789 and by Dzondi¹⁹ in 1829. The existence of branchial clefts in mammalian and human embryos were first accurately described by von Rathge¹¹ in 1825.

In 1832 Von Aschersön⁷ published his "De Fistulis Colli Congenita" in which he reported eleven cases of congenital neck fistula. He definitely recognized the inner orifice as pharyngeal and not tracheal and distinguished between medial and lateral fistulæ. It was the first time that the lateral cervical fistulæ were associated with the incomplete closure of the branchial clefts.

Von Heusinger¹¹ in 1864 believed that the in-

ternal orifice of all fistulæ was situated on the lateral wall of the pharynx at the base of the tongue. He was of the opinion that the location of the external fistulous opening determined the cleft at fault and that the fourth cleft was responsible when the orifice was at the sterno-clavicular junction.

In 1887 Rabl¹⁶ described the formation of the branchial clefts and the cervical sinus showing how they were obliterated by the apposition of ectoderm with ectoderm which resulted in the disintegration of cells. He demonstrated that the second cleft was much more apt to persist embryonically because of its greater depth and came to the conclusion that the second cleft and its attachments are almost invariably at fault in the formation of branchial anomalies.

Von Kostanecki and von Mielecki¹¹ when studying this subject in 1890 found the most frequent and constant internal opening of fistulæ to be located in the supratonsillar fossa and concluded this corresponded with the second cleft. They believed that the complete fistula originated from a rupture in the cervical sinus of the second pharyngeal pouch.

Wenglowski,²⁰ a Russian embryologist, in 1912, after a five-year study on seventy-eight human embryos and 246 cadavers, concluded that the

Inaugural Thesis presented before the Minneapolis Surgical Society, Minneapolis, Minnesota, May 7, 1942.

lateral cervical fistula originated from the thymopharyngeal duct which develops from the third pharyngeal pouch. He believed that the branchial apparatus could not leave remnants in the neck below the hyoid bone.

Frazer⁹ in 1924 presented the possibility that branchial rests and fistulæ developed from the "ectodermal external pharyngeal ducts" or the "entodermal internal pharyngeal ducts" which are embryologic structures of the branchial apparatus. He postulated that the placodal bodies or epithelial bodies in the branchial or visceral grooves might be the source of vestigial cervical anomalies.

The branchial apparatus begins to develop in the human embryo in the third week. By the end of the second month the structure has disappeared. On each side of the neck region there appear five bars or branchial arches separated by depressions or branchial grooves. These are covered with ectoderm. In the foregut there develop corresponding bars or pharyngeal arches and depressions or pharyngeal pouches, which are covered with entoderm. Mesoderm separates the ectoderm and entoderm in the branchial apparatus except where the branchial pouch and pharyngeal pouch approximate each other and there the ectoderm and entoderm are together forming the separating membrane. Each arch contains a cartilaginous core, a primitive aortic arch and a nerve. These persistent structures serve to identify the site of origin or any given fistula when their relationship is determined.

The first and second arches grow more rapidly than the others and overlap them. A recess is formed called the cervical sinus or the pre-cervical sinus¹⁰ of His. At first the sinus opens wide laterally, but as the second arch grows downward the sinus opening narrows to a small duct and then becomes obliterated. The second, third and fourth branchial grooves communicate with the cervical sinus.

The theories of the origin of branchial fistula fall into two groups, namely, the branchiogenic theory and the thymopharyngeal duct theory. They are as follows:

A. Branchiogenic theory:

1. The rupture of the separating membrane producing a persistent branchial cleft.
2. An anomalous development of malformed branchial arches and grooves.
3. The incomplete retrogression of the branchial apparatus.
4. The persistence of the cervical sinus.

5. Remnants of the ectodermal external pharyngeal ducts or of the entodermal internal pharyngeal duct.
 6. Branchial rests from the placodal bodies or epithelial bodies in the branchial or visceral grooves.
- B. Thymopharyngeal duct theory—(Wengłowski²⁰).

Normally all the branchial grooves are obliterated except the first which, together with the separating membrane and the first pharyngeal pouch, develop into the external auditory canal, tympanic membrane, and Eustachian tube, thus nearly forming a normal fistula. The second pharyngeal pouch contains the anlage of the palatine tonsil. The internal opening of a cervical fistula which has developed from the second branchial groove should be in the tonsillar fossa. This is the site of the internal opening of the complete fistulæ in nearly all the reported clinical cases. The internal opening of the third pharyngeal pouch would be in the pyriform fossa and the internal opening of the fourth would be in the lower end of the pharynx. Internal openings of cervical fistulæ in these locations are very uncommon and there is some doubt if they ever occur.

A fistula bears definite and distinct relationship to the main vascular and nervous structures of the neck if their development is normal. These relations are facts and not theories and are absolutely fixed. A fistula having its origin from the second branchial groove passes between the external and internal carotid arteries and in front of the vagus nerve. The course of a fistula from the third groove goes behind the common or internal carotid arteries and in front of the vagus nerve. A fistula originating from the fourth branchial groove would have to go around the arch of the aorta on the left side, and around the subclavian artery on the right side. Frazer⁹ states that the only ones that have been recognized with certainty are those from the second.

This discussion of the clinical features of branchial fistulæ is based upon the review of 107 case reports appearing in the surgical literature, and the following case of bilateral complete fistulæ.

Case Report

A white male, sixteen years of age presented himself at the surgical dispensary of Wells Memorial House complaining of discharge from two openings on the front of the neck. The two small openings had been present since babyhood. The mother stated that drops

of milk would appear on the neck from each opening when he nursed. There had been no other particles of food that had come from the openings. There never had been any soreness about the openings or in the neck. The mother and the boy had never noticed any swelling in the neck.

The discharge was usually a clear thin fluid which kept the skin of the neck moist. At times the fluid was yellow and sometimes had a foul odor. Eating did not produce any change in the amount of fluid which drained.

He had measles when one year of age, chicken pox when three and German measles when seven years old. At the age of ten years he had a tonsillectomy. Since then he has had no sore throats. Previously he had not had any swelling or masses in the neck.

The mother, the father, and an only brother twelve years old, had no abnormalities in the neck. The mother stated that she did not know of any relative on either side of the family that had any neck abnormality.

Examination revealed a well developed, well nourished boy, 138 pounds in weight and five feet seven inches in height.

On the anterior surface of the neck there were two pin-point openings, each symmetrically placed at the anterior border of the sternocleidomastoid muscle one inch above the sternoclavicular articulation. From each opening a thin clear fluid drained. A firm cord-like structure running parallel to the anterior margin of the sternocleidomastoid muscle could be palpated in each anterior triangle of the neck from the opening to the angle of the mandible. There were no enlarged cervical lymph glands. When the patient swallowed, each opening moved one-fourth of an inch upwards in the neck.

The mouth and pharynx appeared normal. There were no irregularities visible. The tonsillar fossæ were clear. The physical examination was otherwise negative.

Laboratory examination revealed a normal urine and blood picture. The Wassermann test was negative.

Roentgenograms were taken of the cervical region after the injection of lipiodol into each opening. Dr. Russell Morse, the roentgenologist, concluded that the sinus tracts passed superiorly from the external openings to the level of the base of the tongue on both sides and apparently the tract on the right side was higher than that on the left.

After the injection of the lipiodol the pharynx was inspected and no lipiodol was seen to have passed into the pharynx.

The patient was admitted to St. Barnabas Hospital during the Christmas vacation in 1934. On the operating table each opening was injected with methylene blue solution which appeared in the pharynx from each side through a small opening that was located on each posterior tonsillar pillar at the junction of the superior and middle thirds.

The left complete branchial fistula was operated first according to plan and the dissection of the right complete branchial fistula was done later. It was thought that a deep dissection of the neck could be better tolerated if one side at a time were done. If a com-

plication were to occur, such as infection, it would be easier to manage in case of a unilateral dissection.

A purse string suture was placed around the left external orifice and tied. A cuff of skin was excised with the external orifice. A longitudinal oblique incision was made over the fistulous tract from the external opening to below the angle of the mandible. The incision was carried through the skin, platysma and cervical fascia, exposing the fistula. The fistulous tract was dissected from below upward. The tract was located anteriorly and laterally to the carotid sheath. At the level of the hyoid bone the tract angulated toward the pharynx. The fistula passed under the posterior belly of the digastric muscle and between the external and internal carotid arteries. The glossopharyngeal, the vagus and the hypoglossal nerves were not visualized. The dissection of the fistula was carried to the pharyngeal mucous membrane. The inversion of the fistula at the internal orifice was carried out according to the method of von Hacker.¹⁹ The fistula was bisected leaving a half inch segment attached to the pharyngeal mucous membrane. A probe was passed through the internal orifice and fistula. The end of the fistula was attached to the probe and the fistula inverted into the pharynx when the probe was withdrawn. The fistula was ligated flush with the mucous membrane. The neck wound was sutured with interrupted sutures. A penrose drain was placed in the superior angle of the wound.

The right complete branchial fistula was operated during another vacation four months later. The same condition existed as was found on the left side. The same procedure was carried out. In attempting to invert the fistula at the internal orifice it was avulsed at the pharyngeal mucous membrane. The defect in the mucous membrane was repaired by two interrupted sutures.

The patient recovered uneventfully after each procedure and was discharged from the hospital each time on the fourth postoperative day.

Microscopic sections of the fistulæ were examined by Dr. Floyd Grave, the pathologist, who reported that the tract was lined with squamous and columnar epithelium. In some areas the columnar epithelium was ciliated. The epithelium was destroyed in places and replaced by scar tissue. Some sections showed a marked round cell infiltration of the wall of the fistula.

It has been seven years since the operation, and there has been no recurrence. The patient offers no complaints relative to the neck.

Although branchial fistulæ are congenital in origin only a small number are found at birth. They may appear at any time from childhood into adult life. Most of them make their appearance before the age of thirty. The delayed cases may represent internal incomplete fistulæ that break through externally or branchial cysts that break through or have been incised and allowed to drain forming an external draining sinus.

The fistulæ occur with about equal frequency on either side of the neck. There were 45 per cent on the right side and 47 per cent on the left, and 8 per cent were bilateral. In Ladd and Gross¹⁴ series, 37 per cent were on the right side, 58 per cent were on the left and 5 per cent bilateral. Hyndman and Light¹¹ found the right side involved in 52 per cent, the left in 31 per cent and bilateral in 17 per cent.

As to sex, the cases were about equally distributed between males and females. There were 44 per cent in males and 56 per cent in females. Hyndman and Light's¹¹ series closely parallel this, having 47 per cent in males and 53 per cent in females. Lahey and Nelson¹⁵ in their series reported a preponderance of cases in females, namely 70 per cent. These findings tend to refute the statement appearing so generally in the literature that branchial fistulæ are most frequent in females and that they are found on the left side in the majority of cases.

There seems to be hereditary tendency in some cases of branchial fistulæ. This is brought out only in the occasional case in most of the reported cases. It was observed by Virchow¹¹ in 1865 when he reported the condition occurring in a mother and her eight children; in a mother and her son in three instances; in a mother and daughter and two sisters, a brother and a maternal grandmother in one instance. Vaughn⁷ observed a young woman with bilateral fistulæ who had a daughter and a sister with fistula on the left side and a grandmother with one on the right side. Hyndman and Light¹¹ reported fistulæ occurring in a mother and in three of her five children. They concluded that the condition was inherited through the mothers, there having been no instance reported through the father. One of Carp and Stout's⁶ cases, however, was a girl with bilateral fistulæ whose father, brother and female cousin on the father's side had bilateral fistulæ. In 100 collected cases Fischer⁶ noted twenty-one with a hereditary tendency. This I believe is a rather high incidence. Bailey,¹ surgeon at the Royal Northern Hospital of London, who has had a large experience with branchial fistulæ, has had none with a hereditary factor.

Branchial fistulæ are classified as to type as follows: (1) *complete*, where the fistulous tract has an external opening on the surface of the neck and an internal opening in the pharynx;

(2) *external incomplete*, where there is only an external opening on the neck and the fistulous tract ends blindly in the neck structures; and (3) *internal incomplete*, in which there is only an internal opening in the pharynx and the fistula ends blindly in the neck. The complete fistula is the prototype and the others are the variants. The most common form is the external incomplete, and the rarest is the internal incomplete. There were 47 per cent of the external incomplete type, 39 per cent of the complete and 11 per cent of the internal incomplete type. The fistulæ may be unilateral or bilateral. In the series of 108 cases of branchial fistulæ there were nine in which the fistulæ occurred bilaterally. The case reported above was the only one that had a complete fistula occurring on each side of the neck.

The internal incomplete fistula is usually not found unless some complication occurs such as inflammation of the tract or retention of the secretory products of the tract lining which produces a swelling. A tonsillectomy may initiate the inflammatory reaction in the fistulous tract which has its opening in the tonsillar fossa. A swelling occurs in the neck that must be differentiated from an adenitis. Internal incomplete fistulæ which have produced this clinical sequence have been reported by Bailey¹ and Johnson.¹²

The external opening of these fistulæ occurs usually in the anterior triangle of the neck along a line running from the angle of the mandible to the sternoclavicular articulation. In 80 per cent of the cases the opening is in the lower third of the neck. However, the site of the opening may be any place from the level of the hyoid bone down to the sternum. The situation of the external opening is thought to be determined by the time in the embryonic life when the fistula had its origin. If it starts early in the development of the branchial apparatus the external opening will be higher in the neck than if its origin is later. It is uniformly agreed that the position of the external opening does not indicate what branchial or visceral groove was involved in the formation of the fistula. Variation from the usual location of the external opening in complete fistulæ has been noted. Semken¹⁹ reported a case where the external opening occurred on the side of the neck posterior to the sternocleidomastoid muscle. Atypical openings may represent internal incomplete fistula that

break through to the outside of the neck because of inflammatory changes.

Usually the fistulous openings have a single orifice. An interesting case was reported by Virchow¹¹ in which the fistula had multiple small openings on the right at the junction of the sternocleidomastoid muscle and the clavicle.

The external opening varies in size from a small pin-point orifice to 2 or 3 millimeters in diameters. The opening may be surrounded by pigmented skin. Cases have been reported which present a dimpling or a tab of skin containing cartilage at the external orifice. The external opening is usually of a smaller calibre than the fistulous tract above it. Inflammatory edema may occlude the opening and secretory and inflammatory products are thereby retained in the tract.

The drainage that occurs on the neck is the symptom for which these patients practically always seek relief. The drainage discharge may be a clear tenacious mucous or a turbid white or yellow fluid. The turbid fluid may be due to the desquamated epithelial elements or to the presence of pus in the infected cases. The drainage may be a continuous small amount or in some cases, an intermittent and more abundant amount. In complete fistula, fluids or solids may pass from the pharynx to the outside of the neck depending upon the calibre of the tract. Lesser⁷ observed a man with a complete fistula who could pass a curved probe from inside of the pharynx to the outer opening just above the sternoclavicular articulation, and withdraw it.

In those fistulæ which are adherent to the vagus nerve or which contain some of the vagus nerve fibers, the patients may present symptoms due to vagus irritation. A chronic nonproductive cough may be produced. Such a cough was relieved when Carp⁵ excised a fistula that was adherent to the vagus nerve. Hyndman and Light¹¹ reported a case of branchial fistula in which coughing, palpitation of the heart and vomiting were produced when the tract was probed. That the vagus nerve may be involved and vagal symptoms produced should always be considered when cervical fistulæ are probed or injected.

In the majority of branchial fistula cases there are inflammatory processes present. The external and internal orifices favor the introduction of infection, and the occurrence of inflammation in the tract or in the perifistulous tissues will bring

these patients to seek relief. The discharging orifices become reddened and tender. A tender cord-like structure may be produced in the neck or when a small orifice becomes obstructed, a mass may occur. Such a mass may vary in size because of an intermittent draining and emptying. An interesting case of an internal incomplete fistula was reported by Eddowes¹ in a nurse thirty years old in whom the fistula became periodically filled with purulent material. The toxic material undermined her health, causing a marked loss of weight. The condition was unrecognized for some time. When the fistula was removed she regained her health.

A fistula may be of various lengths. It may extend only a short distance, a few millimeters, from either an external or internal opening, or it may be a complete fistula. By the injection of colored solutions or solutions of recognizable taste it can be determined if an external orifice has a communicating tract with the pharynx. A colored solution may locate the position of an internal orifice which is usually hard to locate and many times is not recognizable. The extent and course of a tract can sometimes be visualized by injecting radiopaque substances, such as iodized oils or solutions or barium mixtures, and by taking roentgenograms of the neck region. The calibre and degree of sacculation of some tracts can be demonstrated. If the calibre of the sinus is small or narrowed in some segments it may be impossible to visualize the entire extent of the tract. Too much reliance should not be placed on a roentgenogram showing a partial fistula for the complete tract may not have been filled. Dowd⁸ visualized a complete branchial fistula by passing an opaque ureteral catheter and making roentgenograms. Hyndman and Light¹¹ utilized this procedure in one of their cases.

In the case of a complete fistula there will be, on deglutition, some recognizable changes in the external orifice. The fistulous cord will create traction on the orifice and adjacent skin causing it to move upwards or to retract, producing a dimpling. In most cases an indurated cord which runs upward from the external opening can be palpated in the neck.

Branchial fistulæ are usually lined with a well organized epithelium. In some a stratified squamous epithelium is found and in others the lining is made up of columnar epithelial cells which may be ciliated. Both types of epithelium

have been found in a single fistula. I cannot agree with those authors who state that the lining of fistulæ is always made up of columnar epithelium in contrast with branchial cysts which are always lined with squamous epithelium. Where there has been an inflammatory process in the tract the epithelium may be destroyed completely or in part and replaced by scar tissue.

The wall of the fistula contains areas of lymphoid tissue which may encircle the tract or be deposited in separate areas along the course of the fistula. Connective tissue and varying amounts of smooth and striated muscle fibres will also be found in the wall. In isolated cases there are nerve fibres, cartilaginous remnants and secretory glands in the wall of the fistula.

The fistulous wall usually is not uniform in thickness. It may be very thin in places and at other places thick. The lining membrane often has deep crypts or infoldings which produce a marked irregularity in the calibre. In some cases these crypts may be so deep that they appear as diverticula and extend away from the fistula. Carp and Stout⁶ observed a case where microscopic sections showed numerous accessory tracts lined with epithelium similar to the main tract and lying adjacent to it.

Branchial fistulæ must be differentiated from tuberculous adenitis with a sinus and from atypical thyroglossal duct fistula. A tuberculous sinus in the neck will usually be associated with several enlarged cervical lymph glands. The discharge from a branchial fistula will be mucoid or mucopurulent while in a tuberculous sinus it will be serous or seropurulent. In the case of a fistula, examination of the discharge may show the epithelial elements while in a tuberculosis sinus acid-fast bacilli may be found. By examining the external orifice with a hand lens the mucous membrane lining can sometimes be recognized in a branchial fistula while in the tuberculosis sinus there is no epithelial lining.

Thyroglossal duct fistula has occurred in one of the anterior triangles of the neck. The external orifice has been situated laterally from the midline which is not its usual location. The course of the fistula may be determined by probing or by taking roentgenograms after the tract has been filled with a radiopaque substance. The thyroglossal duct fistula will be associated with the mid portion of the hyoid bone while a branchial fistula lies laterally to the bone.

The treatment of branchial fistulæ is the total surgical extirpation of the tract. If this is not accomplished there is apt to be recurrence. The procedure may be easy or extremely difficult. A dissection of a short external incomplete fistula usually offers no difficulty. It must be realized that what may clinically appear to be a short fistula may be of greater extent when the dissection is attempted, and one must be prepared to carry out a complete dissection to the pharynx.

The operation may be performed through an oblique incision running parallel to the anterior margin of the sternocleidomastoid muscle. The incision is made directly over the tract and extends from the external orifice to the level of the hyoid bone if it becomes necessary to expose a complete fistula. Bailey¹ advocates the "stair step" incisions. An oblique transverse incision is made at the level of the external opening; a second one is made at the level of the hyoid bone. The tract is dissected upward underneath the skin to the second incision, the contention being that a better cosmetic result is obtained with these incisions.

To facilitate the dissection of the fistula, several procedures have been devised. The fistulous tract has been fixed by a probe or by a ureteral catheter. The fistula has been filled and distended by fluid, oil or paraffin. With the use of methylene blue the course of the tract can be ascertained and, if an irregularity is cut across, it will be easily visualized. Love⁴ encircled the external orifice with a purse string suture a few days preceding the operation to allow the tract to become distended with secretion.

In some cases to get adequate exposure of the upper end of the fistula as it approaches the pharynx, the fascia, covering the posterior belly of the digastric muscle, may be incised in the long axis to free the muscle belly from its inner sheath. The muscle can be retracted upward producing a wider space to carry on the deep dissection and making it easier to identify the vascular and nerve structures.

There is a difference of opinion as to what is necessary in removing the inner orifice of a complete fistula. Ladd and Gross¹⁴ consider it necessary to carry the dissection of the fistula only up to the mucous membrane of the pharynx and removing the fistula two or three millimeters from the pharyngeal mucous membrane and tying

it. Others remove the tract flush with the pharyngeal mucous membrane and do not consider it necessary to suture the area but allow the tissues to fall together. The inversion of the fistula, according to the method of von Hacker,¹⁹ was described in the case report. In cases where the perifistulous tissues are indurated and do not allow the inversion of the tract, a cuff of pharyngeal mucous membrane may be excised along with the internal orifice and the defect sutured. In fistulæ Koenig⁷ could not invert, he tunneled under the mucous membrane and placed a short segment of the tract anteriorly from the internal orifice. The opening of the short segment was fixed at the level of the pharyngeal mucous membrane leaving two fistulous opening connected with a short tract in the pharynx.

The contents of a fistula must be considered contaminated and spilling should be avoided. The dissection should be so carried out that the fistulous cord contains all of the tract and the dissection must be wide enough so that accessory ducts or irregularities are not cut across. The usual course of a complete fistula lies under the platysma and outer layer of the middle cervical fascia and upon the sternohyoid and sternothyroid muscles. The fistula courses laterally to the internal jugular vein and common carotid artery. At the level of the hyoid bone the fistula changes the direction of its course and angulates to approach the pharynx. At this level it passes beneath the posterior belly of the digastric muscle and between the external and internal carotid arteries which lie anteriorly and posteriorly respectively. The fistula passes over the hypoglossal (XII) and glossopharyngeal (IX) nerves and under the styloglossus muscle to end in the tonsillar recess of the pharynx.

It is generally agreed that the treatment of branchial fistula by the injection of escharotics is not dependable. It is practically impossible to inject a fistula so that the entire lining is in contact with the solution because of the infoldings of the epithelial lining and the occurrence

of accessory tracts. A narrowed segment may obstruct the filling of the tract. The thickness of the epithelial lining and of the wall of the fistula varies. Solutions necessary to destroy the thick portions will perforate the thin portions of the wall and cause inflammatory changes in the perifistulous tissues. Lahey and Nelson¹⁵ state that the danger of perforation of the pharynx by necrosis and the marked inflammatory reaction which may result are objections to this type of treatment.

Summary

1. A case of bilateral complete branchial fistulæ is reported.
2. A brief historical review of branchial fistulæ is given.
3. The embryology of the branchial region is reviewed.

EVALUATION OF RECENT DATA ON BOILED LIVER EXTRACT METHOD OF TREATING ACNE VULGARIS

WALLACE MARSHALL, M.D.

Appleton, Wisconsin

SEVERAL recent articles have appeared in the current literature which have used the author's method of treating acne vulgaris with boiled liver extract. Boreen¹ concluded that the "treatment with boiled liver extract has been disappointing." This investigator had a series of cases which numbered fifty patients. Of these, twenty showed no improvement, twenty-three improved slightly, and seven were improved considerably. This work was completed in the University of Minnesota Students' Health Service on presumably physically normal students. In all, thirty patients showed some form of improvement (60 per cent), while 40 per cent showed no signs of improvement.

In contrast to this series of findings on otherwise healthy patients, a recent article by Lichtenstein and Stillians has been published.² These clinicians chose tuberculous patients with concomitant acne vulgaris in order to put the author's method to a "rather severe test of the liver extract method of treatment," for they observed that "not only were we treating patients whose powers of resistance were lowered by disease, but we were competing with a diet ideal for the promotion of acne vulgaris." Their series of cases numbered fifty patients. They found that 21 per cent of the patients were greatly improved, 14 per cent were moderately improved, while 14 per cent were slightly improved, and 45 per cent received no benefit. They used no adjunct therapy during the test period. However, for the average run of cases, they advise combined therapy with such adjuncts as ultraviolet irradiation and lotions, since the liver extract method, when used alone, produces improvement slowly. These observers feel that they have demonstrated a definite action of the modified liver extract in certain cases of acne vulgaris in spite of a concomitant pulmonary tuberculosis.

A word of caution to future investigators may not be amiss at this moment. In a portion of the above series of cases, Lichtenstein and Stillians used a "modified" liver extract which was boiled.

It is important to stress the fact that this material, which they used, was prepared for them by Professor Farmer and myself in the Department of Biochemistry at Northwestern University Medical School. This particular fraction, which was supplied to these investigators, was prepared each week. It is not available through commercial sources, nor are facilities available at this time to supply other clinicians with a similar fraction.

Another point should be explained. There are numerous types of liver extracts on the market which are available to the profession. These products vary in their chemical and physical properties, and because of this reason, caution should be exercised in choosing the proper type of material to be used according to the boiling technique which has been advocated by the author.³ The various procedures which are employed by the various pharmaceutical firms in order to render their products more potent, as exemplified by the U. S. P. dosage, may remove the apparent factor which the liver extract contains and which apparently brings about clinical improvement when the material is administered to patients with acne vulgaris. In other words, if one wishes to employ the original boiling technique,³ it may be well to obtain the so-called *crude* liver extract, or the material which contains a minimum amount of U. S. P. units per cubic centimeter. Most of these crude liver extracts contain but one or two U. S. P. units per cubic centimeter. Such products can be obtained from the Eli Lilly Company, Lakeside Laboratories, from the Abbott Laboratories, or from other ethical and reliable pharmaceutical firms. If the above precaution is followed, perhaps much misunderstanding on this matter may be averted.

For my most recent investigations, I have been using a fraction which is different from that which was supplied to Doctors Lichtenstein and Stillians. It is hoped that this data, on this most recent research, may be made available in printed form in the near future. Suffice it to say at this time, these results appear promising and so far

have been without untoward local or systemic reactions, which have been experienced previously with the use of crude and boiled liver extract.⁴ For this important reason, caution should be exercised if a patient becomes hypersensitive to any type of liver extract when it is administered parenterally. In such a case, further treatment with this medication is contra-indicated. However, further treatment with liver extract by mouth can be tried with care. Various suitable commercial oral liver extracts in a capsular form are available for this use.

OCULAR MANIFESTATIONS OF SOME CONSTITUTIONAL DISTURBANCES

GEORGE L. LOOMIS, M.D.

Winona, Minnesota

IT IS a well-established fact that the eye is most important clinically for purposes of diagnosis. The physician often sees a patient who will, on first glance, call to mind some associated constitutional disturbance whether it be hereditary, endocrine, neurogenic, metastatic, or purely functional. Many of our patients complain about their eyes before other parts of the body become involved. To ignore these complaints and to overlook diagnostic points will often delay the physician in arriving at the proper diagnosis, whereas familiarity with some of the more common ocular conditions will many times give one a valuable lead.

During the year 1941, several patients presented themselves for treatment, complaining of difficult near and distant vision. A routine refraction brought out no evidence of any underlying fundus disease which would cause one to recommend blood and urine examinations or seek medical or neurological consultation. Vision in all but one patient was brought to normal with lenses and they were advised to return for a checkup after wearing the glasses. In all cases they returned as ordered, at intervals of two weeks to six weeks. The immediate reaction in three cases was to throw the glasses on the desk

and complain that they could not see with them. Examination revealed that vision had decreased markedly since the previous visit. Fundus examination was still normal but fields now showed a marked contraction. Search was then made for the primary cause of the patients' sudden loss of vision.

Case 1.—Q. N., white male, aged thirty-eight, by occupation a barber, was first seen on February 26, 1941, complaining of difficulty with close work. He was corrected fully for both near and distant vision. On March 10, he returned complaining that he was very uncomfortable. Vision was reduced to R. 20/60, L. 20/40. There was no fundus change to account for this sudden loss. He was sent to his family physician who found three plus sugar on urine analysis. Proper therapy was begun and immediate improvement was noticed. The difficulty for close work was due to temporary loss of accommodation brought on by the diabetes. It was necessary to cut the strength of his hyperopic correction nearly 50 per cent after which all complaints ceased. No visible ocular changes developed.

Case 2.—D. P., white male, aged fifty-five, had for many years been a well-controlled diabetic. In 1938, he had normal vision with glasses. In March, 1941, a routine refraction revealed a slight diminution in vision, R. 20/30, L. 20/25. His glasses were changed. Peripheral fields were practically normal. Because of the diabetic history, he was accustomed to having a complete physical checkup every year. This was done and nothing new found. On July 7, 1941, the patient re-

Read before the annual meeting of Wabasha and Winona County Medical Societies at Buena Vista Sanatorium, April 13, 1942.

turned complaining of inability to see with his glasses. Vision was now, R. 20/100, L. 20/50. Peripheral fields had not changed much but a central scotoma for red was found on the right. He had noticed difficulty in seeing at night and had trouble interpreting traffic lights.

Fig. 1. Case 4. Myasthenia gravis. Attempt is being made to wrinkle forehead causing a convergent squint of left eye.

Search into the history revealed that the patient had smoked eight to ten cigars daily for over twenty years and had been accustomed to having one or two highballs every night for an equal period of time. Complete alcohol and tobacco abstinence was advised and the patient was given 50 mg. doses of thiamin parenterally and also large doses of B-complex orally. The improvement in vision took place quickly. Field changes improved more slowly. The latest examination in March, 1942, showed the scotoma still present but smaller. The vision had improved to 20/25 in each eye. The patient hadn't smoked for eight months, and had reduced his alcohol intake to a minimum. His only complaint was the fifteen-pound gain in weight from the improved appetite associated with Vitamin B therapy and cessation of smoking.

Case 3.—X. C., white male, aged forty-five, by occupation a barber, complained in October, 1941, of inability to cut hair well because of poor vision and he wanted a pair of glasses to relieve this. The usual examination for glasses revealed a presbyopic condition about normal for his age. The patient was instructed to use glasses for reading only. He returned in one month complaining that he could not use glasses as they made him sick. Field studies were made showing centrocaecal scotoma, typical of alcohol-tobacco amblyopia. Further history brought out the fact that the patient smoked two packages of cigarettes daily and was accustomed to having eight to twelve drinks daily for many years. A careful medical checkup was advised and revealed peripheral neuritis, an enlarged liver and marked nervous irritability. His physician instituted treatment for the alcohol-tobacco amblyopia similar to that in Case 2. He was also placed on a high fat, high vitamin diet, and hospitalized for two weeks to get him into a suitable regime. Improvement was slow and it was not until February, 1942, that

the patient was able to resume his normal duties. He reported in March that he was feeling fine and having no more trouble. This is too short a period of observation, however, to feel sure of the outcome.

Case 4.—Mrs. E. L., white female, aged forty, was seen in March, 1941, complaining of headaches and twitching of the eyes. She was given a routine refraction on March 31 and was relieved of symptoms with glasses. At this time a complete medical history would have elicited some interesting findings but none was taken. The patient returned in November, 1941, with headaches and a coincident acute sinusitis which confused the picture somewhat. She was slow to recover from the sinus infection and soon began to complain of extreme weakness. The history now brought out the fact this weakness had been coming on for over two years. Her facial expression was very dull; a partial ptosis of both lids was present; diplopia was present at times; it was impossible for her to wrinkle up her forehead and on so attempting a marked convergent squint developed. Visual fields were taken which showed a depression peripherally. This is not in accord with the usual findings of most authorities. Large doses of thiamin intramuscularly brought sudden, but not lasting improvement. The puzzle over the diagnosis began to clear up especially after the intramuscular therapy was changed to prostigmin. The patient was referred to a neurologist who confirmed the diagnosis of atypical myasthenia gravis. Prostigmin orally 15-30 mg. t.i.d. and 1 c.c. of 1:2000 prostigmin intramuscularly twice weekly enables the patient to continue with her normal activities. The unusual features are the convergent squint rather than the more common divergent type and the involvement of the peripheral fields.

Case 5.—This patient, white male, aged fifty, was refracted in November, 1941, and vision brought up to normal with glasses for both distance and near. He returned in December with a marked loss of vision and involvement of visual fields. He admitted on questioning to have a lighted pipe in his mouth eight hours a day and also stopped in for several drinks on the way home every night. His family physician found a mild diabetes along with the tobacco-alcohol amblyopia. The diabetes is under control, but in April, 1942, the vision was still 20/200 right and 20/50 left, showing that the toxic amblyopia will be slow to improve.

The preceding cases are all examples of optic nerve affections. Alcohol and tobacco as exogenous toxins go together as common causes of toxic amblyopia. There is no definite evidence as to the site of the lesion in this condition. About all that one can say is that tobacco in certain individuals seems to affect definite nerve elements since no other disease produces this type of field change, that is, the centrocaecal type of scotoma with depression for red and green. Since Amer-

ica has been drinking better liquor, alcohol amblyopia per se should become a rarity. Traquair² states that, apart from tobacco, pure alcohol amblyopia is almost unknown in England. It appears to be the fusel oil, acids, aldehydes and furfurals which contain the toxic factors. The incidence of the disease depends on the quality, not the amount, of alcohol consumed. Diabetes, according to the same authority, is not a particular cause of amblyopia, although there are present endogenous toxins which produce field changes. However, any illness may cause the development of amblyopia if enough tobacco is consumed.

Myasthenia gravis is interesting to oculists because of its predisposition to involving ocular and facial muscles, giving the diagnostic sad appearance, with ptosis, dysphagia and diplopia. No at-

tempt will be made to discuss the theories of its etiology and treatment. Only one authority mentions visual field changes in this disease and then only as "transient concentric constriction."

Summary and Conclusion

The purpose of this paper has been to stress the diagnostic importance of sudden visual changes and contraction of visual fields. In all these cases the pathological changes had no doubt been going on for some time, yet were undetected in a routine refraction.

A WORD OF WARNING

When sulfadiazine was introduced to the medical profession, it was accepted with alacrity and enthusiasm. And small wonder, for early studies on the toxicity of the drug suggested that it had the desirable qualities of sulfapyridine and sulfathiazole but fewer toxic effects. There was less acetylation, the factor that made for urolithiasis, and hence it was a safer drug as far as renal excretion was concerned. This, together with its lesser gastrointestinal irritation, its less frequent and less marked cyanosis, and its fewer toxic effects on the bone marrow, led to a wider use of the drug. In some instances, lulled into a false sense of security, physicians may have given the drug indiscriminately and in doses excessive for conditions not warranting drastic treatment.

Reports of serious renal complications are now steadily accumulating.^{1,2,3,4} This was virtually predicted on the basis of animal experiments by two groups of

laboratory investigators^{5,6} who demonstrated the frequent occurrence in rats of urolithiasis following sulfadiazine therapy. Now we have pathologic evidence in the human that acetylated sulfadiazine crystals may accumulate in the renal tubules, with degeneration and necrosis of the tubules and surrounding tissue. A zone of inflammation, associated with hemorrhage, may surround the deposited crystals. Anuria and death, as a result of this, have been reported in several instances. It seems that while acetylation of sulfadiazine is of a lesser magnitude than that of the other sulfa drugs, it may have a more damaging effect on the renal tubules and the adjacent involved renal tissue.

Two lessons are to be learned from these reports and their pathologic findings. Sulfadiazine should be used only when genuinely indicated and for as short a period as possible. Not only the blood but the urine should be frequently examined, preferably daily. When microscopic hematuria appears, the drug should be continued only in cases of dire necessity. If urinary secretion is decreasing, fluids should be forced, intravenously if need be, and alkalis should be administered for greater solubility of the crystals. If ureteral obstruction has taken place, early catheterization of the ureter should be done. The best treatment is prevention—by judicious use of the drug, and careful, expectant observation for danger signals.—Editorial, *New York State Journal of Medicine*, September, 1942.

THE TUBERCULOSIS PROGRAM OF THE MINNESOTA STATE MEDICAL ASSOCIATION

At the first annual meeting of the Minnesota State Medical Association in February, 1870, the tuberculosis work was assigned to the Committee on Epidemics, Climatology, and Hygiene. It remained with this committee until June, 1894, when a special committee on tuberculosis was appointed. An excellent report was made in 1895, after which the committee was continued.

About 1925 a number of Minnesota physicians began an extensive educational campaign. Many who volunteered to assist traveled over the state for several years and spoke before all of the medical societies on one or more occasions. They participated in numerous special short courses on tuberculosis for physicians. Through an affiliation with the Minnesota Public Health Association they also spoke before large numbers of lay groups in schools, churches, et cetera. All of this was done for the purpose of acquainting the medical profession, as well as the public, with the modern viewpoint of tuberculosis control.

In 1931 the tuberculosis work of the State Medical Association was carried on as a part of the activities of the Public Health Education Committee and in 1934 a sub-committee on tuberculosis was appointed. In 1941 this became an independent scientific committee.

In 1939 a statewide campaign against tuberculosis was instituted by the State Medical Association. We are deeply indebted to Dr. Chester A. Stewart, who was then a Councilor, for precipitating action of the Council and providing splendid support for the Committee on Tuberculosis.

Several meetings of the Committee were devoted to the fundamentals of diagnosis, treatment, and prevention of tuberculosis, in order that the Committee might recommend the procedures which are standard and practical for the physicians of Minnesota. It is the opinion of the Committee that the medical profession of Minnesota has available all the information necessary and all the required facilities to control tuberculosis.

Fundamental and Standard Procedures in Tuberculosis Control

Diagnosis

The Tuberculin Test

Kinds of Tuberculin.—Old Tuberculin contains the various fractions of tubercle bacilli, such as the carbohydrates and protein. It is only the protein to which the human tissues become sensitized. Despite the claims of the opponents of tuberculin testing, Old Tuberculin contains no tubercle bacilli either alive or dead; therefore, there is no possibility whatsoever of tuberculosis being contracted from tuberculin. *Purified Protein Derivative*, as the name indicates, consists only of the protein of tubercle bacilli.

Where May Tuberculin Be Procured?—The Minnesota Department of Health and some local health departments are equipped to provide without charge to all physicians in the state Old Tuberculin in the proper dilution for immediate administration. Purified Protein Derivative may be obtained from drug houses.

Method of Administration.—Numerous methods of administering tuberculin have been devised, such as: (1) applying it directly to a superficial scarification of the skin, as recommended by Pirquet; (2) applying it directly to the skin without producing a scarification, as was originally recommended by Moro and Lautier, and more recently by Wolff under the name of the tape test, and Vollmer under the name of the patch test; (3) introducing tuberculin in proper dilution directly into the layers of the skin. This last method is known as the intracutaneous or intradermal test of Mantoux. *This has become the standard method because of the measured dosage, the accurate placing of tuberculin where it is desired, and the speed with which it can be administered.* The only objection to this method is the use of a needle and the injection of a substance into the skin. To give such an objection consideration is a paradox, since we must use the same procedure to determine the presence or absence of immunity to diphtheria and scarlet fever. Moreover, a hypodermic syringe must be used in producing artificial immunity in these diseases and in withdrawing blood for various tests.

Dosage.—The initial test dose of Old Tuberculin consists of 0.1 cubic centimeter of a dilution of one part of tuberculin to 999 parts of diluent. This amount contains 0.1 milligram of tuberculin. For those who do not react to this initial test a second dose is administered, consisting of 0.1 cubic centimeter of a dilution of one part of tuberculin to ninety-nine parts of diluent (these dilutions are prepared and delivered ready to administer by the State Department of Health). This amount contains one milligram of tuberculin. If no reaction occurs, one is safe in stating that living tubercle bacilli are not present in the body.

Time of Interpreting the Test.—The Committee strongly recommends that all tuberculin tests be interpreted seventy-two hours after administration, since changes in the appearance of the skin due to trauma, etc., have usually disappeared at that time and also delayed reactions to tuberculin may have appeared. A characteristic tuberculin reaction remains longer than seventy-two hours.

What Constitutes a Tuberculin Reaction?—An area of induration or edema of the skin five or more millimeters in diameter at the site of administration is necessary to classify the tested individual as a reactor. This may or may not be surrounded by an area of hyperemia. Small areas of redness or pinkness of the

Submitted by the Committee on Tuberculosis of the Minnesota State Medical Association.

skin or shot-like nodules at the point of administration should never be interpreted as reactions to tuberculin.

Intensity of Tuberculin Reaction.—Generally speaking, the more recent the tuberculous infection, the higher the degree of sensitivity to tuberculin. So far as is known, there is no relationship between the intensity of reaction and extent of disease except in terminal cases. An individual with only microscopic lesions may have more sensitive tissues than one with gross areas of disease. Therefore, there is no advantage in grading tuberculin reactions into 1, 2, 3, and 4 plus; it suffices to determine only the presence or absence of the characteristic reaction.

How Often Should the Tuberculin Test Be Administered?—Until recently it was believed that the individual who becomes a reactor to tuberculin is always a reactor. However, it has been found that in the bodies of some persons all tubercle bacilli die and the tissues lose their sensitivity to tuberculin. It has not been determined how frequently this occurs or how long an interval is required. Because it is an established fact, however, the individual who reacts to tuberculin should be retested every three or four years. All persons who do not react to the usual second dose of tuberculin should be retested at least annually.

When Does the Tuberculin Test Fail?—After the primary tuberculosis complex begins to develop, it requires from three to seven weeks before the tissues become sufficiently sensitized to tuberculo-protein to react to tuberculin by the usual method of administration. In some persons all tubercle bacilli die but the sensitivity of the tissues apparently persists for a few weeks thereafter. When tuberculosis approaches the terminal stage, whether it is acute or chronic, the tissues apparently become somewhat desensitized and may not react to tuberculin except when a large dose is administered. Aside from these exceptions the tuberculin reaction is almost 100 per cent accurate in determining the presence or absence of tubercle bacilli in the human body.

Who Should Be Tested With Tuberculin?—The belief that only children should be tested with tuberculin is obsolete. Today there is no age level at which tuberculin testing is not of value. The test should be administered to all persons from infancy through senility. In the state of Minnesota the annual infection attack rate is 1 per cent or less; that is, among infants who have attained the age of one year, only one in 100 has been infected and, therefore, reacts to tuberculin. In some parts of the state the attack rate is less than one-half of 1 per cent each year. Therefore, since the span of life is in the neighborhood of sixty-four years it is obvious that with an annual attack rate of 1 per cent or less, far more persons become infected with tubercle bacilli for the first time in adult life than in childhood and many completely escape infection. Thus, the tuberculin test should be used among persons of all ages.

The Meaning of the Tuberculin Reaction.—When a characteristic tuberculin reaction is present, it means there are living tubercle bacilli in the body with the above exceptions. Since it is only tubercle bacilli that cause tuberculosis, it is significant to know when these organisms are present. They may already have produced clinical disease or if not they may cause it to develop at any subsequent time. Therefore, the test serves to screen out those persons from any group who already have or are potential cases of clinical tuberculosis. With the above exceptions, the absence of a tuberculin reaction is excellent evidence that living tubercle bacilli are not present in the body.

Practical Significance of the Tuberculin Test.—The tuberculin reaction provides the physician with two extremely important and practical facts. 1. It promptly determines that the reactor has been in contact either directly or indirectly with a contagious case of tuberculosis. (Infection from animals, particularly cattle, has become a rarity in Minnesota.) Often such cases are unsuspected, since the responsible individual is not ill: therefore, the examination of adult contacts frequently brings to light persons with contagious tuberculous lesions who have good working capacities, as well as those who believe they have only such conditions as asthma and bronchitis. Obviously, the more recent the infection, the greater the likelihood of finding the contagious case among the adult associates. (Children disseminate tubercle bacilli to others with great rarity.) For example, when a child between birth and six or seven years of age is found to react, the physician who searches for the source of the infection often finds it in a member of the immediate household; the younger the child, the greater the likelihood of finding the contagious case. Likewise, when older children and adults are tested periodically and an individual who was a non-reactor a year ago is found to react today, it is obvious that some adult contact during that year had contagious tuberculosis and careful investigation often discloses the spreader of tubercle bacilli. Thus, the tuberculin test is our most valuable epidemiological agent.

2. Since the tuberculin reaction determines the presence of living tubercle bacilli in the individual's body, it indicates an immediate adequate examination of the reactor for clinical tuberculosis, not only in the lungs but in all parts of the body in which this disease is frequently found. If clinical disease is not located the reactor should be examined in a similar manner at least annually.

X-Ray

The roentgen-ray is of great value in detecting areas of disease in certain parts of the lungs, after they have become macroscopic in size and before they are sufficiently large to cause symptoms. However, no phase of x-ray inspection is a substitute for the tuberculin test, in any sense of the word. Nevertheless, every tuberculin reactor should have periodic x-ray inspection of the chest. Chronic tuberculous lesions in the lungs often cast x-ray shadows two or three years before significant symptoms appear.

TUBERCULOSIS PROGRAM

Methods of Using the Roentgen-Ray.—Fluoroscopy is valuable, particularly in inspecting the chests of small or thin individuals. It permits one to visualize nearly all of the lung when the chest is properly rotated and, thus, shadows may be seen which are obscured from view on x-ray films by the heart, diaphragm, and other structures. Many physicians are not able to take the necessary time to accommodate the eyes for fluoroscopic inspection of the chest and, thus, much is overlooked which might otherwise be visualized. Fluoroscopic inspection is not as satisfactory as the x-ray film for detail; moreover, no record of shadow is made which may be compared with subsequent inspections. Therefore, it is recommended that x-ray film be used whenever possible but in the absence of adequate facilities the fluoroscope may be used to great advantage.

Photofluorograms made by photographing the images from the fluorescent screen are now being made on 35 millimeter and 4x5-inch film. The cost of these films is small but the necessary equipment for exposing them is expensive. The Committee does not feel that these films have yet been demonstrated to be of sufficient value to take the place of the 14x17-inch film.

X-Ray Film.—Standard size, 14x17-inch x-ray film, either celluloid or paper, should be used whenever possible to inspect the chests of tuberculin reactors. Several members of the Committee have had extensive experience with both celluloid and paper film and have found them equally good in detecting shadows of disease. Therefore, the choice of film is left entirely to the physician's judgment. However, no film should be made except with standard technique, so well executed that the usual normal lung markings are clearly visible on the finished product. These films should be preserved not for five years but indefinitely, regardless of whether they show any evidence of disease, in order that they may be compared with films made subsequently. The tuberculin reactors whose x-ray films reveal no evidence of disease in the lung on the first inspection may at any subsequent time develop one or more pulmonary lesions.

Unfortunately, the x-ray film of the chest possesses certain disadvantages in the detection of tuberculosis: 1. There are several pulmonary diseases which cast identical shadows; therefore, etiological diagnosis from x-ray shadows cannot be made with a high degree of accuracy. 2. Only 75 per cent of the lungs is visualized on the usual single x-ray film of the chest; the remainder is obscured from view by shadows of other structures, particularly the heart and diaphragm. 3. Extra-pulmonary clinical tuberculosis is not uncommon in persons whose lungs appear clear on x-ray film inspection.

Who Should Have X-ray Film Inspection of the Chest?—Chronic pulmonary tuberculosis is such a rarity in children from birth to high school age that there is almost nothing to be gained by inspecting with x-ray the chests of even the reactors to tuberculin. However, with the beginning of the period of adolescence, x-ray

film inspection should be made periodically of the chest of every reactor. There is no age level at which this work should be stopped, as long as the individual reacts to tuberculin. Persons whose lungs have been clear throughout the earlier decades may, and often do, develop chronic, pulmonary tuberculosis in the later decades of adult life. Whether or not a physician limits his work to x-ray, he should describe shadows and list the possible etiological factors but never attempt a final diagnosis from the film alone.

Clinical and Laboratory Examinations

The tuberculin test screens out those persons who have living tubercle bacilli in their bodies. The x-ray film inspection of the chest serves only to screen out those persons who have macroscopic lesions in the visualized part of the lungs, which may be tuberculous. Therefore, persons with such lesions should be carefully examined to determine etiology. Many individuals with lung lesions are entirely free from symptoms and abnormal physical signs. If sputum is present, it should be carefully examined for the various organisms which may be responsible for the lesion, particularly acid-fast bacilli. If no sputum is available, gastric lavage is helpful. This is done by administering by mouth 200 c.c. of water before breakfast. A few minutes later the gastric contents are removed, centrifuged, and the sediment examined for acid-fast organisms. A guinea pig should also be inoculated with some of the sediment. This aids in determining whether the acid-fast organisms seen through the microscope are pathogenic. It may also reveal the presence of tubercle bacilli even though they have not been detected by direct microscopic inspection. If tubercle bacilli are not recovered in this manner, one may need to resort to periodic inspection of the shadow on x-ray films. If a shadow is cast by an acute lesion, such as pneumonia, it usually disappears within a month; if it persists longer than four or five weeks it is probably due to one of the more chronic diseases, such as those caused by fungi or tubercle bacilli, and may even be malignant. Bronchoscopic inspection and the procurement of material for biopsy may be necessary. When malignancy is suspected this should be done at the earliest possible moment.

Management of Tuberculous Patients

Tuberculosis begins in the human body when tubercle bacilli are first ingested by neutrophils and are focalized at certain points where tubercle formation occurs. It may never develop beyond the lesions of the primary complexes. On the other hand, it may at any time develop to proportions resulting in illness and death. This terminal event may follow a long succession of remissions and exacerbations extending over many years or several decades.

One of our chief difficulties has been that we have not recognized the presence of tuberculosis until it produced symptoms to the point of causing incapacity. Thus, we have used the word "tuberculosis" synonymously with "consumption." It is only when we recognize tuberculosis as a disease from its very beginning,

TUBERCULOSIS PROGRAM

when its presence is manifested only by the tuberculin test, that we will be in a position to properly manage the disease in a given individual or among the persons of a community. Therefore, the management of tuberculosis in a community or a county consists, first, of determining which persons react to tuberculin at a given time, as well as those who subsequently become reactors. No matter how clear the films of the chests of these persons appear or how well they are, some of them will later develop clinical lesions in the lungs or elsewhere; therefore, the proper management of the group with no manifestations of tuberculosis except the tuberculin reaction consists of keeping them under close observation; that is, making examinations at least annually for the presence of clinical lesions. When such lesions appear in the lungs they can usually be detected long before they cause illness or eliminate tubercle bacilli through the sputum. At this time they can usually be controlled and prevented from causing illness or becoming contagious to others. Moreover, this can be done with little inconvenience or loss of time to the patient.

Among tuberculin reactors a group will usually be found who on the first examination have tuberculous lesions in the pre-symptom and pre-contagious stage. They can be treated in the same manner.

Another group will be found that already has disease so extensive that the lesions are eliminating tubercle bacilli and some symptoms are present. Such persons should be isolated at the earliest possible moment, preferably in institutions. The sanatoriums in the state of Minnesota were built primarily for isolating contagious cases of tuberculosis and, secondarily, for saving as many lives as possible. To date such a high percentage of patients admitted have had tuberculosis so advanced that the majority could not be fully restored to health. Nevertheless, without the sanatoriums of Minnesota the present encouraging situation could not have been possible.

Only a few years ago most of our sanatoriums had long lists of patients desiring admission; today several of them have vacant beds. Therefore, those persons who are found to have contagious tuberculosis can promptly be removed from their communities and isolated in institutions as long as their disease is contagious.

The physician in private practice, therefore, has a large role to play in the management of tuberculosis in his community even among those who must be sent to sanatoriums. He sees them during the pre-sanatorium period and must take care of those who return from the institution. Thus, the local physicians of a county are in a position to control tuberculosis by preventing persons with contagious disease from spreading tubercle bacilli to others and preventing most tuberculin reactors from developing contagious disease.

Physicians Should Assume Leadership in Local Health Problems

The Committee believes that the local medical profession should be active in the control of tuberculosis in each county. The diagnostic, therapeutic, and preventive work has been so standardized that it can be

carried on by all physicians who are willing to become interested and to devote a reasonable amount of time to it in their offices and their communities. Survey methods, conducted in cooperation with the local medical profession, to discover tuberculosis, are usually of value in finding cases and for public education. When adequate x-ray equipment and laboratory facilities do not exist in the local offices of physicians or the hospitals, it may be practical to introduce x-ray devices, etc., when the same is approved by the local medical profession. It is only in this manner that tuberculosis work can be adequately conducted and perpetuated to the point of bringing the disease to the irreducible minimum in the shortest possible time. The state of Minnesota now possesses adequate facilities for isolating contagious cases of tuberculosis; indeed, we have many vacant beds in our sanatoriums. The physicians in private practice are qualified to treat the non-contagious cases. Thus, the medical profession has at hand every necessary facility to control tuberculosis.

Control of Tuberculosis on the County Area Plan

To try to develop a tuberculosis control program on a state-wide basis at once did not seem feasible. Therefore, the Committee decided the problem would be simplified by working on the county area plan. It was thought best to select a demonstration county from which the work could extend to others. Several counties were considered with reference to such factors as population, financial rating, physicians, nurses, welfare workers, tax delinquencies, tuberculosis mortality, and previous tuberculosis work accomplished, as well as present interest manifested. On August 1, 1940, Meeker County was the unanimous choice of the Committee. On August 19, representatives of the Committee met with the physicians practicing in Meeker County, who without exception approved the plan and expressed a desire to control tuberculosis at the earliest possible moment. Following that date until September, 1941, nearly all regular meetings of the Tuberculosis Committee were held at Litchfield, with the physicians practicing in Meeker County. Considerable time was spent in the discussion of the program and the actual procedure. As far as we know, this is the first time that a county medical group has sponsored a complete tuberculosis control program and we have been unable to find anywhere the record of a finer spirit of cooperation among physicians than that manifested by the Meeker County group.

The Meeker County Program

1. It was decided that the first step in the program should be the administration of the tuberculin test to persons of all ages among the total population of approximately 20,000. This would immediately divide the population into two groups: (a) Those who do not have tubercle bacilli in their bodies. These persons, together with those who move into the county and those subsequently born, to be tested annually as long as they do not react. (b) Those who have already developed the primary tuberculosis complex and, thus, have previously been exposed to contagious cases of tuberculosis.

2. All persons found to react to tuberculin on the

first test or subsequently should have x-ray film inspections of their chests in order to determine which of the reactors have macroscopic lesions in the lungs that might be due to tuberculosis. For this purpose the physicians of Meeker County decided to use the paper film because it has been found to be as satisfactory as celluloid film and also because of its lower cost.

3. All persons found to have lesions as manifested by shadows on the x-ray film to be completely examined to determine the etiology of their disease and those who prove to have clinical tuberculosis in a contagious form to be isolated at once. Those with disease in the pre-contagious stage to be treated either by the local physicians or sent to a sanatorium as indicated.

The Minnesota State Department of Health, through its Executive Secretary, A. J. Chesley, M.D., and its Director of Public Health Nursing, Miss Olivia Peterson, have aided and directed the County Public Health Nurse and School Nurse in this program. An intensive educational program was conducted throughout Meeker County by the Minnesota Public Health Association, the Meeker County Public Health Association, and numerous local organizations. The newspapers of the county have played an important role in bringing to the attention of the citizens everywhere the importance of controlling tuberculosis. It was arranged to have most of the tuberculin testing done in the offices of physicians and in schools when the physicians chose to go there for this work. Adequate x-ray equipment was found to be available in four offices and in the Litchfield Hospital. All x-ray work was scheduled for these five places. The local physicians are well qualified in x-ray interpretation, as well as all phases of the complete examination necessary to determine the etiology of disease which casts shadow on the x-ray film. Therefore, the medical profession of this county unit is self-sufficient from the standpoint of diagnosing tuberculosis in all of its phases of development. This also applies to the treatment and prevention of the disease.

The actual work began in May, 1941. The physicians arranged to send a special message to the head of each household in an entire township. This message contained information concerning the program and also an invitation to report to the physician or hospital of the family's choice for the tuberculin test. Following this the work has been extended from township to township.

On May 1, 1942, the Meeker County physicians reported that approximately 5,412 persons had been tested with tuberculin and 22 per cent reacted. Among the reactors, ten were found to have clinical pulmonary tuberculosis. In addition to actually finding the persons with chronic pulmonary tuberculosis a large amount of interest has been created among the citizens which we believe will result in numerous periodic examinations, after the demonstration is completed. While the physicians are doing all the work of the demonstration with no remuneration whatsoever, as only materials and costs are being provided, no one could expect that this would be continued beyond the period of the demonstration. However, we feel that the demand for examinations for tuberculosis will be so

increased as to result in good for all in future years.

The physicians practicing in Meeker County are establishing standards by actual practice and the work has proceeded to such a point that we believe medical societies of other counties will soon begin a similar tuberculosis control program. Indeed, the physicians in some counties have already made inquiry and expressed a strong desire to proceed at the earliest possible time.

Recognition or Accreditation of Counties

On September 25, 1941, the Committee discussed the advisability of setting up certain minimum standards in tuberculosis control which might serve as a basis for special recognition or accreditation of counties which qualified. Dr. A. J. Chesley, executive secretary of the Minnesota Department of Health, provided a list of the eighty-seven counties, together with the mortality rate from tuberculosis over the past five years. After studying these mortality rates, the Committee members were of the opinion that one standard for special recognition might be an average mortality rate of ten or less over the past five years. It was found that four counties, namely, Lincoln, Murray, Olmsted and Stevens, already had this low mortality rate. The Committee was of the opinion that incidence of tuberculous infection among seniors in high schools of the county might serve as a second standard for special recognition. At the September and October meetings these standards were discussed and it was decided that a county would be considered as qualifying for recognition if the annual average mortality rate over the past five years was ten or less per 100,000 and a recent testing of at least 80 per cent of all high school students in the senior classes revealed not more than 15 per cent infected.

A county outline map of the State of Minnesota was prepared on which the average mortality rate for the past five years is indicated by various degrees of shading. The lighter the county appears the lower the tuberculosis mortality rate (Fig. 1). There are several counties in Minnesota with the mortality rate between ten and fifteen per 100,000, which might soon qualify for accreditation if the seniors in their high schools meet the infection incidence requirement. In some counties the mortality rate is still high. This is especially true where there is a considerable Indian population with high mortality rates. For example, in one county it is said that about 3 per cent of the population is Indian and that this 3 per cent provides about 50 per cent of the entire tuberculosis mortality. Although splendid work is being done to control tuberculosis among the Indians, it is obvious that considerable time will be required to reduce the mortality rate and the infection incidence to the present standards. Therefore, it has been suggested that in such counties some special provision should be made whereby the mortality rate and infection incidence can be recorded separately for Caucasians and Indians or that special recognition be given for achievement in tuberculosis control among the Indians.

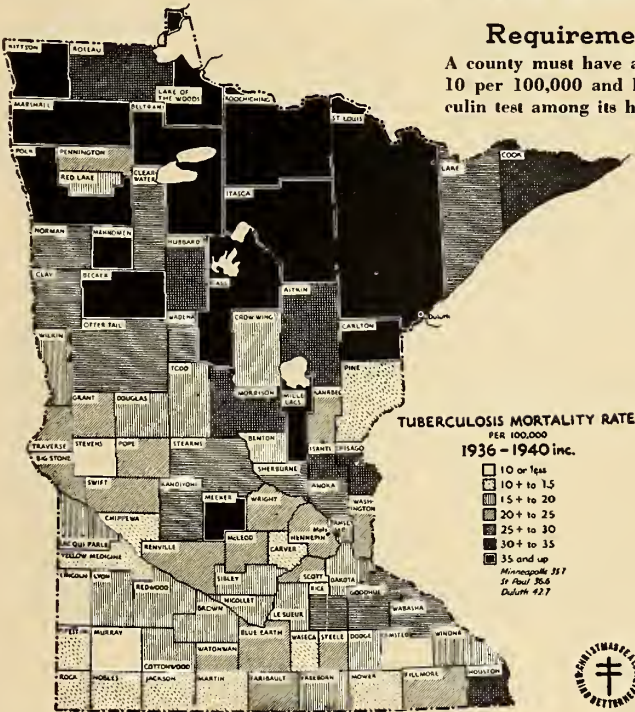

In St. Louis, Ramsey and Hennepin counties the mortality rate is still well above the minimum standard requirement for accreditation and because of the large

TUBERCULOSIS PROGRAM

population in these counties it is possible that somewhat lower standards may be necessary for a few years. The proposed plan of accrediting counties was submitted to the Council of the Minnesota State Medical As-

sociation and the Committee on Tuberculosis and the Department of Health prepare the certificate.” The subject was presented before the regular meeting of the Minnesota Department of Health on October 28,

Where Does Your County Stand?
STUDY THIS MAP!

Requirements for Accreditation
A county must have a tuberculosis death rate of less than 10 per 100,000 and less than 15% reactors to the tuberculin test among its high school seniors.

DEATH RATE OF 20 PLUS TO 25

Rank	County	Average Rate Per 100,000 1936-1940
31	Grant	20.5

Minnesota Tuberculosis Death Rate by County
1936-1940 Inclusive

DEATH RATE OF 10 OR LESS
*Accredited Counties

Rank	County	Average Rate Per 100,000 1936-1940
1	Lincoln	5.5*
2	Olmsted	8.7*
3	Stevens	9.2
4	Murray	9.4

DEATH RATE OF 10 PLUS TO 15

5	Carver	10.3
6	Martin	10.7
7	Pine	11.3
8	Chippewa	11.9
9	Jackson	12.0
10	Nobles	12.6
11	Rock	12.8
12	Pipestone	13.4
13	Mower	13.9
14	Yellow Medicine	14.2
15	Waseca	14.6

DEATH RATE OF 15 PLUS TO 20

Rank	County	Average Rate Per 100,000 1936-1940
16	Cottonwood	15.1
17	Lac Qui Parle	15.5
17	Wilkin	15.5
18	Dodge	15.7
19	Ramsey	16.4
20	Sibley	16.9
21	Brown	17.5
22	Benton	17.6
23	Douglas	17.9
23	Le Sueur	17.9
24	Nicollet	18.9
25	Dakota	19.1
26	Red Lake	19.2
27	Winona	19.3
28	Crow Wing	19.8
29	Lyon	19.9
29	Todd	19.9
29	Freeborn	19.9
30	Redwood	20.0

sociation on October 12, 1941, when the following action was taken:

“The matter of issuing a certificate or some means of recognition to the four counties in Minnesota eligible for accreditation was discussed. It was moved, seconded, and carried that the State Department of Health and the State Medical Association, subject to the approval of the Department of Health, issue a certificate

in 1941, and the plan was approved. This body voted to appoint a committee from its membership to work with the Tuberculosis Committee of the State Medical Association. The president, Dr. Erling Platou, appointed Drs. Ruth E. Boynton and A. G. Shulze to membership on this Committee. Members of the Tuberculosis Committee had already drawn up some proposed recognition certificate forms. These were presented to the

TUBERCULOSIS PROGRAM

Minnesota Department of Health Committee, who selected the one they considered most appropriate. This was then submitted to Dr. Chesley, to all members of the Council, and to members of the Committee on

county in the United States to be accredited with reference to tuberculosis control in man. Olmsted County was accredited on May 22, 1942, Murray County on August 28, 1942, and in October, 1942, Stevens County

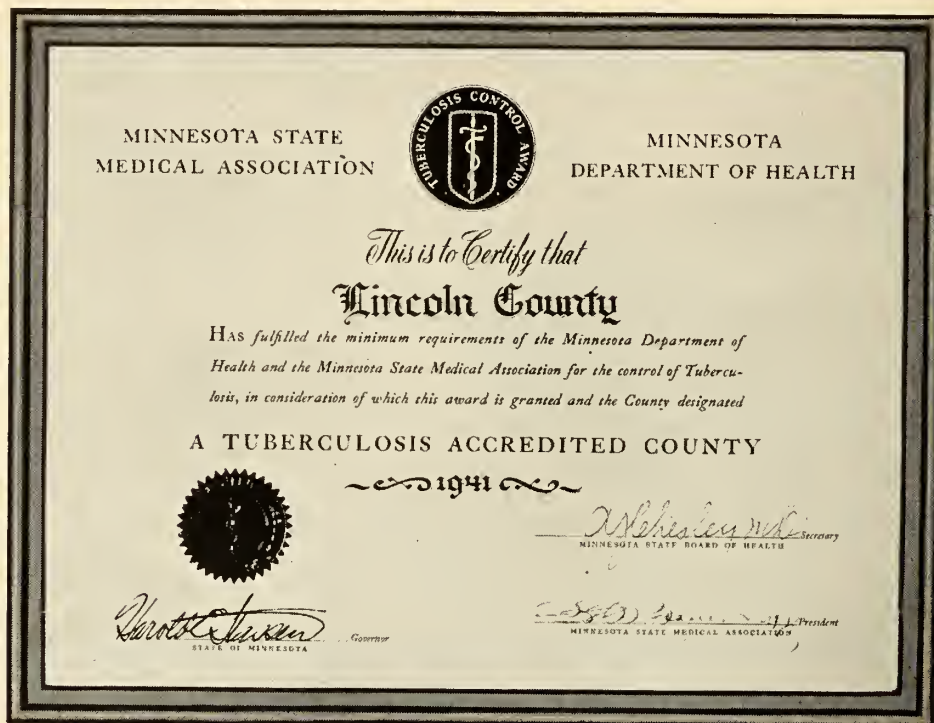

Fig. 2.

Tuberculosis of the State Medical Association for any suggested change.

Accreditation of Counties

Since Lincoln had the lowest mortality rate of any county in the state (5.5) for the past five years and since within approximately two weeks after special recognition was suggested the physicians of that county tested the high school senior students and found the incidence of infection to be only 7.4 per cent, the Committee decided to recommend to the Council and the Minnesota Department of Health that they jointly certify or accredit this county as the first one to attain the minimum standards. It was then decided that this event should be celebrated at Tyler, in Lincoln County, on December 11, 1941, when the certificate (Fig. 2) was presented. As far as we know this is the first

county in the United States to be accredited with reference to tuberculosis control in man. Olmsted County was accredited on May 22, 1942, Murray County on August 28, 1942, and in October, 1942, Stevens County

RELIEF FROM ASTHMA

"Beneficial results" and relief of asthmatic paroxysms in nearly three-fourths of a group of asthma patients were obtained by x-ray treatments, Dr. Ira I. Kaplan and Dr. Sidney Rubinfeld, of New York, reported.

The longer and more severe the illness, the more favorable was the response, the doctors stated. Often the symptoms got worse following treatment before they got better.

The patients were mostly men between thirty and fifty years who were allergic to various proteins but who were not helped by desensitization treatment. The x-ray treatment was given two to three times a week over the chest, occasionally over other parts of the body.—*Science News Letter*, September 26, 1942.

CLINICAL-PATHOLOGICAL CONFERENCE

MINNEAPOLIS GENERAL HOSPITAL

A. J. Hertzog, M.D., and S. V. Lofsness, M.D.
Pathologists

Presentation of a Case

DR. M. TENEN: This case is that of an eighty-three-year-old white female who was admitted to the surgical service on June 26, 1942. She had recently fallen and suffered a fracture of the neck of the left femur. Her previous history is most significant. At the age of sixteen years, a small growth about the size of a pea was noticed on the right side of her face in front of the ear. It caused no symptoms but slowly enlarged, reaching the size of a chicken egg at the age of forty years, when it was excised. The tumor has since been removed six times at various hospitals but always recurred. In 1923, the tumor was diagnosed in a Minneapolis hospital as adenocarcinoma. In 1933, following removal of the tumor at the University hospital, the diagnosis was squamous cell carcinoma. However, following a discussion between the surgeons and pathologists, the diagnosis was changed to mixed tumor of the parotid. In 1936, radon seeds were implanted. The tumor gradually grew larger and during the last four years infiltrated the whole right side of her face and extended 6 cm. below the lower border of the mandible. She became blind and deaf on the right side during the last two years of her life. The fracture of the neck of the femur was treated by spica. However, the tumor of her face prevented her from eating and her weight dropped to 80 pounds. She became weaker and expired on August 29, 1942.

DR. GRATZKE: Radiographs made on August 25, 1942, show a complete destruction of the right mandible and erosion into the basilar portion of the skull, maxilla, and orbit. The malar bone and zygomatic process are also destroyed. The areas of decreased density in the tumor suggest adipose tissue, while the areas of increased density resemble bone and fibrous tissue. Old radon seeds are seen in the upper portion of the tumor in the region of the parotid gland. The tumor is quite invasive and suggests a myxosarcoma.

DR. HERTZOG: This is an unusual history for a malignant tumor. The tumor was first noticed at the age of sixteen years and she died at the age of eighty-three years, a total duration of sixty-seven years. I would like to ask what was the immediate cause of death?

DR. TENEN: She died of starvation because the tumor prevented her from eating.

Autopsy Findings

DR. TENEN: Autopsy revealed an emaciated elderly female weighing only 80 pounds. The right lung weighed 840 grams and the left lung 320 grams. The right lung showed bronchopneumonia and the right pul-

monary artery was occluded by a large antemortem blood clot. The source of the pulmonary embolus was not found. The other anatomical findings of interest were limited to the face. There was a tumor that extended from the right orbital region to about 6 cm. below the inferior border of the right mandible. The right mandible was infiltrated and destroyed by the tumor. The tumor also infiltrated inward and involved the entire inner surface of the cheek and extended posteriorly to the pharynx. It also extended up behind the right eyeball, pushing the bulb forward with a resulting exophthalmus on that side. The tumor had infiltrated the floor of the middle cerebral fossa, pushing up the temporal lobe but not infiltrating the brain. The defect in the skull measured 3 cm. in diameter. Photographs of the specimen are shown.

DR. LOFSNESS: We have several slides from the tumor taken at autopsy. These at the periphery show evidence of rapid growth and are composed largely of solid masses of epithelium and small irregular glands. Other sections show a myxomatous stroma between the islands of epithelium. There are no areas of cartilage. The other slide is one of a bronchial lymph node. It was sectioned because it was thought that it might represent metastasis. However, it shows only chronic inflammation and a large amount of carbon pigment. Although she had this large tumor for sixty-seven years, the autopsy showed no evidence of any metastases.

DR. HERTZOG: I think the slides show the cause of the discrepancy in the earlier histological diagnoses. If a section was taken through the solid areas, it could be called an adenocarcinoma. It is only when the myxomatous stroma of the tumor is seen that we recognize that we are dealing with a mixed tumor. It is generally believed that the tumors of this type that show a preponderance of epithelium are more apt to recur. This is the usual history of a mixed tumor of the parotid; namely, frequent recurrences with a tendency to invade surrounding structures, but not to metastasize. True carcinomas occasionally occur in the salivary glands, but these are rare and characterized by rapid growth and metastases.

DR. TENEN: One of the most complete studies of mixed tumors of the salivary glands was that reported by McFarland (Surg., Gynec. and Obst., 63:457:1936) in a follow-up study of a large series of cases. In 301 cases, he found 278 occurring in the parotid, twenty-two in the submaxillary gland and one in the sublingual gland. The largest tumor found when left undisturbed weighed 26 pounds. Recurrences were noted as long as forty-seven years after removal. One case had seventeen recurrences in twenty-three years. McFarland came to the surprising conclusion that the smaller the tumor, the more likely it was to recur. Hence, he recommended waiting until the tumor approached the size of a lemon before it was removed. He called this letting the tumor become ripe.

HISTORY OF MEDICINE IN MINNESOTA

PIONEER PHYSICIANS OF MARTIN COUNTY PRIOR TO 1900

By ROSCOE C. HUNT, M.D.

Fairmont, Minnesota

THE early history of Martin County is similar to that of other western settlements. Homesteads along the Blue Earth River had been taken, and venturing from there a few hard settlers crossed the prairie westward and took permanent claims along the wooded banks of the lakes in Martin County. A settlement was made at the Center Chain Lakes, in the southern part of the county, then called Chanyaska. Another was on the lakes where Fairmont now lies. In 1857 Elisha Banks Hall established his home in the timber on the east bank of the beautiful lake which bears his name. William Budd soon afterward settled on the shore of the adjoining lake north which in turn bears his name.

Although the details of medical practice in Martin County prior to and through Civil War days are extremely vague and indefinite, there are records of certain physicians having lived here. It is known that some carried the title of "doctor" who had little or no medical education, but who, as adventurous spirits, gave what medical services they could to those who had no better care.

Although definite dates are hard to find, many things are known about the lives of these early physicians.¹ There were a few who are remembered mainly because of their bad habits, but most have left behind them records of great services rendered to the community under the most trying conditions. As one reads the meager accounts of their activities and hears by word of mouth of their characters, one is impressed greatly by the devotion, skill, honesty, and physical endurance of these pioneers. A man's ability must be measured by what he is able to do under the conditions in which he works. With this as a standard, who can say that these men were in any degree inferior to their confreres who practiced in settled communities where every facility for scientific practice existed?

Among the earliest settlers there came to Center Chain a Dr. Shafer,^{1,2} in 1858. He staked a claim on a strip of land between North and South Silver Lakes, just above the Iowa Line and adjoining Iowa Lake on the south. Here he had his homestead and built a log cabin which still is preserved (1942) on the original site. There is little known about him except that for several years he was the only physician west of the Blue Earth River and that he practiced for at least ten years. That he probably was not a skillful physician is indicated by the record that on one occasion when a number of persons had frozen their hands and feet in a blizzard it was necessary to call a physician from Blue Earth to perform the amputations. The last note available on Dr. Shafer is a paragraph in the *Martin County Sentinel* of March 19, 1875, in which it was stated that Dr. Shafer was seriously ill at his home in Center Chain.

Dr. McDuff¹ lived in Tenhassen, at least from 1862 to 1865. Both of these dates are of record, the latter being the year of his appointment as "country doctor to the poor" by the county commissioners.

Dr. Denton is shown by the records to have been appointed county physician in 1865. There seems to be no other record of him available.

Dr. Orville Paterson Chubb^{1,2,3,4,15} was the first practitioner of known medical ability to establish residence in the community. He was born in Wayne County, Michigan, in 1830. He was graduated from Wesleyan College at Leone, Michigan, near Ann Arbor, and subsequently was graduated from a medical school in Cincinnati, possibly Cincinnati University. Throughout the Civil War he served as a captain in the Medical Corps of the 5th Michigan Regiment.

In the spring of 1865, with General Cutcheon, Colonel Lonsberry and other officers of the Regiment, he came to Martin County to take up land under the Soldiers' Filing Law. After filing claims these men returned to their army service, which was soon to be terminated. In the fall of 1865 Dr. Chubb and Colonel Lonsberry returned to Martin County, driving a flock of sheep overland.

At various times during his stay in the county Dr. Chubb owned considerable property. He was a man of ability in many lines. As a surveyor he laid out the townsite of Fairmont, platted the first cemetery and also the first fair grounds, and located a great many claims for settlers. He constructed bridges across creeks and rivers in the county. At various places he examined clay and by Buffalo Lake, north of Fairmont, he found some that was suitable for making brick. Here he built a kiln, and the brick he made were used for several buildings. One of these structures, which still stands (1942) he built for his home, and in it he ran a hotel for several years. He stocked and managed the first drug store in Fairmont. He built one of the first sawmills in the county on the creek north of Wilmont Lake, and with another early settler, Alpha D. Cadwell, operated a grist mill where flour first was made in the county. The site of the mill was on Center Creek at the outlet of George Lake. Both mills ran by waterpower. For some time Dr. Chubb published a newspaper. He was a charter member of the Chain Lakes Masonic Lodge.

Dr. Chubb was a very gentle and quiet man. His experience in the Civil War, with its attendant suffering and death, sickened him of contact with illness and pain, and he did not intend to continue medical practice on his return to civil life. However, as there was no other physician in the community, he willingly and skillfully gave medical service to all who asked it, until Dr. David Winslow Hunt arrived, in 1871. He then discontinued practice and never resumed it.

In 1873 the community became too well settled to suit Dr. Chubb and his restlessness took him onto the frontiers of Kansas, Nebraska and other western states. Finally he reached California, where he lived many years. His death occurred in Michigan in 1894. The body was brought to Fairmont, where it rests in Lakeside Cemetery.

David Winslow Hunt^{1,3,7,13,17} was the first physician permanently to locate in Fairmont for the practice of medicine. He was born in 1845 in Mason, New Hampshire, and was the older of two sons, both physicians, of Dr. Nehemiah A. Hunt, a "circuit riding" physician of Blue Earth and Faribault Counties in the early sixties. He entered the Union Army in 1862 at the age of seventeen years and served until near the end of the war. He spent some time in a Confederate prison. During his service he received some slight wounds and in the spring of 1865, after long confinement in a hospital, he was discharged and returned to his home. Although after many months he regained his health, some disabilities, the result of his injuries, followed him throughout his life. After his return to active pursuits he resumed his education, taught school in Vernon Center in 1868 and 1869, and was graduated from the Medical School of the University of Michigan, at Ann Arbor, in 1871. This same year he established his residence in Fairmont, where he practiced thirteen years.

Dr. Hunt was a mild-mannered, likeable man of good medical ability. He did not affect the beard that most physicians wore in those days but had a long, thick mustache. It is probable that he performed the first surgical operations of any importance in the county. In the year 1874, he performed a "cutting" operation for the cure of hernia on a settler, John Rooney,⁸ who lived on a claim near St. James; the procedure was carried out in the patient's log cabin. There is a record of an amputation of both feet which was performed under comparable conditions, in a basement under a log cabin.

The *Martin County Sentinel*² in 1875 stated: "Dr. Hunt went to Saint Paul to attend a State Medical Society. He will be gone about a week and in the meantime people had better refrain from getting sick." He was the only physician in the community at that time. The *Sentinel* later stated that Dr. Hunt owned and operated a drug store.

In the issue of the *Sentinel*² for January 1, 1875, there appeared the following item:

"A runaway. Dr. Hunt's spirited team got the start of him last Sunday night while he was returning from visiting patients and indulged in a runaway which would have done credit to a much larger town than Fairmont. Our reporter was unable to follow the team in all its ramsidulations but we learned that the doctor was thrown from the buggy—the buggy broken in many pieces—one of the horses seriously injured and the buggy badly mutilated."

In 1882 Dr. Hunt found that he was unable to stand the rigors of the climate, turned his practice over to his brother, Dr. F. N. Hunt, and moved to California. He practiced in Anaheim, Redlands, and then for many years in Glendale. During these years he invested all of his income in various speculations: orange orchards, walnut groves, oil wells, and so forth, and he always lost. Some of the land he owned on Signal Hill, Long Beach, later made millionaires of a good many people.

Dr. Hunt died⁹ in 1922 at the Soldiers' Home in Sawtell.

Dr. Ammi Lander Bixby^{3,4,5,14,16} was born April 21, 1856, on the farm his father had taken as a homestead on the east shore of Iowa Lake a few miles south of the Minnesota line. He spent his boyhood there and attended country school. His early training as a physician was obtained by study with a physician at Estherville, Iowa, and soon afterward, about 1878, he started practice at Sherburn, or as he used to say, "hung out his shingle." He was the first physician in Sherburn, a small frontier town where money was scarce. In 1878, he married a girl from his home neighborhood to whom he always lovingly referred as "Mollie."

In 1879, Dr. Bixby moved to North Platte, Nebraska, where he practiced medicine for two years. After a short interval spent in newspaper work at Swan Lake, Iowa, he attended Rush Medical College; he did not finish the course, but left to return to the newspaper field. He worked in various newspaper offices and became a writer of human-interest stories, mostly in poetical style. For many years, from August 24, 1892, to December 24, 1934, the day of his death, he wrote the column "Driftwood" in the *Nebraska State Journal*.

His writings alternated between pathos and humor. He was much sought after as a speaker and gave many lectures throughout the West. His humor was chiefly droll, his talks and writings interspersed with stories and sketches of human interest.

For many years Dr. Bixby made an annual trip to Martin County in order to

attend the meeting of the historical society. At such meetings he was at his best. He used to refer to his "medical practice" in humorous terms. He said that the only apparent good net result of his practice at Sherburn was the establishment of a cemetery—that it had never been needed before because the people were so healthy; that at these meetings he saw many faces which would not have been present, he was sure, had he continued practice.

As a type of his humorous writings, there is quoted here a set of verses which he wrote after the football team of the University of Minnesota had beaten the team from the University of Nebraska:

We are feeling rather lame,
 Minnesota,
 And dejected since the game,
 Minnesota.
 'Twas a most unequal war,
 And our brave boys couldn't score
 Against lunkers six-foot-four,
 Minnesota.

When we strove to buck your line,
 Minnesota,
 When we gave the mystic sign,
 Minnesota,
 We could see you had us beat,
 For your men just spread their feet
 And it blocked the way complete,
 Minnesota.

Trot out men of decent size,
 Minnesota.
 Not such great, ungainly guys,
 Minnesota.
 Average mortals can't compete
 In the game and hope to beat
 Freaks who run to neck and feet,
 Minnesota.

The following poem is an example of the pathos which ran through many of his writings:

Only dreaming—nothing more—
 Back again so many years,
 Herding sheep—'twas when the war
 Filled the land with blood and tears.

Just a little boy again,
 Chasing sheep with brother John
 (Both of us are grown-up men
 And the years creep on and on).

But I dreamt with strange delight
 Of the scenes of long ago—
 There the woodland to our right,
 There the cherry grove below.

There the schoolhouse by the lane,
 Where I learned my A B C's;
 There the clearing where the grain
 Nodded to the summer breeze.

There the happy childhood home,
 There the sheepshed long and wide,
 There the creek that tossed its foam
 'Gainst the rocks on either side.

In my dream I saw it all,
 Lived my childhood hours in one,
 Heard the voice of Father call,
 "It is daylight—come, my son!"

O'er his grave the rain and snow
 Many years have fallen deep,
 And I only see him now—
 Only hear him in my sleep.

And the old home doesn't seem
 As it did in other years—
 Only when I sleep and dream,
 Dreams of joy to wake in tears.

When upon the bed of death
 I, at last, am called to lie,
 And my slowly ebbing breath
 Comes with labored sob and sigh,

I can in my pain rejoice
 That my last day's work is done
 If I hear my father's voice,
 "It is daylight—come, my son!"

Dr. Malcolm James Farrish^{2,13,19} was born in Rockwood, Ontario, of Scottish parents, in 1864. His elementary education was obtained at Rockwood Academy. Four years later he was graduated from Toronto University and in 1890 from Trinity Medical School. After completing a year of internship in the Minneapolis General Hospital he practiced one year in Minneapolis. After this he spent one year on the Range. In 1892 he took up residence in Sherburn.

Dr. Farrish having had what, for those days, was a most thorough medical education, was known as a brilliant physician and surgeon, and it was unusual for one of his ability to settle in a little village of a few hundred inhabitants. His practice soon extended into distant localities, however, and he had one of the the most extensive practices in the southern part of the state. The first major surgical operations in the section were done by him, in homes and later in the hospital which he built.

He held many civic offices and was a lifelong Democrat without compromise. As such he attended state conventions and was a delegate to one national convention. Dr. Farrish was much gifted along literary lines also and wrote and spoke with ability and originality. His ready wit and fund of stories made him the center of any group in which he happened to be.

In 1902, Dr. Robert Farrish, a younger brother, after an internship at the Mayo Clinic joined him and together they carried on a large practice.

In 1915, at the early age of fifty-one years, Dr. Malcolm James Farrish died at his home in Sherburn. His wife and two children, Charlotte and Dr. Robert, Jr., survive.

Henry Nickey Rice^{2,3,4,11,12,13,23} was born in Whitley County, Indiana, near Fort Wayne, September 2, 1842, the second son of Daniel B. Rice and Rose Ann Nickey Rice. At the age of eighteen years, in 1862, he joined Company B, 74th Indiana Regiment of Volunteer Infantry. He was wounded in the battle of Lovejoy Station, he marched with Sherman to the sea, and he spent a short time in Libby Prison. He served until 1865, when he returned to his home in Indiana. After his return he taught school one year. In 1866 he was married to Sarah Ellen Reed and in the same year brought his wife to East Chain, Martin County, where he joined his father in farming a homestead and in running a store.

In the *Martin County Sentinel* of October 16, 1874, appeared an item that read as follows: "Messrs. Henry Rice and Albert J. Franklin start for Keokuk, Iowa, in a short time where they propose attending a course of medical and scientific lectures. These gentlemen for the past two years have been studying with that renowned and successful practitioner, Dr. Winch of Blue Earth. That they will prove worthy and efficient disciples of Esculapius we have not the least doubt."

The next notice, in April, 1875, stated that Dr. Rice had opened an office in Fairmont. In 1885, Dr. Rice was graduated from Rush Medical College, Chicago.

Dr. Rice was a tall, slender man with a long, black beard. He always wore a long black coat and usually a tall black silk hat. Sitting upright in an open buckboard as his horses dashed through the main street, he was an impressive figure. He felt that his was an honorable profession and he expected the deference due him. Old settlers still remember him as a doctor with a real professional bearing. He carried on a successful practice and accumulated considerable property. He took an active interest in the Masonic Lodge. That he had civic spirit is evidenced by the fact that he was mayor of Fairmont for eight years; he served one term in the Minnesota Legislature, in 1877.

In 1897, he left Fairmont, removing with Mrs. Rice to Santa Ana, California, where he practiced medicine until 1907; thereafter they made their home in Hollywood. They lived to celebrate, in 1932, their sixty-sixth wedding anniversary.

sary. They had six children and twenty grandchildren. One daughter, Rose, wife of Mr. Edward J. Edwards who has been a druggist in Fairmont for more than sixty years, still lives in that city.

Dr. Rice died in Covina, California, in 1935.

Dr. Ferdinand N. Hunt^{2,3,4,13} was born in Sterling County, Illinois, in September, 1857, the son of Nehemiah A. Hunt, a pioneer physician of Blue Earth County. In 1863, the family came by oxtteams and covered wagons to Minnesota and settled on a claim at Lura Lake in the southern part of Blue Earth County. Ferdinand attended Mankato High School and completed two years at Carleton College. He then taught three years as principal of the Fairmont schools. Before he came to Fairmont several teachers had been thrown out by the boys and the contract he signed with the board provided that he must "stay in the school building" or he would get no salary. He stayed in. In 1880, he entered St. Louis Medical College. He was graduated in 1883 and settled in Fairmont, to take over the practice of his brother, David Winslow Hunt, who had broken down in health. Dr. F. N. Hunt practiced in Fairmont for ten years, during which time he went through the hardest of experiences on the prairies. He was a man very active and fortunately of remarkable health and strength. His trips extended fifty and sixty miles westward across the prairie.

Dr. Hunt was a great lover of horses and always had the best he could find. He brought in an imported Cleveland Bay, "Lord Newsom," but although this horse was of fine coach type his progeny did not have the stamina to hold up under hard use. A little Morgan horse, "Billy Harlow," produced wonderful horses that doctors all over the southern part of the state tried to get. They were invariably coal black, with a star in the forehead, very handsome and spirited, gentle, and tough. Dr. Hunt kept a good many of these horses. He had one team of Morgans that trotted to the pole in less than three minutes. He always said that his teams took a slow trot and never stopped, up or down hill, no matter what the distance, and that he never injured or winded a horse. Every horse in the stable, and there were always from five to eight, had to be curried night and morning. No mud was ever left on over night. After a drive in warm weather, the horse's head and the neck under the collar were always washed off. Horses in the winter were kept well blanketed day and night except when under the harness and were fed all the oats and hay they would eat. If there was a hobby that Dr. Hunt and most early physicians had, it was that of owning fine horses. With these faithful helpers, physicians spent many long hours, and to them they often trusted their lives. In storms and on dark nights it was the usual thing for the doctor to give the horses the rein, and they seldom failed to find their way across the prairies and to get home safely.

In 1893, Dr. Hunt sold his practice to W. J. Richardson and removed to Blue Earth where he spent twenty-one years. In 1914, with his son, Dr. Roscoe C. Hunt, he returned to Fairmont where he established the Fairmont Hospital. He confined his practice largely to surgery and was active until a year before his death. In February, 1934, he fell on the ice, receiving a head injury from which he died after two weeks.

In 1882, Dr. Hunt was married to Ida Lenore Cadwell, daughter of Alpha D. Cadwell, pioneer merchant of Fairmont. There were two sons, Roscoe C., of Fairmont, and Rollo F., a lawyer in Duluth. Dr. Hunt never was in politics, but he did at times serve on civic boards and for a good many years on the State Board of Health. He practiced more than fifty years in Martin and Faribault Counties. His widow survives (1942).

Dr. George Rising Harnden^{1,3,20,24,25} was born near Barrington, Illinois, April 14, 1839, the oldest son of Joshua S. Harnden, an old-time whaler. He attended the country school in the community. In 1873, George and his two brothers, Wells and Charles, drove to Minnesota in covered wagons. The three brothers homesteaded claims east of Sherburn, Martin County, with which old timers are familiar.

While the family was still in Illinois, George Harnden's wife was in poor health much of the time, so that the family physician prepared a case of simple remedies for Mr. Harnden to use for her and gave him a medical book to study. This was the start of his medical study and after settling in Minnesota he gave medical care to neighbors and others needing it. There were medical practice laws, however, which were interfering with the continuance of this practice, and he decided to qualify himself for a medical license. His wife died suddenly in 1881 from blood poisoning caused by the bite of her driving horse. Mr. Harnden in that year returned to Illinois and studied at Wheaton College and at the Homeopathic Medical School of Chicago, receiving a diploma from the latter school in 1884.

After his graduation he returned to Sherburn, Minnesota, and commenced his medical practice, which continued until 1902 when he moved to Oklahoma. He was not satisfied there and returned to Sherburn after a year, to resume practice to a greater or less extent until 1913. In that year he went to Stillwater, Oklahoma, where he died May 25, 1920, from cerebral hemorrhage.

At the time of the Great Chicago Fire, in 1870, George Harnden was driving a milk wagon in the city. He was one of the first to re-enter the city in the morning after the fire and he recalled that the bricks were so hot that the horse walked gingerly. In his frontier practice Dr. Harnden went through the usual experiences in storms on the prairie. He was known as a very charitable man who did much for people, rich or poor. He organized and faithfully supported the Congregational Church in Sherburn, and for years was a prominent and useful citizen of the community.

His first marriage was in 1861 to Frances E. Meachem. To them were born a son, Florus David, and a daughter, Elizabeth Frances. As stated previously, his wife died in 1881.

After returning to practice subsequent to his graduation from medical school, Dr. Harnden was married, September 22, 1885, to Alice C. Reynolds. To them were born three children, Myra A., Merrill DeWitt, and Millard George.

Dr. George R. Harnden^{13,20} was the son of early residents of Martin County. His license to practice was issued by the State Medical Examining Board on December 3, 1883, and it was filed by the Martin County Clerk of Court on the next day, December 4, 1883. Dr. Harnden commenced practice at once in the village of Sherburn, which had several hundred inhabitants, and continued there until about 1900. He later entered practice in Oklahoma, where he died.

(To be continued in November issue)

President's Letter

MEDICAL EDUCATION IN WARTIME

What are the obligations and what should be the attitude of the members of the State Medical Association with respect to medical education in time of war? The following comments on this question are offered for your consideration.

I think it can safely be said that military service of bona fide premedical and medical students who are maintaining good grades will be deferred until after their internship. But the difficulties of supplying adequate instruction for our medical students are very real. Members of faculties who are less than forty-five years of age and have been declared essential are under the constant pressure of embarrassing situations. Their colleagues and members of their communities not infrequently wonder why they have not received commissions. They should have some recognition in the war work—some emblem which conspicuously indicates that they have been declared essential at home—or they should be commissioned and assigned to the faculty as necessary men. There is not a sufficient number of older men who are qualified to teach. A certain proportion of younger men is necessary to every faculty.

Research necessarily will be curtailed but we should do our best to encourage those who are incapacitated for military service and those who are more than forty-five years of age to continue their productive work. War is destructive of many elements of our culture, and we must maintain, if possible, a foundation for future reconstruction.

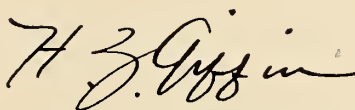

Graduate education will suffer. Fewer men will be able to accept fellowships and study as specialists. This is a situation which will affect the future but the demands of the military services make it impossible to declare many graduate students essential.

The meetings of most national medical societies will be canceled because of travel, the time required for attendance, and the extra load on every individual physician. In some instances reports of papers probably will be supplied in abstract to the members by mail, and the officers only will meet to conduct business. An entirely different situation exists, however, with respect to state, district and county societies. Even with gasoline rationing most physicians will have a supply liberal enough to attend meetings near home, and one-day meetings will require very little time. Consequently, it would seem wise to encourage monthly meetings of component and county societies. There should be no difficulty with programs for these meetings if the president of the local society will conduct a round-table type of discussion based on the packet of the month which is distributed by the State Medical Association. A digest of the packet can first be presented and the meeting opened for general discussion. These packets will be on timely subjects of interest to everyone. Set programs can be arranged for regional societies like the Southern Minnesota and Northern Minnesota Medical Associations, and for the State meeting.

Every encouragement should be given to those conducting courses at the Center for Continuation Study. By attendance whenever possible, a physician can combine a short vacation with profitable instruction. The work of the Center for Continuation Study is an outstanding achievement of national importance. We should in every way show our appreciation of the accomplishments of Dr. W. A. O'Brien and his colleagues.

In addition, I would like to see the staff of every hospital in the state arrange an occasional clinic day for physicians in nearby communities. Very interesting discussions probably would develop and the quality of the work of the staff itself would be improved.

In such simple yet effective ways can postgraduate education and a high standard of medical care be maintained during this tragic period of our history.

TUBERCULOSIS AMONG MEXICANS

The Tuberculosis Abstract for October, issued
by the National Tuberculosis Association, deals
with the incidence of tuberculosis among the
Mexicans in our country. The incidence of tu-
berculosis in white people in our country in 1940
was 36 per 100,000 population. Among the
Negro race the incidence is about three and a
half times as great. The incidence in the Mexi-
can race in this country is said to lie somewhere
between the two and it is brought out that it is
higher among Mexicans who have come north
than among those who have remained in the
southern states.

Minnesota has a considerable Mexican popula-

tion. Minnesota physicians have known for years
that the incidence of tuberculosis in Mexicans in
this state is high, so much so that an infant
Mexican admitted to a municipal hospital in the
Twin Cities with symptoms of meningitis is most
likely to be diagnosed as miliary tuberculosis. It
would be interesting and valuable to make a
survey of the incidence of tuberculosis among the
Mexicans in this state and to do something about
the active cases found.

CORONAR HEART CASES

DEATHS from heart diseases are increasing
at an appalling rate. As an instance, view
the statistics of the Hennepin County Coroner's
office. This is true not merely in Hennepin
County, but all over the country. Inasmuch as
the coroner's office deals only with sudden, unex-
pected deaths where the victim has not been
under a doctor's care, this means that many times
the number seen by the coroner die from heart
disease. With only eight months of 1942 gone
there have already been about 230 deaths among
those investigated by the coroner's office in Min-
neapolis, due to this cause. Last year there were
319 coroner heart cases, or 36 per cent of the
cases investigated. In 1925 there were 165 cases,
or 21 per cent.

The number of heart deaths seems to reflect
the tensify of the times. In 1929 while prosperity
reigned there were 145 heart deaths or 20 per
cent. After the crash the 1930 records show
190 deaths; and the depression of 1933 sent the
figure up to 226. Since then it has increased
steadily.

Coronary sclerosis is the dominant type of
heart disease causing sudden death. To some ex-
tent it is an occupational ailment. Businessmen
and others who go in for heavy thinking and
worrying are the most frequent victims. Con-
versely, transients and others who do not work
because they prefer to be idle, are seldom coroner
heart casualties. Most victims do not die in
the midst of activity, indicating that it is not the
immediate situation which causes death, but the
background of emotional strain.

EDITORIAL

The following deaths from heart disease in Hennepin County are recorded by the coroner's office of Hennepin County for the period of 1925 to 1942:

Year	Heart Deaths	Total Cases for Year	Per Cent to Total
1925	165	770	21
1926	163	723	23
1927	184	690	27
1928	177	731	24
1929	145	773	20
1930	190	786	24
1931	189	813	23
1932	198	777	25
1933	226	824	27
1934	236	803	29
1935	223	811	28
1936	266	922	29
1937	263	790	33
1938	263	797	33
1939	290	824	35
1940	303	856	35
1941	319	886	36
1942	230	545	42
(incl. Aug.)	(approx.)		

G. W. Callerstrom, M.D.
Deputy Coroner, Hennepin County.

MEDICAL SOCIETY DUES

By next year approximately one-third of the active members of the Minnesota State Medical Association and its component county and district societies will be in military service. The question of whether to meet the reduction in income by curtailing the activities of the association, by making deep inroads into the reserve fund, or by making an assessment was thoroughly discussed by the delegates at the Duluth meeting last June. The decision was the unanimous approval of a \$5.00 assessment.

The component county and district societies are faced with the same reduction in income. Members in the service have rightly had their dues suspended for the duration, or refunded, or both.

In the case of most county societies the dues

are determined according to the cost of the society activities. Where the overhead is at an irreducible minimum, the society faces the alternative of going in the red and drawing on reserves (if any) or leveling an assessment.

County and state assessments of this sort amount to sharing the dues of members in service. That is the least we stay-at-homes can do for our confreres in service, even if our practices may not show some increase because of the thinned ranks at home.

It is well for state associations and county societies to keep the home fires burning and not to reduce essential activities nor to run behind financially with the intention of making up deficits when the boys come home.

QUININE AND QUINIDINE

Among the many adjustments we have to make as a result of the war is that mild one in connection with quinine and quinidine. The regulation scarcely deserves mention except in the interest of harmony between the pharmaceutical and medical professions.

The Health Supplies Branch of the War Production Board restricted the sale of quinine and quinidine some time ago for use in the treatment of malaria and heart disease respectively on account of its limited source of supply and the great demand for quinine by the armed forces, exempting prior to June 19, 1942, small stocks already in the hands of the druggists. Since June 19 all quinine and quinidine is so restricted.

Compounds of quinine already prepared by April 4, 1942, are permitted to be sold but we understand that such stocks are about depleted. The only exception to the prohibition of manufacturing compounds in the future is in the case of quinine and urea hydrochloride for hypodermic use or in quinine hydrochloride and urethane.

When a druggist buys quinine or quinidine he must certify that the quinine will be used only for malaria or the quinidine for heart disease. Obviously the only way he can carry out his part of the agreement when he receives a prescription for either of the drugs is the indication on the prescription by the physician of the purpose for which it is prescribed. Some physicians may argue that the statement of the indication on the prescription might be construed as a betrayal of professional confidence. In the interest of co-

operation with the druggists who are affected by this necessary restriction this point can be overlooked by physicians.

The practical result of this limitation of the use of quinine and its derivatives is the elimination of the old tonic, Elixir Iron Quinine and Strychnine and certain coryza tablets. The resultant suffering will not be great. The counter sale of quinine for its questionable abortive activity should also be eliminated. Some physicians may be inconvenienced from an increased demand for prescriptions which would have to be falsely certified for this use.

Physicians are urged to cooperate with the pharmacists in carrying out the regulation in regard to these two drugs in the common interest of the successful prosecution of the war.

COMMUNITY AND WAR CHESTS

This month, Minneapolis and Saint Paul, along with many other American cities, put on their yearly Community Chest campaigns. Although America has by no means a monopoly among nations on charity, the Community Chest is quite a testimony to the Christian civilization of our country. Individual charity to a less fortunate neighbor has been in existence since the time of Adam and has the virtue of the giver along with the gift. It would be too bad if Community Chest giving were to be substituted for this individual kind of charity. On the other hand Community Chest giving has the advantage in that joint action can often accomplish results unattainable by individual effort.

Just as organization of charity giving by means of a chest prevents neglect of certain agencies and undue favoritism to others, it affords an economy in the effort of collection and enables the contributor to aid many worth-while activities by one contribution. The existence of a Community Chest greatly facilitates the budgeting of contributions.

During the past year or two numerous additional agencies have been making requests for contributions to relieve war sufferers. How much one should give to British, Chinese, Greek, Polish, Dutch or Russian relief has been a question difficult for many to answer. So in many American cities, Minneapolis and Saint Paul included, a War Chest has been added to the Community Chest. Quotas for each relief fund have been determined for each state and the larger

cities. This ups the goal for the combined Community Fund and War Chest in Minneapolis from \$1,367,195 to \$2,303,564 and in Saint Paul from \$730,000 to \$1,100,000, a very substantial increase.

In spite of mounting taxes and lease-lend appropriations the heart of America goes out to those less fortunate in our own land and especially to those so much more unfortunate in foreign lands. Community Chest allocations to foreign relief agencies comprise only a portion of America's total contributions. The sum total of gifts from individuals doubtless surpasses chest contributions.

The evidence of human compassion portrayed by Community Chests is reassuring in a world where there is so much evidence of hate and barbarism.

WAR DEPARTMENT

Services of Supply

Office of the Surgeon General Washington

August 22, 1942

The Surgeon General of the Army published detailed information concerning policies governing the initial appointment of physicians as medical officers on April 23, 1942. Necessary changes are given wide publicity, at his request, in order that the individual applicants, and all concerned in the procurement of medical officers, may know the status of such appointments.

The current military program provides for a definite number of position vacancies in the different grades. The number of such positions must necessarily determine the promotion of officers already on duty, and, in addition, the appointment of new officers from civilian life. Such appointments are limited to qualified physicians required to fill the position vacancies for which no equally well-qualified medical officers are available. Such positions calling for an increase in grade should be filled by promotion of those already in the service, in so far as possible, and not by new appointments.

If this policy is followed, it would definitely penalize a large number of well-qualified Lieutenants and Captains already on duty by blocking their promotions which have been earned by hard work. In view of these facts, it has been deemed necessary to raise the standards of training and experience for appointment in grades above that of First Lieutenant.

With this in view, The General has announced the following policy which will govern action to be taken on all applications after September 15, 1942:

All appointments will be recommended in the grade of First Lieutenant with the following exceptions:

Captain.

1. Eligible applicants between the ages of 37 and 45 will be considered for appointment in the grade of Captain by reason of their age and general unclassified medical training and experience.

2. Below the age of 37 and ABOVE the age of 32, CONSIDERATION for appointment in the grade of Captain will be given to applicants who meet all of the following minimum requirements:

- a. Graduation from an approved medical school.
- b. Internship of not less than one year, preferably of the rotating type.
- c. Special training consisting of 3 years' residency in a recognized specialty.
- d. An additional period of not less than 2 years of study and/or practice limited to the specialty.

3. Eligible applicants who previously held commissions in the grade of Captain in the Medical Corps, Regular Army, National Guard of the United States, or Officers Reserve Corps *may be considered* for appointment in that grade provided they have not passed the age of 45 years.

Major.

1. Eligible applicants between the ages of 37 and 55 MAY BE CONSIDERED for appointment under the following conditions:

- a. Graduation from an approved school.
- b. Internship of not less than one year, preferably of the rotating type.
- c. Special training consisting of 3 years' residency in a recognized specialty.
- d. An additional period of not less than 7 years of study and/or practice limited to the specialty.
- e. The existence of appropriate position vacancies.
- f. Additional training of a special nature of value to the military service, in lieu of the above.

2. Applicants previously commissioned as Majors in the Medical Corps (Regular Army, National Guard of the United States, or Officers Reserve Corps) whose training and experience qualify them for appropriate assignments may be CONSIDERED for appointment in the grade of Major provided they have not passed the age of 55.

Lieutenant Colonel and Colonel.

In view of the small number of assignment vacancies for individuals of such grade, and the large number of Reserve Officers of these grades who are being called to duty, such appointments will be limited. Whenever possible, promotion of qualified officers on duty will be utilized to fill the position vacancies.

Much misunderstanding has arisen concerning recognition by Specialty Boards and membership in specialty groups. It will be noted that mention is not made of these in the preceding paragraphs. This is due to the variation in requirements of the different Boards and organizations. Membership and recognition are definite factors in determining the professional background of the individual, but are NOT the deciding factors, as so many physicians have been led to believe.

The action of the Grading Board, established by the

Surgeon General in his office, is final in tendering initial appointments. Proper consideration must be given such factors as age, position vacancies, the functions of command, and original assignments. All questionable initial grades are decided by this Board. Due to the lack of time, no reconsideration can be given.

There are in the age group 24-45 more than a sufficient number of eligible, qualified physicians to meet the Medical Department requirements. It is upon this age group that the Congress has imposed a definite obligation of military service through the medium of the Selective Service Act. The physicians in this group are ones needed now for active duty. The requirements are immediate and imperative. Applicants beyond 45 years may be considered for appointment only if they possess special qualifications for assignment to positions appropriate to the grade of *Major* or above.

CLINICAL-PATHOLOGICAL CONFERENCE

(Continued from Page 807)

INTERN: What is the logic of waiting until the tumor is the size of a lemon before attempting to remove it?

DR. HERTZOG: McFarland's idea was that the tumor became better encapsulated and was easier to remove with less chance of recurrence. However, I do not believe the majority of surgeons think this is true. Wood reported 55 per cent cured by the first operation and 30 per cent more by subsequent operations. I would like to ask Dr. Gratzek to say something about the effects of irradiation on these tumors.

DR. GRATZEK: In treating these cases pre-operatively, and in those patients who refuse operation, it is necessary to do it very vigorously. Parotid tumors have to be treated to the point of skin tolerance, as they will not respond to radon implants. I have seen regressions after deep x-ray therapy given to the point of skin tolerance.

DR. PEPPARD: Naturally, I have not had considerable experience with these tumors but have made the diagnosis on several occasions. There are several points that I would like to bring up aside from those pertinent to the tumor. It is rather striking in hearing the history of this case that nothing whatever was said about anything except the fracture and the tumor. I have seen it happen so often that an old patient with an obvious lesion like this tumor lies around for a long time and finally expires. After we learn of the autopsy findings, we feel sorry that we did not have a note regarding some particular physical finding. These elderly patients are storehouses of pathological information and clinically, by neglecting them, we pass up an opportunity to sharpen our wits and increase our clinical skill. The implication was given that this patient died of starvation because her weight dropped to 80 pounds. However, at autopsy one lung weighed 800 grams and showed considerable pneumonia, and a pulmonary embolus was found. I think the correct diagnosis of pulmonary embolism varies from 33 to 75 per cent. We should try to improve our batting average. However, we are not going to hit 100 per cent on the diagnosis because there is frequently no clue that a patient has had pulmonary embolism.

Anatomical Diagnosis: (1) Mixed tumor of parotid; (2) Inanition; (3) Bronchopneumonia; (4) Pulmonary embolism.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics

of the

Minnesota State Medical Association

George Earl, M.D., Chairman

BILL FOR GOVERNMENT HOSPITALIZATION INTRODUCED

The long-awaited bill to amend the Social Security Act to include hospitalization has just been introduced into Congress by Congressman Eliot of Massachusetts according to word received from Washington. The bill has been referred to the House Ways and Means Committee.

Inclusion of hospitalization among already established Social Security benefits may appear to many people as a logical step forward in the Social Security program for Americans.

To physicians and hospital executives, especially, but also to all who fear extension of government paternalism into private fields and individual rights, the new bill will call for a great deal of careful consideration before it is adopted.

Medicine Involved

Not only the future of the flourishing system of voluntary hospital insurance is threatened by this measure, but also the great system of private hospitals. Obviously, the private practice of medicine which is intimately bound up in the hospital system is also deeply involved in the matter.

Many pertinent questions should be asked and answered to the satisfaction of the average citizen and of medical and hospital men as well as the politicians and reformers, before the bill is allowed to pass.

Presumably it provides for hospitalization at a fixed per diem rate for a fixed period in exchange for the usual additional Social Security payment by employe, employer and government. Would it result in more and better service than the hospital insurance plan?

What About Philanthropy?

Would it result in elimination of private philanthropy, in the substitution of government support and the inevitable lowering of hospital standards?

South Not Aided

Would it improve the situation in the South which is the only district where hospitalization is a real problem—and where those who might benefit most are unemployed and therefore not eligible to Social Security benefits?

Should the question of government hospitalization be considered at this time and wouldn't it be better for the American people and American hospitals to continue with the present voluntary approach at least until the war is won and various experiments in administrative techniques in voluntary insurance can be judged? These questions must be considered.

Pressure Due

There will be pressure brought to bear in the name of civilian health in wartime to pass this measure. Every effort should be made for a full and free hearing before recommendations are made for its passage.

FOR CO-OPERATION NOW

Letters from physicians already in the service with the Armed Forces frequently convey not only a sense of intense satisfaction because they are doing an essential job, but also a clear realization of the importance to the future of medicine of complete coöperation now with the Procurement and Assignment Service in providing physicians for active duty with the military forces.

The following paragraphs are quoted from a letter written by Lieutenant L. V. Berghs of Owatonna who is training for foreign service in one of the camps in the Southwest.

"Great Conditioner"

"Life in the desert is a great conditioner to say the least. I'm sitting in my tent with but a pair of shorts on and with the temperature about 120 degrees. A nice hot, drying breeze keeps the per-

piration at a minimum. We are being conditioned for desert warfare so that probably means North Africa for me as soon as our unit gets assembled, organized, equipped and trained. This probably will be in two or three months.

"We have a grand bunch of fellows and the powers in Washington did a good job in assembling our unit on paper. We have the correct proportion of surgeons, internists, orthopedists, eye, ear, nose and throat men and GU men. They are a likable group, young and middle-aged, quite gay and 'devil may care.' They have all come out of lucrative practices and fine homes and families. Now that they have burned all their bridges behind them, their attitude is, 'let come what may.' It's a darn good attitude for morale. We're all set to go as far as mental attitude is concerned.

Medical Officers Needed

"The Army is still in desperate need of medical officers. I sincerely believe it is one of the bottlenecks in our war effort. We are not sending troops abroad until they have a full complement of medical officers.

"Now, then, it's up to the medical profession to furnish the officers. The American Medical Association promised to see that the Army gets all the doctors it needs. You will recall that McNutt agreed to give the AMA a chance to do it but also promised, in the event that we fell down on the job, the Government would step in and take things into its own hands. That certainly would be a very deep wedge driven into our profession toward government control which, in plain words, means socialized medicine.

Political Stick

"One may say we are going to get socialized medicine anyway so what's the use of bothering about it. To this, the medical men in the Army say NO emphatically. If the profession behaves correctly now in furnishing men to the Armed Forces without government intervention, then we can dictate what we want after this war is over. There is no doubt but what the Army is going to wield a tremendous political stick after this thing is over and Army medical officers will undoubtedly wield a big stick too, not only in the AMA but also through the Army itself in national policies."

A recent poll of county societies has shown

that Minnesota physicians are responding, but more are needed to complete the state's quota of 918 by January 1, 1943.

NEW COMMITTEE TO STUDY MEDICAL CARE IN MINNESOTA

Certain sections within the Minnesota State Conference of Social Work have brought up the question at intervals for several years of the adequacy of medical care and public health in Minnesota.

A resolution was accordingly passed a year ago at one of the sectional meetings of the conference asking for an immediate study of the medical and public health situation in Minnesota, looking toward the possibility of new provisions for medical service.

The resolution was not adopted by the conference as a whole owing largely to an active effort by representatives of other organizations more directly concerned with medical services than the social welfare group.

These others, including chiefly physicians and hospital association members, had no objection to a study of the medical situation in Minnesota. They did, however, object to such a study carried on by laymen who are presumably unaware either of the problems or possibilities involved.

Representative Committee

Accordingly a substitute action was proposed and accepted by the Conference at its spring meeting providing for a representative committee to study the problem. This committee was to be composed of three representatives from the Minnesota State Medical Association and three each from the Minnesota State Dental Association, the Minnesota Hospital Association and the Conference of Social Work. Dr. George Earl of St. Paul, chairman of the Committee on Medical Economics, Dr. A. W. Adson of Rochester, chairman of the Committee on Sickness Insurance, and Dr. W. A. Coventry of Duluth, chairman of the Committee on Low Income and Indigent Problems were appointed as representatives of the medical association.

Problem Involved

Discussions at the first meeting of the general committee called in September developed nothing definite in the way of a program or immediate plan of action but did impress upon all partici-

pants the tremendous scope and infinite perplexities which their undertaking might involve.

To begin with, there was the fundamental question: Is there actually a problem in Minnesota and if so, where does it specifically lie? To answer that question fully could well involve studies costing thousands of dollars—and the committee has no funds.

Assuming that a question could be solved, moreover, what could such a committee do and where could it start? There is, of course, much pertinent information based upon isolated studies and reliable opinion in the possession of all of the organizations represented. There are even a few isolated studies of an exhaustive nature, such as the study made last year by the United States Public Health Service in Freeborn county. But none of this material has been gathered into comprehensive surveys of the sort that might appeal to professional statisticians..

Objective Uncertain

Other questions pressed upon the committee at this meeting: Would it limit its investigations to the provisions for indigent and marginal income groups? Would it concern itself with the middle-income group whose troubles so much interest the social theorists?

Would it delve into the possibilities of prepaid medical plans or would it push better health education of all classes to take full advantage of existing facilities which are admittedly extensive in Minnesota?

Would it aim at wartime health problems exclusively or would it concern itself with long-range plans for the peace to come?

All of these questions would have to be considered before any effective program could be undertaken.

Education Fundamental

To physicians who have made studies of all these things in their own committees, the basic need is generally regarded as education—education as to facilities and education in hygiene and preventive medicine. Such education obviously must go beyond the information now carried on by means of platform, radio and newspaper programs. It must extend to the secondary schools as well as the colleges in which a smattering of latin verbs and verse forms is still esteemed more highly than a working knowledge of body mechanics and needs.

Education is a fundamental problem which a group of this kind must take into account if its work is to bear fruit.

Will Be Clearing House

In any case, the value of a representative committee of trained professional people is not to be discounted even though its efforts do not result in sweeping overnight reforms in Minnesota. It will undoubtedly prove to be a clearing house for an exchange of ideas which will have a value of its own in the more intelligent and practical handling of the work of each of the organizations represented.

Certainly the physicians will welcome a chance to acquire first-hand the opinion and the information of other welfare bodies in an informal discussion group of this character.

Should Be Concerned with Peace

It is obvious, however, that the medical men, at least, are too busy and hard-pressed by wartime demands to consider any fundamental changes in provisions for medical service in these times, even if such changes are considered desirable by other members of the committee. The studies and conclusions of the committee are therefore far more likely to be of practical significance if they are concerned with health problems of peace.

FOR SERVICE ON THE HOME FRONT

The time is coming soon when the State Committee on Procurement and Assignment may be obliged to direct the distribution of physicians on the home front, so that no community in Minnesota will be without medical service.

Any physician who can be spared now to take over the practice of a man in service is urged to write immediately to the Committee at the State Office, 493 Lowry Medical Arts Building, Saint Paul.

SOURCE OF TUBERCULOSIS INFECTION

The source of the great bulk of infections with tuberculosis is a human carrier with a pulmonary cavity. While the home is probably the place of most childhood and some adult contacts, many primary infections and more reinfections must occur in the place of work. Nurses, physicians and attendants on the sick encounter a real occupational hazard from infection itself and this hazard should be accepted as incidental to the professional life while hospital management should assume the obligation of minimizing opportunities for mass infection.—Saranac Lake Symposium on Tuberculosis in Industry, Saranac Lake, June, 1941.

OCCUPATIONAL HEALTH HAZARDS

Keeping the employe healthy is the primary purpose of industrial health supervision. There are many factors involved in attaining this end, not the least of which is the prevention of an accident or illness before it occurs. An effective industrial health program requires close coördination of medical and engineering methods. A physician, therefore, to fill his part in the program and to think properly in terms of prevention must have at least a basic understanding of the general methods of engineering control, and obviously he must have some knowledge of the processes and material used in his plant together with an understanding of health hazards attendant with their use.

The control of an industrial health hazard begins with an evaluation of the degree of danger involved. Many times the danger will be self-evident whereas at other times it may be necessary to evaluate a potential hazard by engineering studies. There is a tendency on the part of the management to forget about occupational disease when medical personnel is available, and thus engineering problems related to health inadvertently fall into the hands of the industrial physician. A physician with some knowledge and appreciation of the methods of control can bring to the attention of the engineering and safety personnel a health hazard which could be subjected to some means of control. The coördination of the medical and engineering services of a plant will do much toward furthering a program for the control of occupational diseases.

Many Methods

There are many ways of controlling hazardous exposures to toxic materials, the most common of which is ventilation. Each method of control, alone or in conjunction with other methods, however, has its definite application in the field of industrial health. There are five general methods for the control of these hazards.

1. The most successful control measure is the *substitution* of a harmless material for one which is toxic, thus eliminating the source of the hazard. The number of opportunities for such substitutions are naturally limited. Changes in the method of processing will likewise often eliminate the source of the hazard.

2. Several methods of control commonly used prevent the dispersion of toxic materials into the atmosphere. *Segregation* of an operation prevents the exposure of workers to a toxic material not produced by their own work. These operations may be carried out in an isolated part of a plant or by a small group of men at a time when most of the workers are gone. Usually these workers need some personal protective device. *Enclosure* of the offensive operation may itself prevent the escape of hazardous material into the atmosphere. The use of *wet methods* has found extensive application in reducing atmospheric dust concentrations associated with certain operations. *Local exhaust ventilation* is very commonly used to prevent the dispersion of toxic materials into the atmosphere when the source of those materials is produced at a fixed location. Such systems must be very carefully designed to give maximum effectiveness.

3. A third general method of control consists of the *dilution* of the contaminated air with fresh air until the concentration of the toxic material no longer constitutes a hazard to the health of the workers. Either positive ventilation, fresh air forced into the room, or negative ventilation, contaminated air exhausted from the room and fresh air drawn in through windows and doors, or a combination of both may be used. This method is frequently used in conjunction with other methods of control.

Personal Protections

4. *Personal protective devices* should be considered only as a second line of defense for continuous exposures. Whenever possible the hazard should be eliminated. The use of respirators, gas masks, oxygen breathing apparatus, and similar respiratory protective devices is especially applicable for emergency use as a protection against infrequent toxic exposures. The use of protective ointments, gloves and suitable clothing, although not strictly engineering control measures for exposures of the skin, are finding wide application.

5. One of the most important, but frequently overlooked, methods for the control of occupational disease is *good housekeeping*. Good housekeeping means

(Continued on Page 826)

In Memoriam

MANUEL BALADO

Word has been received of the death of Dr. Manuel Balado on May 23, 1942. He was formerly a Fellow of the Rockefeller Foundation on duty at the Mayo Foundation. At the time of his death he was chief of the clinics at the Institute of Clinical Surgery, University of Buenos Aires, and also was head of the Neurosurgical Service at Santa Lucia Hospital in Buenos Aires.

Dr. Balado was born in Buenos Aires, Argentina, in 1897. He received the degree of M.D. in 1920 from the National University of Buenos Aires; was an intern at the Clinic Hospital from 1919 to 1921; was assistant in surgery for six months to Professor Jose Arce; and was first assistant in teaching in the Institute of Surgery, Medical School of Buenos Aires, from 1921 to 1924. He entered the Mayo Foundation February 2, 1925, and left May 21, 1926.

Dr. Balado received the degree of *Docente libre* in Surgery in 1933 from the University of Buenos Aires. He was a member of the International Congress of Surgery, the International Congress of Neurology and the *Asociacion Medica Argentina*.

ALBERT H. FAGERSTROM

Dr. Albert Harry Fagerstrom, was born in Minneapolis February 2, 1886. He attended the public schools of Minneapolis and subsequently the University of Minnesota. He was graduated from the Marquette University Medical School in 1912, and was an interne at Swedish Hospital. He subsequently practiced medicine in Minneapolis for twenty-six years. In 1922 he married Miss Grace Rudstrom. He was a member of the Hennepin County Medical Society, Minnesota and American Medical Associations. He was a member of Phi Rho Sigma and an active member of the Zion Lutheran Church. He retired from practice on account of illness in 1939 and moved his place of residence to Clearwater, Florida, where he lived until the time of his death, May 1, 1942. He is survived by his wife and one son, his father and one brother.

DOUGLAS T. ORMOND

Dr. Douglas T. Ormond of Waconia passed away August 13, 1942, at the Abbott Hospital, Minneapolis, at the age of thirty-nine. The cause of his death was septicemia.

Dr. Ormond was born January 5, 1903, in Hegbert township, Swift county. He received his high school instruction at Saint John's University at Collegeville, Minnesota, and his medical degree at the University of Saint Louis in Missouri in 1927. His internship was served at Saint Mary's Hospital in Minneapolis.

After an association of several months with Doctors

Halloran at Jackson, Minnesota, Dr. Ormond went to Waconia in January, 1929.

Dr. Ormond was a member of the Scott-Carver County Medical Society, and the Minnesota State and American Medical Associations. He was also a member of the Waconia Knights of Columbus, the Waconia Hunt Club and was on the staff of Saint Mary's Hospital, Minneapolis. Last year he purchased the Frank J. Effertz home and was remodeling it for a hospital.

A glowing tribute was paid to the place Dr. Ormond had made for himself in his community through his services to the sick and afflicted as a practitioner by the local paper, the *Waconia Patriot*.

Dr. Ormond is survived by his father, John Ormond of Appleton, his sister Mrs. A. F. Fluegel of Morris, and two brothers, James Ormond of Appleton and Roy Ormond of Traverse City, Michigan.

HARRY PARKS RITCHIE

An Appreciation

On September 3, 1942, Minnesota lost one of its most distinguished surgeons in the death of Dr. Harry Parks Ritchie. Born in Wellington, Kansas, March 1, 1873, he came to St. Paul with his parents in 1881 and lived there the rest of his life. There probably are many men who knew Dr. Ritchie better and longer, but there are few who are influenced so much by his kindness, conduct of practice, and personality as the author.

Dr. Ritchie—The Teacher

Most of us had our first contact with Dr. Ritchie as medical students. The first time one saw him in the lecture hall one was impressed by his appearance. He was the medical student's ideal of what a successful surgeon should look like. Here was a dignified, well-groomed man with a goatee and a suggestion of a Van Dyke beard. While he was slender of frame and small in stature, one was never impressed by these qualities. His voice was quiet and he had the habit of molding out the words with gestures of his hands as he talked. One thing everybody noticed about Dr. Ritchie was his hands. They were delicate, graceful, and always well cared for.

His lectures were carefully prepared and to the point, but were of such a specialized nature that I am sure most of us did not obtain so much a comprehensive knowledge of plastic surgery as we did awe and wonder that such marvelous things could be performed. Rarely did he make excursions into fields other than the subject at hand. Other instructors used to love to speak of their exploits in the Spanish-American War or the World War. When Dr. Ritchie was asked why he was so reticent of speaking about his experiences in the Spanish-American War he would say, "Oh, they can do it so much more interestingly than I can; I have to concentrate on giving a good lecture to hold the students' interest!"

Dr. Ritchie was connected with the University of Minnesota in a teaching capacity ever since he was in medical school. While in the medical school, he taught in the department of physiological chemistry where he

was closely associated with Dr. Richard Olding Beard, Professor of Physiology, in the newly formed medical school. He was not much older than the students taking the course. He said the thing that saved him as a teacher was the notes of Professor Russell H. Chittenden, under whom he had studied physiology and physiological chemistry at Yale University.

After graduation from the University of Minnesota Medical School in 1896, he had an internship at the City and County Hospital in St. Paul, which is now known as Ancker Hospital. Then came a year of practice with Drs. A. MacLaren and Theodore F. DeWitt. When the Spanish-American War broke out he volunteered his services and on his return from the Philippines became associated with the Department of Gynecology at the University under Dr. Alexander J. Stone. Also at that time, he and Dr. MacLaren used to give a Thursday morning surgical clinic at St. Luke's Hospital in St. Paul. While this clinic was chiefly an operative clinic, nevertheless Dr. Ritchie found time to try to classify the operative specimens grossly and microscopically. Dr. Ritchie often remarked how proud he was of most of the specimens preserved in glass jars; when Dr. MacLaren would turn the clinic over to him he would parade out the specimens, and try to put some "romance," as he called it, into the discussion.

When the newly formed University Hospital opened in 1912, he was appointed to the surgical staff under Dr. James E. Moore. He always spoke of what a happy and ideal association this first group was; this group had much to do with the excellent esprit de corps that has persisted in the surgical department at the University Hospital throughout the years. Dr. James Moore was Chief and Dr. J. Clark Stewart was Associate Chief of the Surgical Service; Dr. Ritchie, Dr. Arthur Law, and Dr. Earl Hare were on one of the services and Dr. MacLaren, Dr. Arthur Strachauer and Dr. Warren Dennis on the other. There were many cancer cases sent to the University Hospital and it was here that Dr. Ritchie first became interested in plastic surgery. After wide surgical removal of the tumor, serious cosmetic deformities often resulted, so Dr. Ritchie became interested in trying to repair the defects with flaps and skin grafts. Seeing his interest in this work, Dr. Moore relegated to him the repair of cleft palates and harelips, which had been anybody's problem up to this time. It was due to the work of Dr. Ritchie and his associates that plastic surgery has reached such a high level at the University Hospital.

Dr. Ritchie was a clinical professor of surgery from 1937 to 1941, and was made professor emeritus of surgery in 1941. At a testimonial dinner given on June 10, 1941, for Dr. A. R. Colvin, Dr. J. Frank Corbett, and Dr. Ritchie, Dr. Ritchie reviewed his years as a teacher at the University. Very modestly he said that he believed he got more out of the school than the school got out of him. Those of us who had him as a teacher, however, know differently.

Dr. Ritchie—The Surgeon

For years Dr. Ritchie had an operative clinic at the University Hospital on Thursday afternoons for the cases with cleft palates and harelips. Before the

operation he would see the baby and quite characteristically would give it a kiss on the forehead. In the dressing-room he usually discussed what he was going to do and during the operation he would explain the procedure step by step. As an operator, he was deliberate, yet gentle, and never seemed to be in a hurry. I think many of the younger men were surprised to see how well he could thread the eye of a very fine needle even in his later years. I can never remember seeing him disturbed or out of sorts in the operating room. He said that the results of his one "blow-up" in the operating room cured him forever. Years before, he had been working hard and really needed a vacation when one day he was doing a rather difficult case with an inexperienced student nurse as his assistant. Finally Dr. Ritchie spoke to her rather sharply, whereupon the nurse burst into tears. Dr. Ritchie was so distressed about it all that he sent the nurse a five-pound box of candy. He said it was a very expensive precedent, however, because thereafter the other nurses would burst into tears at the slightest provocation and he said he was always sending candy to the operating room. He decided that it would be cheaper to take a vacation.

Dr. Ritchie had a wide surgical practice and many of his patients were referred from surrounding states. His greeting to the patient was quite characteristic: "Well, how are you today? I'm so glad to see you. How have you been lately?" Regardless of how busy he was he always made it a point to make that patient feel as if he were the most important person he had seen that day. Children were particularly fond of him; in fact, one of them was asked in Sunday School why he should be good; the reply was: "So I can grow up and be like Dr. Ritchie!"

Dr. Ritchie had a kind word for everyone. When the conduct of one of the younger men was the subject of censure, he would say: "Oh, he'll straighten out after he grows up," and would change the subject of the conversation. If the person happened to be an older colleague, his only comment would be: "Oh, he knows better. He's just having a brain storm."

At medical meetings, Dr. Ritchie liked an atmosphere of dignity, but thought that the papers and discussions should have an air of informality. He rarely missed a meeting of the Minnesota State Medical Association, the American Surgical Society, the Western Surgical Society, or the Saint Paul Surgical Society. His idea of a surgical society was one in which the membership should be rather general with an especial attempt to include the younger men, while the policies were to be governed by the older members. He often said that a successful surgeon was to be judged not by how much money he made or how big his practice was, but by the esteem in which he was held by his colleagues. Considering these criteria, Dr. Ritchie was eminently a successful surgeon.

Dr. Ritchie—The Man

Dr. Ritchie's life was greatly influenced by his associates. He admired and respected his father, Dr. Parks Ritchie, who had been dean and also Professor of Obstetrics at the University of Minnesota Medical School. He characterized his father "as an ideal hus-

band and father who carried with him the teaching of his Presbyterian-minister father in his ideal of service to his patients. He carried in his little black bag, consolation, advice and a great fund of stories and quotations, which so many times emphasized a point or took the strain out of a controversy. Even his bill heads softened the blow, for around the margin were quotations such as: 'Hope is a good breakfast but a poor supper.'

Also, he had a great friendship for his classmates, Dr. W. A. Dennis, Dr. Walter Ramsey of St. Paul, and Dr. Frank Warren of Faribault. He used to say jokingly that he and Dr. Dennis were such close friends because their offices were at different ends of the building and their cases did not often cross. He had almost a brotherly affection for Dr. Arthur A. Law, who had been a boyhood friend and his immediate superior officer in the Spanish-American War. He had the highest admiration for Dr. MacLaren, with whom he was associated in practice for many years. He and Dr. E. Starr Judd used to try to get together once a year to relax and spend an afternoon at a baseball game. With the death of Drs. Dennis, Law, and Judd, Dr. Ritchie often remarked that he lost three of his best friends.

His home life was ideal. Mrs. Ritchie was a devoted and sympathetic wife for whom he had the greatest love and admiration. Occasionally, he would remark, "A doctor is lucky if he has a good-looking, clever wife, who is understanding of his problems, like Mrs. Ritchie." When he tended to work overtime at the office, Mrs. Ritchie would often call him. He would say, "Mrs. Ritchie knows she can always get me home in a hurry if she tells me we are having German potato salad for dinner!" He was an ideal father, and was almost worshipped by his grandchildren. When people asked him how many grandchildren he had, he would remark that he had thirteen yesterday, but Mrs. Ritchie hadn't called him yet this morning to say if the number had increased.

For the past few years his son, Dr. Wallace Ritchie, had been associated with him in practice; in his son he found a worthy successor to carry on the Ritchie tradition in medicine.

While Dr. Ritchie had not been in good health for a few years prior to his death, his indomitable spirit overcame much of his physical weakness. When death came quietly from hypertension with cardio-vascular complications, there was none that did not speak with admiration and respect of his sterling qualities of heart and mind. Few men leave behind them such pleasant memories as a teacher, surgeon, father and friend, as did Dr. Harry Parks Ritchie.

CHARLES E. REA, M.D.
Saint Paul

OCCUPATIONAL HEALTH HAZARDS

(Continued from Page 823)

that everything in the plant should have a definite place and should be kept there. Disorderly plants encourage slovenly habits among the workers. Accumulations of dust and dirt on floors, walls, beams, and rafters tend to increase the general dustiness in the plant atmosphere. Dust can be removed by vacuum cleaning methods. Containers holding materials giving off vapors, fumes, or gases, should be stored or placed so that these substances do not contaminate the general atmosphere.

Efficient Maintenance Necessary

The proper installation of control measures is not sufficient in itself to give lasting protection against toxic materials. The efficient maintenance of these control measures is necessary because ventilation systems and protective equipment sometimes lose part of their original effectiveness. Frequent checks should be made to insure that workers are making proper use of protective devices. When changes in industrial processes or in materials are made, studies should be made to determine potential health hazards.

It is obvious that industrial physicians, as well as the engineering staffs of individual plants, cannot be expected to know all methods and means for the control of occupational health hazards. There are a multiplicity of ideas to be considered. One must, therefore, rely on outside agencies for help in these matters. Such an agency, as most physicians realize, has been recently established in the Minnesota Department of Health. The Division of Industrial Health of this Department provides a medical and engineering advisory service for the investigation and control of occupational health hazards. The engineering personnel of this Division is prepared to study the working environment for toxic concentrations of hazardous materials, and, when necessary, to offer recommendations for the control of these health hazards. As a final word, the industrial physician can facilitate this work by properly reporting occupational diseases, using the forms provided by the Division of Industrial Health.

G. J. RASCHKA, P. H. Engineer,
Division of Industrial Health,
Minnesota Department of Health.

Liberty has never come from government. Liberty has always come from the subjects of it. The history of liberty is the history of resistance. The history of liberty is a history of limitations of governmental power, not the increase of it.—WOODROW WILSON.

I congratulate poor young men upon being born to that ancient and honorable degree which renders it necessary that they should devote themselves to hard work.—ANDREW CARNEGIE.

REPORTS and ANNOUNCEMENTS

MEDICAL BROADCAST FOR OCTOBER

The Minnesota State Medical Association broadcasts weekly at 10:15 o'clock every Saturday morning over Station WCCO, Minneapolis and St. Paul, and at 11:30 o'clock over Station WLB, University of Minnesota.

Speaker: William A. O'Brien, M.D., Director of Postgraduate Medical Education, Medical School, University of Minnesota.

- October 3—General Principles of First Aid
- October 10—The Prostrate Patient
- October 17—Head Injuries
- October 24—Spinal Injuries
- October 31—Wounds of Face and Mouth.

1943 A.M.A. MEETING CANCELLED

The decision to omit the contemplated annual session of the American Medical Association scheduled for San Francisco in 1943 has been announced by the Board of Trustees. Among the many factors which led to the decision were doubtless the large percentage of the profession in service and unable to take part or attend the meeting and so many of these not in service too busy to attend.

The House of Delegates of the association will meet in Chicago instead of San Francisco at a date to be announced. Thus the scientific, but not the organizational activities of the association, will be the ones to suffer mostly.

The annual conference of secretaries of component state associations and editors of state journals will be held as usual in Chicago, November 20 and 21.

AMERICAN ACADEMY OF PHYSICAL MEDICINE

The American Academy of Physical Medicine will hold its Twentieth Annual Scientific Session at the Hotel Statler, Boston, October 14 to 17, 1942. The program will be composed of clinical and scientific presentations involving techniques of importance in Wartime Medicine.

Topics of the discussions and demonstrations include Physical Medicine in relation to Aviation Medicine, Physical Education, Habilitation, Rehabilitation, First Aid, and War Injuries, as well as consideration of the use of physical agents in injury and disease falling within the scope of various medical specialties. There will be symposia on Poliomyelitis and Electrosurgery. Encephalography, Electroshock, Fever Therapy, and Other Special Procedures will be discussed by outstanding authorities.

Speakers will include pioneers in the development of physical medicine in the earlier World War, physicians actively concerned with military medicine, and leaders

in the special medical fields. A clinic will be conducted at the Massachusetts General Hospital. The Academy will have the coöperation of the Massachusetts Institute of Technology and other Medical and Scientific Institutions.

Captain William Seaman Bainbridge, M.C., U.S.N., is the president. The chairman of the Committee on Program is Lt. Col. William D. McFee, M.C., U.S.A.R. Physicians are invited to attend without registration fee. A copy of the official program can be obtained from the secretary-treasurer, Herman A. Osgood, M.D., 144 Commonwealth Avenue, Boston, Mass.

CONFERENCE ON VENEREAL DISEASE CONTROL NEEDS IN WARTIME

Venereal disease and America's war effort will be discussed by high-ranking medical officers of the War and the Navy Departments, prominent physicians, health officers and others at a Conference in Hot Springs National Park, Arkansas, October 21-24, 1942. Headquarters will be at the Arlington Hotel.

The Conference will be held under the auspices of the United States Public Health Service in conjunction with the Eighth Annual Meeting of the American Neisserian Medical Society. Surgeon General Thomas Parran will preside. State and local health officers, venereal disease control officers, practicing physicians, and all others engaged in venereal disease control activities are urged to attend.

Subjects for discussion will include venereal disease control measures influencing the war effort, epidemiology of syphilis and gonorrhea—1942, wartime venereal disease control education, research influencing the wartime venereal disease control program, and techniques of venereal disease education.

AMERICAN COLLEGE OF SURGEONS

The annual Clinical Congress of the American College of Surgeons will be held November 17 to 20, 1942, at the Cleveland Public Auditorium, instead of at the Stevens Hotel in Chicago.

The program will be centered around the many medical and surgical problems incident to the war, including army and navy needs and civilian defense.

The meeting will be addressed by Surgeon Generals James C. Magee, Ross T. McIntire and Thomas Parran of the Army, Navy and Public Health Service, respectively, Lt. Col. George Baehr, Chief of the Civilian Defense, Dr. Frank H. Lahey, chairman of the Procurement and Assignment Service, Dr. Irvin Abell, chairman of the Board of Regents of the College, and Dr. W. Edward Gallie, president of the College.

CLARENCE MARTIN JACKSON LECTURE

Dr. Thomas Francis, Jr., of Ann Arbor, chairman of the Department of Epidemiology at the School of Public Health, University of Michigan, will deliver the Clarence Martin Jackson Lectureship under the auspices of the Phi Beta Pi medical fraternity, on October 21 at 8:15 p.m. in the Museum of Natural History auditorium, University of Minnesota campus. His subject will be "An Interpretation of Current Studies in the Control of Epidemic Influenza."

In addition to his post at the University of Michigan, Dr. Francis is serving as director of the Influenza Commission for the United States Army.

UNIVERSITY ALUMNI CLINICS

The University of Minnesota Medical Alumni Clinics will be held on the University campus, October 22, 23 and 24, in connection with Homecoming Week activities. The Clinics will be largely concerned with "War Medicine and Surgery."

Highlights of the three-day session will be the reunion of the twenty-year class (that of 1922) and the annual alumni luncheon meeting. The latter is scheduled for Friday, October 23.

THE MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular meeting of the Minnesota Society of Neurology and Psychiatry was held at the Town and

Country Club in Saint Paul, Tuesday evening, September 15, 1942. Dinner was served at 6:30 o'clock.

The program for the evening was as follows:

1. Case report—JOEL C. HULTKRANS, M.D.
2. The identification and measurement of the psychoneuroses in medical practice; the Minnesota multiphasic personality inventory—J. C. MCKINLEY, M.D., and STARKE R. HATHAWAY, M.D. (by invitation).

WOMAN'S AUXILIARY

MRS. RAYMOND J. JOSEWSKI, *President*
Stillwater, Minnesota

MRS. W. H. RUCKER, *Publicity Chairman*
Minneapolis, Minnesota

Mrs. R. J. Josewski, president of the Woman's Auxiliary to the Minnesota State Medical Association, has set Friday, October 23, as the date for the autumn meeting of the Board. Arrangements for the luncheon meeting will be made by Mrs. W. B. Roberts of Minneapolis.

* * *

Washington County Auxiliary held its first meeting September 8, with Mrs. J. H. Haines presiding. Mrs. D. Kalinoff was named *Hygiea* chairman, and Mrs. J. W. Stuhr has assumed the duties of publicity chairman. A good year to you, Washington County!

◆ OF GENERAL INTEREST ◆

Dr. J. F. Lynn, former health officer of Waseca, has been reappointed to that office succeeding Dr. George H. Olds who resigned to enter the Army Air Corps.

* * *

Dr. D. E. McBroom has returned to the Colony for Epileptics at Cambridge, after a year's leave of absence.

* * *

Dr. N. O. Pearce of Minneapolis has been appointed social hygiene lecturer in the Minnesota Department of Health, Division of Preventable Diseases.

* * *

Dr. R. J. Cairns, formerly of Sanborn, has moved to Redwood Falls, where he is associated in practice with Dr. J. Gordon Cole in the Cole-Cairns Clinic.

* * *

A course in Diseases of the Heart (Etiology, Pathology, Diagnosis, Treatment) will be given for physicians at the Center for Continuation Study, University of Minnesota, October 12-17.

* * *

Dr. John B. Erich of Rochester presented a motion picture on "Traumatic Injuries of the Face" at a meeting of the Eleventh District of the Wisconsin Medical Society and the Interurban Academy of Medicine in Superior, Friday, August 14.

Dr. Irvine McQuarrie, head of the department of pediatrics at the University of Minnesota, will deliver the Porter Memorial Lectures at the University of Kansas in Lawrence, November 3 and 4.

* * *

Dr. M. M. Hursh of Hibbing has been appointed school physician of Hibbing, succeeding Dr. A. B. Rosenfield who recently was called to service in the Army Medical Corps.

* * *

Dr. L. J. Alger of Grand Forks, North Dakota, has announced the discontinuance of his practice in Otolaryngology and the limitation of his practice exclusively to Ophthalmology.

* * *

Fire which gutted the Butterfield State Bank building at Butterfield destroyed the equipment of Dr. L. M. Hammar and Dr. O. E. Hagen who had offices in the building. The structure, which was the finest two-story building in Butterfield, was gutted from basement to roof, with only the brick walls left standing.

* * *

The American Medical Association has canceled its 1943 meeting to avoid further stress on physicians' time and the nation's transportation facilities.

gates, scientific councils, and Association officials will meet in Chicago in June, 1943, rather than in San Francisco as scheduled.

* * *

Presiding at the annual meeting of the Martin County Nursing Service held September 17 in Fairmont was Dr. G. H. Luedtke, president of the board. Guest speakers included Dr. W. A. O'Brien of the University of Minnesota and Miss Nora Rolf of the Minnesota Department of Health.

* * *

Among guest speakers at the tenth annual clinical assembly of the Omaha Mid-West Clinical Society to be held in Omaha, October 26-30, will be Dr. Arild E. Hansen of Minneapolis, University of Minnesota pediatrics department, and Dr. Harry M. Weber of Rochester.

* * *

Attention of the physicians of Minnesota is called to the request of the Division of Preventable Diseases of the State Department of Health that outdated containers and empty tuberculin or vaccine bottles which are not needed be returned to the office as it is difficult to obtain new equipment of this sort.

* * *

Staff meetings at the University of Minnesota Hospitals are being held "as usual" this year on Friday noons, the first meeting of the 1942-43 series being conducted October 2. This is the fourteenth consecutive year that the general staff sessions have been held. As in the past, talks presented will be compiled into a

mimeographed bulletin and distributed. The subscription fee for the year is \$2.

* * *

Dr. and Mrs. C. W. Lundquist of Winona are the parents of a son, David John, born September 11. Dr. Lundquist, who has been associated with the Winona Clinic, left, October 1, to enter active service with the armed forces. A captain in the army medical corps, he has been assigned to the O'Reilly General Hospital, Springfield, Missouri.

* * *

Dr. William A. O'Brien, director of postgraduate medical education at the University of Minnesota, gave the commencement address at the graduation exercises of the Columbia Hospital for Nurses, Milwaukee Downer College, in Milwaukee, September 10.

Dr. O'Brien also gave the banquet address at the 4-H club dinner, sponsored by the Minneapolis Civic and Commerce Association, September 2, in the Radisson Hotel.

* * *

Among courses for public health nurses scheduled to be held at the Center for Continuation Study on the University of Minnesota campus during the 1942-43 term is one on Mental Hygiene to be given at the Center, October 29, 30 and 31, in conjunction with the health section of the Minnesota Educational Association. Other courses included one on Rheumatic Fever to be given in February and another on Communicable Diseases and Poliomyelitis to be given in May. All are three-day sessions.

The Mississippi Valley Conference on Tuberculosis and the Mississippi Valley Trudeau Society held their annual meetings in Chicago, September 16-18. On September 18, Drs. William R. Lovelace II and Horton C. Hinshaw, Rochester, discussed the "Effect of Reduced Barometric Pressure on Pneumothorax" before the Trudeau Society. On September 17, Dr. J. Arthur Myers, Minneapolis, spoke on "County Accreditation for Tuberculosis Control."

* * *

The American Medical Association has given \$1,000 to the Meeker County Tuberculosis Control Experiment, it is announced by Dr. J. A. Myers of Minneapolis, chairman of the Committee on Tuberculosis of the Minnesota State Medical Association.

The \$1,000 gift and an equal amount from the National Tuberculosis Association contributed previously, will be used to purchase x-ray film.

The experiment, which began in April last year, calls for tuberculin testing of every resident of the county, plus physical examination. Meeker county physicians are giving their services without charge.

* * *

The seventy-seventh annual meeting of the Michigan State Medical Society was held in Grand Rapids, September 23-25. The program was divided into general assemblies and sectional meetings. One feature included ten discussion conferences covering the specialties, in which several Minnesota people participated.

"Nephrosis and Nephritis" was the title of the paper read by Dr. E. Thompson Bell of Minneapolis, and "Pyogenic Infections of the Skin, Particularly Hidradenitis" was discussed by Dr. Louis A. Brynning, Rochester.

Sister Elizabeth Kenny, Minneapolis, participated in the round-table discussion of poliomyelitis; Dr. H. S. Diehl, dean on Medical Sciences at the University of Minnesota, spoke on "Procurement and Assignment."

* * *

When the Kansas City Southwest Clinical Society held its twentieth annual fall clinical conference in Kansas City, Missouri, October 5-8, four Minnesota men were guest speakers at the general assembly sessions. They were: Dr. Walter A. Fansler, of Minneapolis, who presented papers on the "Carcinoma of the Rectum" and "Surgical Treatment of Hemorrhoids"; Dr. Byrl R. Kirklin of Rochester, "Cancer of the Gastro-Intestinal Tract" and "The Present Status of Cholecystography"; Dr. Wesley W. Spink of Minneapolis, "Chemotherapy of Infectious Diseases" and "Toxic Reactions Encountered During Sulfonamide Therapy; and Dr. S. Marx White of Minneapolis, "Management and Training for the Patient with Essential Hypertension" and "The Carotid Sinus Reflex."

* * *

Dr. Miland E. Knapp of the University of Minnesota Medical School staff, and Dr. Earl C. Elkins of Rochester, are newly elected vice presidents of the American Congress of Physical Therapy which met September 9-12 in Pittsburgh.

Dr. Elkins was among those conducting a symposium on fever therapy at the Congress, while Dr. Knapp was

VIOFORM

Victory over infection or fungus growth with VIOFORM, "Ciba" has become a common experience in medicine and surgery. It dries wound secretions and inhibits bacterial growth — it is non-irritating — being almost odorless, it is superior to iodoform. VIOFORM* is useful for impregnating gauze for packing or drainage.

VIOFORM, "Ciba" has steadily gained professional esteem for effectiveness against the *Entamoeba histolytica* and its cysts, where dysentery is present, or for symptomless carriers. The disease may be found anywhere.

ANNOUNCES CONTINUOUS COURSES

SURGERY—Two Weeks' Intensive Course in surgical technique with practice on living tissue, every two weeks throughout the year. General courses of one, two, three and six months. Clinical Courses; Special Courses.

MEDICINE—One-Month Course in Electrocardiography and Heart Disease, starting the first of every month, except December.

FRACTURES AND TRAUMATIC SURGERY—Informal Course available every week.

GYNECOLOGY—Informal Clinical and Diagnostic Courses every week.

OBSTETRICS—Informal Clinical Courses every week.

OTOLARYNGOLOGY—Clinical and Special Courses every week.

OPHTHALMOLOGY—Informal Clinical Courses every week.

ROENTGENOLOGY—Courses in X-ray Interpretation, Fluoroscopy, Deep X-ray Therapy every week.

UROLOGY—Two Weeks' Course and One-Month Course available every two weeks.

CYSTOSCOPY—Ten-Day Practical Course every two weeks.

General, Intensive and Special Courses in All Branches of Medicine, Surgery and the Specialties.

**TEACHING FACULTY — ATTENDING
STAFF OF COOK COUNTY HOSPITAL**

Address: Registrar, 427 S. Honore St., Chicago, Ill.

one of three physicians who conducted a symposium on poliomyelitis.

The Congress presented its annual gold key award to Sister Elizabeth Kenny, Australian nurse, as the person "who has made the greatest contribution to the field of physical therapy" during the past year, and reported that her method of treating infantile paralysis at Minneapolis General and University Hospitals "has been increasingly studied and copied by the medical profession."

* * *

Beginning the fourth year of weekly radio health broadcasts for students in junior high schools, Dr. W. A. O'Brien, director of postgraduate education at the University of Minnesota Medical School, delivered the first talk of the series, September 30. The series, known as "Your Health and You," is broadcast over WLB and the Mutual Broadcasting Company each Wednesday of the school year, from 11 to 11:15 a.m.

The program for October and November follows:

October 7—"Importance of Health Habits."

October 14—"Effect of Good Posture"

October 21—"Disorders of the Feet"

October 28—"Effects of Exercise"

November 4—"Care of the Skin and Hair"

November 11—"Common Skin Diseases"

November 18—"Clothing and Health"

November 25—"Good vs. Bad Air"

Physicians are urged to recommend the program to schools.

* * *

Gifts totaling more than \$100,000 have been accepted by the University of Minnesota board of regents. Among the important medical contributions are:

\$10,700 from the National Foundation for Infantile Paralysis for continued study of the biochemical and physiological aspects of infantile paralysis.

\$10,000 from the National Foundation for Infantile Paralysis to be used for the support of Sister Kenny's work and for the continuation of the instructional program in the Kenny technique.

\$10,410 for Minneapolis General Hospital fellowships.

\$1,800 for Minneapolis General Hospital pediatrics directorship.

\$10,000 from the Home for Children and Aged Women to support the Children's Psychiatric Clinic.

\$7,000 from the National Research Council for research on fat metabolism under the direction of Dr. Arild E. Hansen, Department of Pediatrics.

\$5,160 from the U. S. Public Health Service for the support of a training program for nurse anesthetists.

\$4,000 from the W. K. Kellogg Foundation to establish a loan fund in the school of nursing.

\$3,000 from Sharp & Dohme, Inc., for researches on sulfonamides and in chemistry by Drs. Richard T. Arnold and William G. Clark.

\$1,200 from the Josiah Macy, Jr., Foundation, for support of a study on mechanism of the action of sex hormones, being made by Dr. Leo T. Samuels of the department of physiology.

\$1,200 and \$1,063 from the Rockefeller Foundation for British medical student fund.

\$1,000 from the Winthrop Chemical Company to establish research on pyrocyanine and other related hemo-therapeutic agents, under Dr. Joseph T. King of the department of physiology.

Physicians in Service

Army and Navy medical service appointments include the following Minnesota men this month:

Dr. W. P. Anderson of Buffalo has received a commission as captain and is stationed in Louisville, Kentucky. Dr. Anderson has closed his office in Buffalo for the duration of the war but expects to return following the end of hostilities.

Dr. Frederick P. Arny of Preston is serving as a first lieutenant in the Army Air Corps at Bowman Field, Louisville, Kentucky. Dr. Arny, whose term as coroner at Preston does not expire until the end of this year, will be succeeded by Dr. J. P. Nehring, who has been appointed to fill out the term.

Dr. S. H. Boyer, Jr., has reported for duty at Fort Douglas, Salt Lake City. He has been commissioned captain.

Dr. John L. Delmore, Jr., Roseau, commissioned a first lieutenant in the Army. He is now stationed at Fort Livingstone, Louisiana, where he is studying chemical warfare.

Dr. A. W. Doman, Lakefield, who reported for duty at Camp Barkley, Texas, September 23. He is a first lieutenant.

Dr. George W. Drexler was called to service at Fort Snelling the latter part of August.

Dr. Julius Yale Feinstein reported for duty September 5 at Chanute Field, Illinois.

Dr. John Feuling of Itasca Clinic in Bovey, who ended in the Navy.

Dr. J. E. Frank of Marshall reported in September at Bowman Field, Kentucky air base, where he is serving as captain in the medical corps, U. S. Army.

Dr. R. B. Graves of Red Wing, first lieutenant in the United States Army Air Corps, at Salt Lake City. Dr. Graves has been affiliated with the Medical Block Clinic since 1935.

Dr. Robert G. Hankerson, Minnesota Lake, left September 21 for Bowman Airfield at Louisville, Kentucky, after receiving his commission as first lieutenant in the U. S. Army.

Dr. Donald M. Houston, lieutenant in the U. S. Naval Reserve, reported September 28 for active duty at the Marine Base Hospital, San Diego, California.

Dr. J. C. Klein, Shakopee, commissioned a lieutenant and appointed as assistant surgeon in the medical corps of the Navy. Dr. Klein reports for duty, October 16, at Mare Island, San Francisco.

Dr. Leonard L. Lovshin of Rochester has received instructions to report for duty.

Dr. C. T. McEnaney, Owatonna, captain in the Army Air Force. Dr. McEnaney, a graduate of the St. Louis University Medical School, has been assigned to duty at Salt Lake City.

Dr. R. W. Merrill of Morris reported September 10

to the Great Lakes Naval Training Station, Gre Lakes, Illinois. He has the commission of lieutenant in the United States Naval Reserve.

Dr. John E. Minckler of Virginia, who has been associated with the Malmstrom-Sarff Clinic, first lieutenant in the Army Air Force medical detachment. He reported for duty at Salt Lake City. A graduate of the University of Minnesota, Dr. Minckler served his internship at Ancker Hospital.

Dr. George H. Olds of Waseca has received his commission as captain in the Army Air Corps.

Dr. L. J. Roberts, Columbia Heights, commissioned lieutenant (jg) in the Navy Medical Corps. He reported for duty September 27 at Great Lakes Naval Training Station. During Dr. Roberts' absence, Dr. H. D. Good with whom Dr. Roberts has been associated, will take care of his practice.

Dr. H. A. Shaw of Lake Park reported at Salt Lake City, Utah, September 22, for duty with the Army medical corps.

Dr. G. J. Shima, Sleepy Eye, is serving as surgeon at the Fort Scott Hospital in California.

Dr. Peter Virnig, Minneapolis, who has been named Junior Medical Officer at the U. S. Naval Training School for signalmen, University of Illinois at Urbana. Dr. Virnig, a graduate of the University of Minnesota holds the rank of lieutenant (jg).

Dr. E. E. Zemke, Fairmont, assigned to medical corps of the 115th Cavalry regiment in which he has been a first lieutenant in the reserve since completing medical school. He has been practicing in Fairmont since 1930.

Hospital News

The new Glencoe Hospital, opened early this summer is serving the community under the direction of Miss Clara Draxton, R.N., Superintendent.

* * *

Mrs. Mary K. Olson, formerly of Abilene, Texas, is the new night supervisor at the Staples Municipal Hospital.

* * *

Dr. F. E. Harrington, Minneapolis health commissioner, has been detailed by the Public Welfare Board to take over direction of General Hospital while Dr. D. W. Pollard, present superintendent, is in army service. No successor to Dr. Pollard will be appointed, the position to be kept open pending his return. Dr. Pollard is serving with the commission of Major in the medical corps.

* * *

At the American Hospital Association meeting to be held in St. Louis, Missouri, October 12-16, the usual Minnesota Hospital Association breakfast will be held Tuesday morning, October 13, at the New Hotel Jefferson. Members of the hospital associations in North Dakota, South Dakota, and Montana have been invited

join the Minnesota group this year. Dr. Walter P. Gardner, president, will preside at the breakfast.

* * *

Dr. J. Nelson Ewbank is the new assistant superintendent of the Willmar State Hospital. A successor to Dr. Magnus Peterson, who left the superintendency at Willmar to go to Rochester, has not as yet been named. Dr. George F. Freeman, superintendent of the St. Peter Hospital, is serving as acting superintendent until a successor to Dr. Peterson is named.

* * *

Dr. Magnus C. Peterson has been appointed by the State Director of Public Institutions to the superintendency of the Rochester State Hospital, and assumed his duties there September 1. Dr. Peterson, who has been superintendent of the Willmar State Hospital for the past seven years, succeeds Dr. B. F. Smith at Rochester. Dr. Smith recently accepted a position as superintendent of the St. Joseph State Hospital of Missouri.

* * *

The Redwood Hospital, which recently became a municipal institution, is being remodeled to care for a larger number of patients. Remodeling will add a four-bed ward, a two-bed ward and a single room. It is expected that eventually the hospital will have twenty-four beds. Another improvement will be the addition of an emergency receiving room in the basement, where examining may be done also.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

A BIBLIOGRAPHY OF AVIATION MEDICINE. Ebbe Curtis Hoff and John Farquhar Fulton. Prepared for the Committee on Aviation Medicine, Division of Medical Sciences, National Research Council acting for the Committee on Medical Research, Office of Scientific Research and Development, Washington, D. C. 237 pages. Price \$4.00. Springfield, Illinois: Charles C. Thomas, 1942.

This bibliography brought up to date by the authors with the aid of a score of assistants, lists 6,000 references to the subject in many languages. In this comparatively new field of medicine the number of articles which have already been published is surprising, half of them in the medical field and half in associated sciences. Previously published bibliographies in English and German are included and the references brought up to January 1, 1942, a few which have appeared up to May 31, 1942, included.

The contents are classified under fourteen different headings and the references appear under subheadings such as History, Physiology, Pharmacology, Psychology including the name of author, title of article, journal, et cetera. Additional indices of authors and subjects add value to the volume.

The present world conflict will add much to the bibliography of aviation medicine. This most complete

ORBITAL TUMORS. Walter E. Dandy. 168 pages. Illus. Price \$5.00. Cloth. New York: Oscar Piest, 1941.

This unusual monograph reviews the results of twenty-four cases of orbital tumors treated surgically by the cranial route. Each case history in the series includes the history, physical and neurological examination, roentgenograms, a sketch of each operation (well labeled), gross and microscopic descriptions of the tissues removed and the subsequent course. The cases are also classified into four groups. Summaries of seven additional nonoperative cases are presented.

There is an excellent chapter devoted to a summary of the pathological study of the entire series of cases. A description of the operative procedure used by the author is presented in the most systematic and detailed manner.

The fruits of Dr. Dandy's experiences and results in this monograph are invaluable to the ophthalmologist and convincingly illustrates the necessity for close co-operation between the ophthalmologist and neurosurgeon.

ARCHIE OLSON, M.D.

THE PHARMACOPEIA OF THE UNITED STATES OF AMERICA. Twelfth Revision. Official November 1, 1942. Easton, Pa.: Mack Printing Co., 1942. 880 pages.

Since the first Pharmacopœia was published in 1820 the U.S.P. has contained the very foundation of drug therapy in America. Published every ten years, the next will appear in five years, with a bound supplement in two and one-half years and interim revisions and supplements from time to time.

The rather conservative policy of the publication has resulted in the addition of a new remedy only after it has proven its worth and the removal of remedies only because of its innocuous desuetude.

The coöperation of the British Pharmacopœial Commission in the preparation of U.S.P. XII has been most gratifying. The Committee on Revision has also had the coöperation of Auxiliary Commissions of Cuba, Puerto Rico and the Philippines. In U.S.P. XII the pharmacopœial substances are listed with their corresponding Spanish titles for the first time while the U.S.P. continues to be published in a Spanish edition.

Another new feature of the U.S.P. XII is the addition of the commonly available sizes of tablets, capsules and injections. This was done at the request of physician members of the Committee on Revision.

The U.S.P. XII becomes official November 1, 1942. Besides containing information regarding the preparation of medicinal drugs, it contains a wealth of material about reagents, test solutions, volumetric apparatus and the like, and is as ever most complete.

MAIN 2494

PATHOLOGY OF THE ORAL CAVITY. Lester Richard Cahn, D.D.S. 240 pp. \$5.50. Baltimore: Williams & Wilkins Co., 1941.

"Pathology of the Oral Cavity," being written by a dentist, is especially valuable as a textbook for those in the dental profession. It covers all subjects which the dentist may encounter in his practice, relating to pathology. For diagnostic purposes it is invaluable. The chapter on oral soft tissue lesions associated with avitaminoses opens the door to a subject which hitherto has held a place of little or no importance in the mind of the average dentist. This subject may become one of extreme importance from the standpoint of diagnosis.

Attention is called to the effect of x-ray therapy on the enamel of the teeth, an effect which I believe has so far escaped the attention of a great majority of the dental profession.

The book contains much valuable information set forth in concise, easily understood language. In all, this is a commendable work, well worth a place in anyone's library.

C. W. BENSON, D.D.S.

THE RELATIVITY OF REALITY. René Laforgue, M.D. Translated by Anne Jouard. Nervous and Mental Disease Monographs (No. 66). 92 pages. Price \$2.50. New York: Nervous and Mental Disease Publishing Co., 1940.

The title of this interesting, thought-provoking monograph is taken from the caption of the third of five

chapters entitled "Concerning Anxiety," "On Conflicts in the Affective Development," "On the Relativity of Reality and the Genesis of the Need of Causality," "Reflections Concerning the Intellect," and "Reflections on the Notions of Free Will, of Liberty and of Death."

This presentation is of interest and value to psychiatrists whether or not they employ formal psychoanalytic technique.

The monograph opens with the following quoted paragraph:

"Anxiety and the manifold symptoms to which it may give rise form an important chapter in clinical psycho-analysis. We are here concerned with a group of patients including those suffering from phobias and hypochondriasis, in whose symptomatology anxiety is very much in the foreground. Among others, by way of contrast, such as those with obsessions, hysteria, paranoia, schizophrenia and frustration neuroses, anxiety is no longer in evidence, being concealed behind the defense barrier invented by the patient in order to escape from it. Both the manifestation of defense and the anxiety itself may be more or less apparent, according to the case. But, according to Freud, anxiety remains at the center of the problem of neuroses. And it is the study of neuroses that has made clear the role of anxiety in the development of civilizations. Thus in order to understand civilization and the place it occupies in the psychic economy of man, it is necessary first to study anxiety as seen in the neurosis."

A good discussion of anxiety is then presented.

Next the circumstances in which the individual must face anxiety in the course of its development and the causes likely to increase anxiety in a pathological way

VOCATIONAL HOSPITAL

... An integral part of the Miller Vocational High School offers two special features—Patients receive a maximum of personal attention from student practical nurses—All food is prepared under the direction of a qualified dietitian. Patients remain under the care of their own physicians.

Physicians may secure services of Vocational nurses by calling Nurses Headquarters and asking for a Vocational Nurse

Bridgeport 2281

5511 South Lyndale

Minneapolis

are presented. The way in which anxiety is handled in a healthy manner and the influence of anxiety on the development of intelligence and conscience of the individual and the group are later delineated.

Concerning the relativity of reality, the following quotations are illuminating:

"The conception of reality, as we see it, is therefore in a large measure a function of development of the libido of the ego, both individual and collective. It would seem that this development must of necessity go through oral, anal, and genital stages before arriving at the conception of reality as it appears to us. Even then, as regards the course of this development there are countless individual variants, according as certain individuals and groups, by reason of fixations, arrive at only partial marshalling of the libido of their ego which is held captive at oral or anal stages." Thus it is stated: "In the course of the ego's development there appear first, magic-thinking and the animistic conceptions, then religious thought and the poly- or mono-theistic concept. This concept is slowly transformed into a scientific concept while the ego achieves the synthesis of all the libido impulses capable of utilization in conscious life." Again: "As a result we seem to distinguish three different levels of reality: magic reality, religious reality and scientific reality, including numerous transitional planes among those three, and it would seem that the way they are conceived is, in a large measure, a function of the development of the ego and of the need of causality."

The "intellect" is next discussed. By intellect is meant "the sum total of aptitudes which the ego of an individual utilizes in seeking to face reality with a scientific approach."

The discussion attempts to apply the considerations previously noted to present everyday life. Four groups of intellects are recognized: the intellect with oral predominance, that with anal predominance, that with anal predominance but with a genital component, and the intellect with genital predominance.

Intellectual types in a pure state are seldom actually met with. It is emphasized that the intellect of genital predominance is not "at all times better equipped than the anal type of intellect to defend our contemporary civilization."

The discussion of free will, liberty, and death is based on the ideas developed in preceding chapters. The concluding remark, which cannot be fairly judged without careful study of its context, is most interesting: "The march of ideas and the clash of opinions which constitute what we call today fascism and communism for example, appear to me to be one aspect of this profound psychic process, of this gestation of life seen in the developmental activity of the collective ego of society today."

The chief value of this monograph lies in its ability to provoke careful thought. One need not agree with its material to profit from its study.

WALTER P. GARDNER, M.D.

I insist that it is the duty of the whole people never to intrust to any hands but their own the preservation of their own liberties and institutions.—LINCOLN.

FOR NERVOUS DISORDERS

Operated In Connection
with

Homewood Hospital

Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.

MEAD'S BREWERS YEAST

is proving of increasing value as a routine part of the patient's diet in treating such symptoms as nausea, vomiting, dyspnea, pains in legs and arms, muscle weakness and fatigue.

In one series, it was found that the physical, mental and emotional status of 120 pregnant and lactating women receiving Mead's Brewers Yeast and other foods rich in vitamin B was superior to that of a control group of 116 women.

Mead's Brewers Yeast contains the entire vitamin B complex, including thiamine, riboflavin and nicotinic acid. It may be given in tablet form and/or in powder form. The powder may be quickly shaken up with milk in an ordinary cocktail shaker. It also mixes well with tomato juice or ketchup.

Each Mead's Brewers Yeast Tablet contains not less than .06 mg. thiamine (vitamin B₁), .02 mg. riboflavin (vitamin G), and .15 mg. nicotinic acid, together with other factors of the vitamin B complex commonly occurring in nonviable brewers' yeast.

Smoking... Nicotine

—and the Strain of **CURRENT LIFE**

A way to encourage patient's cooperation in adjusting smoking hygiene

IN these unsettled times, individuals may tend to display baffling, sub-clinical symptoms. The relationship of these symptoms to smoking and nicotine absorption can be an interesting subject for exploration.*

However, the success of the physician's program is dependent upon the patients' full cooperation.

Your recommendation of Camel cigarettes can be an aid in this direction. Millions of smokers favor slow-burning Camels for their extra "pleasure factor"—true mildness, rare flavor.

Given adequate support by patients, the physician may find case histories more reliable. In addition, the segregation of such data may facilitate valuable group analyses.

LACTOGEN
approximates
women's milk in the
proportion of
food substances

THE cows' milk used for Lactogen is scientifically modified for infant feeding. This modification is effected by the addition of milk fat and milk sugar in definite proportions. When Lactogen is properly diluted with water it results in a formula containing the food substances—fat, carbohydrate, protein, and ash—in approximately the same proportion as they exist in women's milk.

No advertising or feeding directions, except to physicians. For free samples and literature, send your professional blank to "Lactogen Dept.," Nestlé's Milk Products, Inc., 155 East 44th St., New York, N. Y.

"My own belief is, as already stated, that the average well baby thrives best on artificial foods in which the relations of the fat, sugar, and protein in the mixture are similar to those in human milk."

A TIMELY SUGGESTION:

Group U-V Irradiation of Workers on the War Production Line

Now that the Nation looks to the Medical profession for every possible help toward keeping our war workers physically fit and on the production line, routine ultraviolet irradiation would seem a timely suggestion.

As a supplement to other hygienic measures in industrial medicine, general body irradiation with mild doses of ultraviolet two or three times a week has proved highly beneficial to miners and factory workers—tending to build up resistance against respiratory diseases which exact such a heavy toll in man-hours lost to production.

Pictured above is a typical installation for this purpose. Paired G-E Hot Mercury Quartz Lamps are placed on each side of a passageway between

shower-room and locker room. A moving hand-rail serves to correctly time the interval of exposure for each individual passing between the lamps. Requires just a few minutes, routinely, two or three times a week.

What could more effectively offset the sparse sunshine of winter months, and the pent-up existence of the great majority of war workers?

Further information, including a blue-print giving details for such an installation, will be sent on request. Ask for Pub. No. C111.

Anniversaries of Progress . . .

SULFADIAZINE

Lederle

ONE YEAR AGO *Lederle* made available to the medical profession a new sulfonamide which represented at that moment the highest development achieved by synthetic chemists in their search for perfection in the sulfonamide field. During that year "SULFADIAZINE *Lederle*" has been hailed throughout the civilized world—the world of free peoples and free scientists—as a medicament of unusually low toxicity, exceptionally high effectiveness and uncommonly broad applicability. Sulfadiazine is a "drug of choice" in many instances.

TWO YEARS AGO physicians in the United States, Canada and England were investigating "SULFADIAZINE *Lederle*" with the keenest interest. The most concentrated study yielded results that exceeded all previous expectations. The names of these physicians was a roster of the great in medicine.

THREE YEARS AGO the chemical and pharmacological investigations upon this new drug were being conducted with exceptional intensity by the Lederle-American Cyanamid research group. The brilliant collaboration of synthetic chemists and pharmacologists established the firm foundation upon which the structure of the final product was reared.

FUTURE YEARS will yield many such anniversaries of scientific progress for the benefit of mankind. We pledge ourselves to the future development of chemotherapy and we shall judge our success by the recognition given to the services we render for the masses of common men.

PACKAGES:

"SULFADIAZINE TABLETS *Lederle*"

Bottles of 50, 100, 1,000 tablets—0.5 Gm. (7.7 grains) each

Sterile Powder: Bottles of 5 Gm.

"SODIUM SULFADIAZINE STERILE *Lederle*" (Powder)

KALAMAZOO, MICHIGAN

The rationale of a complete infant formula in wartime

YOUR TIME has never been so precious.

There has never been a greater need than now for the physician to seek out and use every possible time-saver.

Such a timesaver is Biolac.

Biolac formulas take practically no time to compute, because Biolac provides *completely* for *all* nutritional needs of the normal infant except vitamin C. There are *no extra* formula ingredients to be calculated.

Since Biolac requires only simple dilution with boiled water, as you direct, the possibility of formula contamination or accidental omission of

ingredients by mothers is minimized. You are assured that the baby will get *all* the nutritional elements you prescribe . . . in amounts equal to or exceeding recognized optimal requirements.

For samples and professional information about Biolac, write Borden's Prescription Products Division, 350 Madison Ave., New York City.

NO LACK IN BIOLAC

Borden's complete infant formula

★Biolac is prepared from whole milk, skim milk, lactose, vitamin B₁, concentrate of vitamins A and D from cod liver oil, and ferric citrate. It is evaporated, homogenized, and sterilized.

Just an Old Metal Tube

Today metal is vital; it is needed to produce our implements of Victory—guns, tanks, jeeps, aircraft, munitions ...— Today you cannot buy a tube of shaving cream or toothpaste without turning in an old tube. When this conservation order was proclaimed there were the usual few persons who griped about it. But then there are always a few “gripers” on hand—you know, sourpusses who complain about everything, blame everybody but themselves, and contribute absolutely nothing to the common good. Come to think of it, though, it's perhaps a good thing we have such persons; they serve as a comparison by which we can appreciate the simple greatness, the kindness and

ruggedness and good humor of the average American, who uncomplainingly shoulders his country's burdens, jokes about the effect on himself of the rationing of foodstuffs and gasoline and rubber, and has his own unprintable opinion of *Hoarders* and *Gripers* ...— Funny, but an old metal tube has almost become a symbol of our national character. Every day hundreds of thousands of persons turn in old metal tubes, and in the aggregate these tubes represent a considerable quantity of metal—not only metal in the literal sense, but figuratively the mettle of a people who know that the winning of this war depends on every single one of us contributing his full share, even though it be just an old metal tube.

WHERE OLD FRIENDS HOLD REUNION—

★
Old friends of yours—products which you use day after day—fill the shelves of our Jobbed Drug Section from floor to ceiling. Such well known labels as Cutter Laboratories, J. T. Baker Chemical Company, Parke-Davis, Mallinckrodt, John Wyeth, Winthrop, Eli Lilly, E. R. Squibb, Abbott, Fritzsche Bros., Sharp & Dohme, Merck, Ciba, Upjohn and others appear

on these shelves. Every type of product is included—chemicals, biologicals, ampoules, stains and reagents, volatile oils, drug room supplies, general pharmaceuticals and ethical pharmaceutical specialties.

This big stock is one of the many reasons why we are able to give you an outstanding drug service—24-hour delivery on practically every order.

While it is impossible to list all of the stocked items, a partial listing can be found in your copy of the P & H catalog. For fast, thorough service be sure to use this catalog as your drug buying guide.

*I like S-M-A!**

IN INFANT FEEDING ...IT SAVES MY TIME

- Directions on how to mix and feed S-M-A can be explained to the mother and nurse in two minutes.
- S-M-A is more easily digested by the normal infant because of the all-lactose carbohydrate and the unique S-M-A fat.
- With S-M-A nothing is left to chance. All the vitamin requirements, except ascorbic acid, together with additional iron are included in S-M-A in the proper balance, ready to feed.
- S-M-A fed infants compare favorably with breast-fed infants in growth and development.

Prescribe S-M-A!

*S-M-A, a trade mark of S.M.A. Corporation, for its brand of food especially prepared for infant feeding—derived from tuberculin-tested cow's milk, the fat of which is replaced by animal and vegetable fats, including biologically tested cod liver oil, with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and physical properties.

THE USE AND ABUSE OF THE SULFONAMIDES

ALEX E. BROWN, M.D.

Rochester, Minnesota

BECAUSE we learn largely through experience, and profit particularly from our past mistakes, I think that it is worth while to discuss some of the errors of sulfonamide therapy which experience has shown that it is possible to avoid. Mistakes in this field may be roughly grouped into three main classes: (1) those concerned with choice of a drug or selection of a disease for treatment, (2) those concerned with dosage of the drug and (3) those concerned with toxicity of the drug (the most important group).

Mistakes in the first group usually are due to selection of a drug which is unsuited for the infection to be treated. Thus, it is an error to use sulfanilamide, which is largely effective against beta hemolytic streptococci, for treatment of infections produced by pneumococci or staphylococci. Sulfanilamide is also unsuited for treatment of infections produced by unknown organisms, because these infections may be caused by pneumococci or staphylococci. For staphylococcal infections sulfathiazole seems the preferable drug, although sulfapyridine or sulfadiazine can be used. For pneumococcal infections, sulfathiazole, in general, probably has some preference over sulfapyridine because of its lower toxicity and, by the same virtue, sulfadiazine has some preference over sulfathiazole. Sulfadiazine, sulfapyridine or sulfathiazole can be used for treatment of infections of unknown cause, for each is effective for beta hemolytic streptococci as well as pneumococci and staphylococci. Errors in this first group also occur when an attempt is made to use a sulfonamide drug against diseases which experience has shown fail to respond to such treatment. Among

some of the diseases of this type are chronic infectious arthritis, acute rheumatic fever, tularemia and various virus infections, including the common cold.

Errors in the field of drug dosage are equally serious, whether they are due to the giving of too much drug or too little drug. We are likely to forget in treating mild infections, and particularly infections involving the urinary tract, that amounts of a sulfonamide drug of as little as 2 to 3 gm. (30 to 45 grains) administered daily in divided doses to the adult person usually will give as satisfactory results as will larger doses. Unnecessary and large doses have the disadvantage that they may disturb the patient, and may do so to a degree that necessitates discontinuance of use of the drug before cure is effected. On the other hand, in infections of moderate severity such as pneumonia and of marked severity such as bacteremia and meningitis, it is necessary to use large doses of drug initially in order to obtain a sufficiently high concentration of the drug in the body to control the infection before organisms have multiplied excessively and before extensive foci of tissue destruction have been set up. In infections of moderate to marked severity, therefore, the effort should be made to obtain from the initial doses of the drug the concentration of drug desired, and then merely to maintain this concentration by subsequent daily doses of drug. This is in contrast to early methods, in which small initial doses of drug were given and the concentration was gradually raised by increasing daily doses of the drug as the patient's condition became increasingly worse from day to day.

Errors frequently are made in serious infections by waiting to complete every detail of the diagnostic pattern before treatment is started.

From the Division of Medicine, The Mayo Clinic, Rochester, Minnesota. Remarks made in the Symposium on Therapeutics at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 30, 1942.

Thus, a delay of a day or two before starting treatment, while awaiting some laboratory report such as a blood culture may mean the difference between success and failure in a severe infection. In these conditions it is necessary also to continue to maintain the desired high concentration of drug in the body until complete recovery has occurred, for an appreciable decrease in this concentration may permit a relapse. Unfortunately, also, recurrences may ensue in severe infections if some amount of drug is not administered for as long as three weeks after the fever has subsided and clinical recovery has seemed to occur. The reason for this may be readily understood if the fact is borne in mind that use of the sulfonamides neither accelerates nor hinders the formation of antibodies and other immune processes, and therefore confers no special immunity to specific infections.

Errors associated with drug toxicity undoubtedly form the largest group of errors resulting from use of the sulfonamides. It seems to me that many of these mistakes probably could be eliminated at the outset if all patients were grouped prior to treatment so that sulfonamide treatment could be judged to be either an optional or an essential measure. In the classification in which sulfonamide therapy is considered to be optional, all infections should be included for which the ordinary prognosis is good and for which other satisfactory measures of treatment are available. Such diseases as gonorrhea and tonsillitis would thus be included in this group. When sulfonamide treatment is considered to be optional it is not justifiable to ignore evidences of moderate toxicity and to continue use of the drug when such symptoms occur. On the other hand, in severe infections, such as meningitis and bacteremia, the fact that the prognosis ordinarily is poor and the fact that sulfonamides usually are the sole reliable measures of treatment make the use of sulfonamide drugs an essential therapeutic measure; that is, essential if one is to hope for recovery. Under the latter circumstances, continued use of a sulfonamide drug is sometimes justified when toxic symptoms occur which would contraindicate its use if treatment were to be considered purely optional. Serious errors have been made all too frequently in the past when some patient who had mild disease, such as gonorrhea, continued to receive a sulfonamide drug in spite of recurring or persisting marked symp-

toms of headache, vertigo, nausea, anorexia and the like. These symptoms frequently precede more serious complications and necessitate discontinuance of sulfonamide when it is being used as an optional measure. The same is true of a cutaneous rash, which may terminate as exfoliative dermatitis. On the contrary, however, when sulfonamide treatment is considered essential, the drug under such conditions may continue to be administered with caution or a change may be made to another sulfonamide under close observation, because in such an instance sulfonamide treatment seems essential to recovery. Many errors will be avoided if all patients receiving appreciable amounts of a sulfonamide for a few days have blood counts at frequent intervals, as indicated by the condition of the patient and the previous value of the blood count. I am sure that all patients receiving sulfathiazole, sulfapyridine or sulfadiazine in appreciable amounts should have their urine examined daily and their intake and output of fluid carefully checked. Probably the majority of renal complications could be avoided if all patients receiving these drugs were treated according to a regimen which included a fluid intake of at least 3,000 c.c. and a urine output of 1,400 c.c. These drugs are practically entirely eliminated in the urine, and a high fluid balance of course allows a greater degree of dilution of drug with less opportunity for renal damage. Under these circumstances, also, when there is a decrease in the output of urine or when symptoms of renal colic or hematuria arise, it is possible to detect the disturbance at a time when the margin of safety is greater, because of the high output of urine, and use of the drug usually may be discontinued before serious renal damage occurs. In the final analysis, it seems to me that most errors concerned with drug toxicity occur from a lack of observation and a failure to detect toxic complications early and to heed them, rather than to a lack of knowledge of action of the drugs. Most of us have sufficient knowledge to enable us to use the sulfonamides intelligently, but most of us also have been guilty of contributing to the abuse of these drugs at some time because we have failed to detect or heed warnings of toxicity when they have occurred and have failed to discontinue the use of the sulfonamide when its further use was attended with unnecessary risk.

HYPERSENSITIVITY TO THIAMINE HYDROCHLORIDE

WILLIAM SAWYER EISENSTADT, M.D.

Minneapolis, Minnesota

WITH the advent of parenteral administration of thiamine hydrochloride (vitamin B₁), there have appeared in the literature a number of untoward reactions. Of these reactions, some can be classified as toxic, while others have been true allergic reactions. During the past year, two cases of hypersensitivity to thiamine hydrochloride have been studied. They are presented here, together with a review of the literature dealing with unusual reactions to thiamine hydrochloride.

Review of the Literature

Hecht and Weese¹ in 1937, were the first to demonstrate the lethal effect of massive doses of thiamine hydrochloride given intravenously in experimental animals.

In the same year, Perla² produced adverse effects on animals by giving excessive doses of thiamine hydrochloride.

In December, 1938, Steinberg³ reported five cases of untoward effects resulting from the use of large doses of thiamine hydrochloride. However, of these five cases, only two are suggestive of true allergic reactions. Both of these patients experienced constriction of the throat and a fullness in the epigastrium almost immediately following intravenous administration. In addition, one of these patients developed nausea. In the three other cases reported, herpes zoster developed following intensive vitamin B₁ therapy. This was apparently a toxic reaction, and the resultant effect was an irritation of the peripheral nerve endings. This was the first report to suggest the possibility of allergic or toxic reactions to vitamin B₁ in humans. Unfortunately, in the above two suspected allergic reactions, neither intradermal nor passive transfer tests were carried out to establish an allergic etiology.

In May, 1941, Mills⁴ reported a number of cases of unusual symptoms to thiamine hydrochloride, which he ascribed to thiamine overdosage. The nature of the symptoms do not suggest a development of hypersensitivity, but rather a true toxic reaction due to overdosage. These symptoms resembled those of overdosage with thyroid extract. They were: headache, increased

irritability, insomnia, palpitation, rapid pulse, weakness, tremor, nausea and sometimes vomiting.

In July, 1941, Laws⁵ reported a case in which the following symptoms occurred thirty minutes after the subcutaneous injection of thiamine hydrochloride: violent sneezing, edema of the lips and eyelids, the appearance of large urticarial wheels on the entire body, and a feeling of tightness in the chest. The patient then became very dyspneic and cyanotic, at which time audible wheezing was present. Symptoms were controlled by the subcutaneous administration of epinephrine hydrochloride. Intracutaneous and passive transfer tests were carried out in this case, both of which were positive.

About the same time, Stiles⁶ reported two cases of apparent sensitivity to thiamine hydrochloride. Intracutaneous tests were positive. Passive transfer tests were not attempted in these cases. The symptoms in these cases, such as increased pulse rate, excessive nervousness, profuse perspiration, and a feeling of agitation and panic resembled very closely those described by Mills, which he ascribed to overdosage. The usual allergic or anaphylactic manifestations encountered after parenteral therapy were entirely missing. The symptoms in these two cases appear to be due to overdosage rather than a true hypersensitivity to vitamin B₁. Regardless of the positive intracutaneous tests obtained, the validity of the specificity of these positive tests must be questioned, since I have observed irritating qualities of thiamine hydrochloride on intracutaneous injections if very dilute solutions are not used.

In November, 1941, Schiff,⁷ in discussing a paper by Joliffe on the use of parenteral vitamin therapy in neuropsychiatric disorders, reported a case of severe anaphylactic reaction following the intramuscular injection of 25 mgms. of thiamine hydrochloride. Previous to this injection, the patient had received fifty-seven intramuscular injections of thiamine hydrochloride. Within a minute or two after the fifty-eighth injection, the patient became nauseated and vomited, voided involuntarily, and collapsed. Respiration ceased and the patient became pulseless. With the aid

of immediate artificial respiration and intravenous epinephrine hydrochloride, the patient eventually recovered. After recovery, the patient stated that she had noted sneezing after the last three or four injections. Scratch tests in this case were strongly positive. Passive Transfer Tests were not carried out. In the same discussion, Mills⁸ reported a case of sudden death following parenteral administration of thiamine hydrochloride. Autopsy in this case revealed multiple ecchymoses beneath the pia over both cerebral hemispheres, with areas of encephalomalacia and perivascular hemorrhage. The cause of death in the above case was undoubtedly an anaphylactic reaction.

In addition to the above reported cases, the following two cases have been observed by me within the past year:

Report of Cases

Case 1.—E. R., white, male, aged twenty-four, with a diagnosis of peripheral neuritis, was placed on vitamin B₁ therapy. Both oral and parenteral therapy were jointly employed. The patient received his first injection in May, 1941, and received 25 mgms. parenterally every third day for ten doses. The patient showed a marked improvement and therapy was stopped.

Two months later, the patient's symptoms returned, and parenteral thiamine hydrochloride was again given. After the fourth subcutaneous injection, the patient complained of marked swelling and itching at the area of the previous injection. He stated that this occurred after the third injection, but was much milder. Parenteral therapy was immediately stopped and intradermal tests with the commercial vitamin B₁ were done, which were markedly positive. In fact, the patient complained of itching at site of the tests for twenty-four hours after the intradermal tests were done. On further testing with pure crystalline thiamine hydrochloride dissolved in an aqueous solution, the intradermal tests were again positive. The intradermal tests with the preservative contained in the commercial preparation were negative. Passive transfer tests were carried out on a number of persons, but they were all negative. The above illustrates a case of local anaphylaxis which involved the area of injection. Possibly if further parenteral therapy had been continued, a general anaphylactic reaction might have occurred. Subsequently, the patient continued to take thiamine hydrochloride orally without any adverse effects.

Case 2.—Miss D. B., white, female, aged thirty-one, first received subcutaneous thiamine hydrochloride in August, 1940. She received daily injections for twenty-four days during her hospital stay. After her release from the hospital, the patient continued to receive injections at intervals of seven to ten days.

In June, 1941, after one year of continuous parenteral therapy, about five minutes after receiving a subcutaneous injection of vitamin B₁, the following symptoms

appeared: angioneurotic edema of tongue, lips and eyes, a peculiar fullness and itching of the ears, and violent sneezing. Her skin then became hot and itched unbearably. The symptoms disappeared fifteen to twenty minutes following subcutaneous epinephrine hydrochloride. The following week a similar but milder reaction resulted following a very minimal subcutaneous injection. The patient was then referred to me for possible hypersensitivity to thiamine hydrochloride. Intradermal tests to both commercial and aqueous solutions of thiamine hydrochloride crystals were strongly positive. Intradermal tests for the preservative used in the commercial preparation were negative. Passive transfer tests, however, were entirely negative. The patient subsequently continued to take thiamine hydrochloride orally without any adverse effects.

Discussion

In analyzing the above two cases, there were a number of striking similarities.

Even after the allergic reaction appeared, both patients subsequently tolerated thiamine hydrochloride orally. Why these patients were able to tolerate vitamin B₁ orally, and yet showed definite allergic reactions to parenteral thiamine hydrochloride is hard to explain. One may theorize on the possibility of the existence of a rather high threshold of sensitivity to vitamin B₁ in these individuals and that the concentration of thiamine hydrochloride taken orally was never at a sufficiently high level at any one time to evoke an allergic reaction. An analogous situation exists in the normal intake of vitamin B₁ in the daily diet.

The immunological response shown was identical with that experienced with well-known sensitizing proteins such as horse serum. Normally, the latent or incubation period to produce sensitization does not exceed seven to ten days. As long as injections of thiamine hydrochloride were given at an interval of less than seven days, no constitutional reactions resulted, but when the interval exceeded one week, in both cases an anaphylactic reaction resulted. The clinical importance is evident in that the possibility of an allergic reaction following parenteral administration increases as the interval between injections is lengthened.

Another similarity present in both cases was the presence of positive intradermal tests and the absence of positive passive transfer tests. However, it has often been demonstrated that definite clinical sensitivity may exist even in the absence of demonstrable circulating antibodies.

This may be explained by the presence of serum of low antibody titre.

Summary and Conclusions

1. A review of the literature of untoward reactions to thiamine hydrochloride has been made.
2. Reactions to thiamine hydrochloride have been both toxic and allergic in nature.
3. Five cases of apparent sensitivity to thiamine hydrochloride have thus far been reported.
4. Two more cases of thiamine hydrochloride sensitivity have been added to the literature.
5. With the definite establishment of the possibility of thiamine hydrochloride sensitivity, the skin testing of patients who are about to receive thiamine hydrochloride parenterally may be a

wise precautionary measure, especially if previous administration has taken place.

Grateful acknowledgment is made to Dr. A. B. Litman and Dr. Alex Blumstein for making these cases available for study.

THE DIAGNOSIS AND TREATMENT OF LICHEN PLANUS

CARL W. LAYMON, M.D.

Minneapolis, Minnesota

LICHEN PLANUS in its usual form does not present a difficult diagnostic problem since the typical flat, angular, violaceous, waxy papules are readily recognized. More and more, however, dermatologists have come to recognize the multiplicity of clinical features the disease may present. There is a wide variation in the color and arrangement of the lesions in lichen planus; they may be atrophic or hypertrophic and subjective symptoms may be lacking or intense. The chief purpose of this discussion is to briefly review the more unusual types.

Those who have studied large series of cases of lichen planus such as Little,²¹ White,⁴⁰ Culver,⁸ and Jacob,¹⁷ have noted that the extremities are the most common sites of involvement, that lesions occur on the trunk in about a third of the cases, on mucous surfaces in about 20 per cent, on the male genitals in about 25 per cent, and universally in about 20 per cent of the cases. The face, scalp, palms, soles, and perineum are involved only rarely. According to Culver⁸ lichen planus occurs in less than 2 per cent of patients presenting themselves because of cutaneous disease. About 80 per cent of all cases occur

between the ages of twenty and sixty, and the disease is extremely rare in children. Figures concerning the relative incidence in males and females vary among different observers.

The disease usually develops insidiously and follows a chronic course of months to years. It may remain quiescent for months after the original outbreak but is usually characterized by exacerbations and remissions. The occasional acute case may appear as an exanthem, even becoming generalized within one to a few days. The disease may disappear spontaneously but in most untreated cases tends to persist. Lord²² reported four distinct recurrences of lichen planus in a series of thirty-three cases, which in his opinion gravitated against the prevailing impression that recurrences are extremely uncommon. In a general way it may be said that the prognosis is good if suitable treatment is carried out for a long enough period of time.

Lichen Planus of Mucous Membranes.—Although involvement of the mucous membranes in the ordinary type of lichen planus is not unusual, instances in which the disease is confined to the oral cavity are uncommon. Fox,¹¹ in 1931, described ten such cases and excellently discussed

From the Division of Dermatology, University of Minnesota, H. E. Michelson, M.D., Director; and the Dermatology Service, Minneapolis General Hospital, S. E. Sweitzer, M.D., Chief.

the frequency, diagnosis, duration, and response to treatment of this form of the disease.

The lesions, which as a rule were of several months' duration, were found on the buccal mucosa of the cheeks, usually opposite the interdental cleft. In some, the dorsum of the tongue, the upper lip, and the soft palate were affected.

The eruption consisted of superficial, grayish-white lesions in the form of minute puncta, linear streaks, circles and reticulated or solid areas. Although in most cases the lesions were smooth, there was slight roughness in a few.

Subjective symptoms, when present, consisted of a burning sensation or soreness. Since the subjective symptoms are so mild, lichen planus of the mouth is most important from the diagnostic standpoint since it is frequently mistaken for leukoplakia. Fox felt that in the differential diagnosis between lichen planus confined to the mouth and leukoplakia difficulty arose only in the early stages of the latter. Lichen planus does not affect the commissures to any great degree whereas in leukoplakia this is a favorite location. Lesions in the form of fine dots, circles, or reticulated areas are not characteristic of leukoplakia. In contrast to the latter, erosions or ulcerated areas are almost always absent in lichen planus. Histologic examination is an additional aid in diagnosis.

Lichen planus of the lips is also a rarity. The lower lip is more commonly affected and as a rule is accompanied by lichen planus of the buccal mucosa. Douglass Montgomery,²⁷ who reported ten cases in 1938, stated that the clinical appearance of the lesions on the lips resembled that in the mouth, i.e. stripes, rings, stars, lace-work and dots shining through the upper layers of the epithelium. Montgomery also mentioned that lichen planus of the lips may appear as a cheilitis with erosions, purulent discharge and tightly adherent crusts.

Reports concerning lichen planus of the conjunctivæ are extremely rare. Gaucher and Druelle,¹³ in 1904, referred to lesions on the lower palpebral conjunctivæ as part of an extensive lichen planus. In 1924, Luhr²³ reported a case of generalized lichen planus in which the bulbar conjunctivæ showed several sago-like bodies. I have had the opportunity to observe one case of the disease in which there were lesions on the bulbar conjunctivæ and on the margin of the lower lid of the left eye.

Lesions of lichen planus similar to those occurring on other mucous membranes are seen rarely on the nasal mucosa.

The description of the eruption in the mouth may also be applied to that occurring on the mucosa of the female genitals. In many cases there is simultaneous involvement of the mouth and vulva. The question of atrophic lichen planus of the vulva and lichen sclerosus et atrophicus of this region will be discussed later.

Lichen planus of the male genitals usually gives rise to no diagnostic confusion. Culver found that the penis was affected in 25 per cent of 148 cases, the eruption appearing as grouped or isolated papules, rings or reticulated areas. Similar lesions may be present, though less frequently, about the anus and perineum.

Annular Lichen Planus. Annular lesions in lichen planus occur in about 10 per cent of cases according to Little,²¹ ranking second in frequency only to the hypertrophic variety. Little believed that annular lesions developed from a large single papule which cleared in the center rather than from a group of smaller papules. It has been shown since, however, that such lesions may develop in either way.

Linear Lichen Planus.—The well-known tendency of lichen planus papules to appear in lines may be exaggerated to form this type. Little noted that linear lichen planus appeared most commonly in children. Linear lesions may occur either on the trunk or extremities. None of the theories which have been advanced to account for the occurrence of eruptions in linear arrangements are entirely satisfactory. Hypotheses concerning distribution along the course of blood or lymph vessels, nerves, Voight's lines or dermatomeres, do not explain all cases of linear eruptions. Senear and Caro³⁴ after carefully studying these various theories stated that at present the most acceptable hypothesis is the concept of the existence in the skin of zones of increased irritability (fragile zones) probably determined congenitally by various factors.

Concomitant and histopathologic findings permit the differentiation of linear lichen planus from nevus unius lateralis, linear psoriasis, and lichen striatus. The latter presents as a linear, lichenoid, papular eruption occurring as a rule in children unilaterally on an upper extremity.

In an excellent paper, Senear and Caro³⁴ recently discussed this condition and stated that it warranted a place as a distinct entity. The onset is usually sudden and involution with or without therapy is the rule within a few weeks to several months. The histologic picture is that of a chronic lichenified dermatitis rather than of lichen planus or psoriasis.

Hypertrophic (Verrucous) Lichen Planus.—

This is the most common of all the special varieties of lichen planus. Hypertrophic lesions occur most frequently on the lower extremities, occasionally the upper, in cases of long standing in which the papules have lost many of their ordinary characteristics and have formed thickened, warty, elevated plaques. Such patches may be rounded, elongated or irregular and are reddish-brown or purple in color. The surface is scaly, rough and verrucous and may be excoriated since the accompanying pruritus is usually intense. Areas of pigmentation may be interspersed between the hypertrophic plaques. The term lichen planus obtusus has been applied to a type of the disease characterized by round or oval, flat or convex, rough, warty papules of large size (pea to bean or larger) occurring chiefly on the extremities with or without ordinary lesions.

Cases of lichen planus in which the palms and soles are involved may present lesions which resemble verrucae and which are usually yellow in color rather than violaceous. In most cases the palms and soles are affected as part of a generalized eruption but in certain cases, such as that of Weber and Rattner,³⁹ the lesions may be limited to those areas.

Lieberthal,²⁰ in 1916, described another unusual form of hypertrophic lichen planus which he called the shin-guard type or lichen planus ocreiformis. In this case there were pinhead to bean sized, angular, flat and convex firm papules on both tibial regions. Some of the yellowish-brown lesions were smooth while others were rough and scaly. The plaque in its entirety resembled a "cobblestone pavement." There were lesions on the mucosa of the cheek which suggested lichen planus and the histopathologic findings fitted such a diagnosis.

Vesicular and Bullous Lichen Planus.—

Vesicles at the tops of the papules as well as bullae occur in some cases of lichen planus. In 1933 Strauss³⁶ found seventy-eight examples of

this type in the literature and reported three of his own cases. The vesicles varied in size from that of a pinhead to a hen's egg and from 1 to 200 in number. A relationship to the age of the patient could not be established. In six cases vesicles preceded the typical papular manifestations of the disease. Through the courtesy of Dr. Henry Michelson I recently observed a female, aged thirty-three, whose first lesions were multiple bullae 1 to 2 cm. in diameter arising from a noninflammatory base. The eruption was generalized, although the mucosae were unaffected. At the beginning the eruption was regarded as that of pemphigus but within a few weeks typical lichen planus papules were noted as the bullae disappeared.

Vesicles and bullae in lichen planus may occur on any area including the mucosae, although they are more frequent on the dependent lower extremities. It has been stated that this type of the disease is more common in patients who have taken arsenic. Strauss, however, cited many cases in patients who had never received such medication. Eosinophilia was present in 10 per cent of the eighty-one cases and Nikolsky's sign was positive in two.

Although lichen planus is usually dry on the surface, edema is a distinctive and early characteristic of the pathologic process. An unusual amount of edema in certain cases offers an explanation of the vesicular and bullous types of the disease.

Lichen Ruber Moniliformis.—(Morbus Moniliformis Lichenoides—Wise and Rein) Until the paper by Wise and Rein⁴¹ on this subject in 1936, it was generally believed that lichen ruber moniliformis was a variety of lichen planus. This dermatosis was originally described by Kaposi in 1886 and up to 1936 sixteen additional cases were reported under the same title. The outstanding feature of Kaposi's case was a striking and bizarre arrangement of waxy papules, nodules and keloid-like elongated strands forming parallel ridges chiefly in the neck and flexor surfaces of the arms and legs and disposed in conspicuous vertical rows corresponding to the long axes of the neck and extremities. The eruption resembled strings of pearls or coral beads. Many vertical linear lesions were also present on the abdomen, back and buttocks and there were papules in retiform arrangement on the thighs.

In other areas such as the chest, abdomen and back, there were numerous small, firm, slightly elevated, glistening brownish-red papules some of which were depressed centrally. Pigmented spots were interspersed among the papules. There were no excoriations. Although the genitals were free, flat papular lesions were seen on the labial mucosa and there was an adherent grayish-yellow membrane on the buccal mucosa.

Following a thorough study of the literature and their own case, Wise and Rein concluded that lichen ruber moniliformis was entirely unrelated to lichen planus. In many biopsies there were no changes which would lead one to link the pathologic picture with that disease.

Lichen planus of the Eyelids.—A review of the voluminous literature on lichen planus indicates that lesions on the eyelids are extremely rare. In 1938 Michelson and I²⁶ reported five such cases. We observed three types of lesions on the lids: (1) the ordinary lilac colored, slightly delled, shiny papules; (2) papules arranged to form annular lesions such as are frequently seen on the glans penis; and (3) sepia brown, retiform pigmentation simulating erythema ab igne and similar to the melanotic staining seen in certain patients with lichen planus in the late stages of regression. In one case of this type the histopathologic findings were characteristic for lichen planus. Lesions on the lids may or may not be accompanied by efflorescences on other parts of the body.

Lichen Planus of the Nails.—Involvement of the nails in lichen planus is rare. Pardo-Costello³² stated that, in extensive cases of the disease and in chronic types involving the extremities, paronychias, dystrophies similar to those found in other dermatoses and transverse or longitudinal striations may be seen. As a rule all of the nails are not affected. Little²¹ described pitting of the nails in lichen planus similar to that found in psoriasis, as well as longitudinal flutings. Lewis and Ricchiuti¹⁹ recently described a case of lichen planus of the nail bed and reviewed seven others in the literature affecting one or several nails. Their patient had lichen planus on the legs, arms and glans penis. Later a violaceous papule appeared on the nail bed of the left thumb within the lunula and grew to occupy about a third of the nail. The

nail plate over it became thinned, and that portion of the plate distal to the lesion showed longitudinal striæ. The lesion responded to x-rays. The author mentioned roughness of the nails, subungual hyperkeratosis, thickening, thinning, brittleness or fragility, yellow or yellowish-gray color, opacity and shedding as occurring in lichen planus. Koilyonychia has been noted following lichen planus. Although Heller¹⁴ believed that thickening, increased fragility, yellowishness and opaqueness are characteristic nail changes in lichen planus, Lewis and Ricchiuti agreed with Jadassohn¹⁸ that such dystrophic changes are purely coincidental in many instances and not pathognomonic for that disease.

Lichen Planus Erythematosus.—This unusual type of lichen planus was originally described by Crocker⁷ and later discussed by Freeman¹² in 1926. The lesions are a deep crimson, soft to the touch, and can be temporarily obliterated by pressure. In one of Crocker's cases the eruption was limited to the grain and abdomen while Freeman's case presented soft, smooth, cherry to violaceous colored papules arranged in a retiform manner resembling cutis marmorata on the flexor aspects of the forearms. The histologic picture was that of lichen planus with epidermal atrophy.

Follicular Lichen Planus and Lichen Planus et Acuminatus Atrophicans.—Follicular lesions in lichen planus may occur on the trunk or extremities in conjunction with the ordinary flat-topped papules. The follicular lesions are usually brown or yellowish-brown in color, non-inflammatory, horny, acuminate, and impart a "nutmeg grater" feel to the affected skin. When acuminate papules occur with typical lesions of lichen planus the diagnosis is not difficult but in the absence of these an eruption of horny, acuminate papules offers great difficulties in diagnosis, since keratosis pilaris, keratosis, follicularis, phrynodema and pityriasis rubra pilaris come into consideration. Lichen planopilaris³¹ is the term which Pringle applied to this form of lichen planus in which the ordinary lesions are accompanied or followed by an eruption of follicular papules indistinguishable from those of lichen spinulosis. Adamson,¹ in his classic description of lichen spinulosis, defined that disease as one occurring chiefly in children, and characterized by horny,

filiform papules distributed symmetrically over the trunk and extremities, said that its occurrence in an adult means lichen planus.

Combes and Bluefarb⁵ recently reported an example of a follicular type of lichen planus which they termed "lichen planus follicularis circumscriptus." The lesions occurred in well marginated patches on the arms, thighs, and legs and were made up of miliary red papules which under magnification were follicular, angular, scaly and nonconfluent. The sites of previous lesions were marked by a well-defined, milk-white area of atrophy 2 to 5 mm. in diameter. There was neither pigmentation, follicular plugging nor punctate pitting. Histologic examination showed the picture of lichen planus with atrophy.

In 1922 Feldman¹⁰ reported a case under the title of lichen planus et acuminatus atrophicans. The patient was a forty-five-year-old woman who had lesions of lichen planus on the arms, face, neck and trunk which left brown, pigmented areas after involution. These areas later became depigmented and atrophic. Interspersed among the ordinary lesions of lichen planus were hemispherical, pink or red, acuminate papules each having a yellowish-brown to almost black horny plug. Cases similar to Feldman's had been previously reported as "folliculitis decalvans et atrophicans" or "folliculitis decalvans et lichen spinulosus" by Little, Dore, Beatty and Ormsby. These cases differed from Feldman's to the extent that there were no typical papules of lichen planus and the patients showed areas of alopecia and atrophy on the scalp. There were, however, no follicular pustules on the scalp, a finding which is essential for a diagnosis of folliculitis decalvans according to Quinquaud, who originally described that disease. Ormsby's patient showed an atrophic area in front of the left ear similar to the lesions on the scalp. Since the ear region is nonhairy the atrophy could not be accounted for on the basis of folliculitis decalvans. In 1921, Little presented a case in which there were atrophic areas on the scalp, lichen spinulosus-like lesions on the body and a scattering or ordinary lichen planus papules on the body and lesions on the tongue and buccal mucosa which were variously diagnosed as lichen planus or leukoplakia. In 1936¹⁰ Feldman reported two more cases, each of which had atrophic, bald patches on the scalp, discrete and grouped, acuminate, follicular, plugged papules on the body

as well as unmistakable lesions of lichen planus. Feldman felt that this syndrome in its entirety should be considered as a type of atrophic lichen planus rather than folliculitis decalvans plus lichen spinulosus. For further details reference may be made to Feldman's publications and a recent article on the subject by Ellis and Kirby-Smith.⁹

Atrophic Lichen Planus; Lichen Sclerosus et Atrophicus.—Perhaps the most confused aspect of lichen planus is its possible relationship to lichen sclerosus et atrophicus. The entire subject of atrophic lichen planus, lichen sclerosus et atrophicus, lichenoid scleroderma, and kraurosis vulvæ is viewed differently by leading dermatologists at the present time. It is not within the scope of this paper to go into these differences of opinion in detail and reference to the subject may be made from other sources such as the papers by Nomland²⁹ and Montgomery and Hill.²⁸

In brief, most observers agree that lichen sclerosus et atrophicus, lichen albus of von Zumbusch and chronic atrophic lichenoid dermatitis of Csillag are the same disease. Furthermore, there is little question that lichenoid or guttate types of morphea exist which can be distinguished histologically at least from lichen sclerosus et atrophicus. The moot point is whether or not lichen sclerosus et atrophicus is a form of atrophic lichen planus. It is my present belief that Nomland and Montgomery and Hill are correct in their opinion that lichen sclerosus et atrophicus is a distinct entity and can be distinguished in most cases clinically and especially pathologically from atrophic lichen planus on the one hand and morphea guttata on the other.

The characteristic lesion of lichen sclerosus et atrophicus is an irregular, often polygonal flat topped papule, presenting an ivory or mother-of-pearl color which is striking. The papules may be discrete, or coalesce to form plaques, but in most cases both types of lesions are present. Delling and follicular plugging is regarded as an important diagnostic aid. When the lesions occur on the female genitals they coalesce to form plaques which simulate kraurosis vulvæ. According to Montgomery and Hill the atrophic lesions in kraurosis vulvæ do not extend beyond the inner aspects of the labia majora and merge gradually with the normal skin while the sharply defined plaques of lichen sclerosus et atrophicus

icus extend onto the thighs and perianal region. The individual papules may be seen in lichen sclerosus et atrophicus. The diagnosis of the latter disease depends upon the recognition of these typical white papules together with correlation with histopathologic observations. Hunt²⁶ in discussing the subject linked kraurosis vulvæ with lichen sclerosus et atrophicus, associating both with atrophic lichen planus. I do not share this view.

True atrophic lichen planus is extremely uncommon. A good example of this type of the disease was the case which Nomland²⁹ reported in 1930. The eruption involved the scalp, face, arms, legs, and body. Most of the lesions were from 0.5 to 1.5 cm. in diameter and appeared as brown, atrophic, finely wrinkled, depressed macules, many of which had a narrow elevated violaceous shiny margin. There were a few typical papules of lichen planus on the skin and white lines and dots in the mouth. There was an atrophic bald area without pigmentation on the scalp.

Montgomery believes that even though atrophic forms of lichen planus may simulate lichen sclerosus et atrophicus, other more characteristic lesions of lichen planus are usually found on the skin or musosæ. Dermatologists whom I have questioned cannot recall seeing typical lesions of lichen planus together with the ivory-white lesions of lichen sclerosus in which adequate histopathologic studies were done. Montgomery, however, has seen cases of atrophic lichen planus which somewhat resembled lichen sclerosus clinically but which histologically were lichen planus.

Lichen Planus-Like Drug Eruptions.—From time to time eruptions closely simulating or indistinguishable from lichen planus have been observed following injections of the arsphenamines or gold salts. In 1921 Buschke and Freymann⁴ reported two cases of lichen planus-like eruptions occurring after arsphenamine therapy. In one, the clinical features were those of lichen planus while the histopathologic findings were nonspecific and in the second the reverse was true. McCafferty²⁴ and Ahlswede² wrote articles on the subject in the American literature. McCafferty's case, which occurred during antisymphilitic therapy, was completely indistinguishable clinically and histologically from true lichen planus. There were typical lesions of lichen planus in the mouth.

Similar cases following gold therapy are exemplified by those of Pautrier and Roederer³³ and Traub.³⁸ The case of Pautrier and Roederer showed an admixture of ordinary and verrucous lesions of lichen planus. There was also involvement of the buccal mucosa. Traub's patient had lichen planus eight years previously but had recovered and remained well until she received gold therapy for arthritis. After two or three injections a generalized eruption appeared which was said to be rather typical of lichen planus both clinically and histologically.

Those who have discussed this topic have considered the following three possibilities:

1. The eruptions following arsphenamine and gold are true lichen planus and appear purely coincidentally.
2. The eruptions are true dermatitis medicamentosa merely simulating lichen planus.
3. The eruptions are true lichen planus, a disease which can be precipitated by diverse factors including drugs.

Ahlswede stressed the constitution or disposition of the patient and felt that drugs could act as a trigger mechanism to provoke lichen planus in a specially reactive type of skin. He compared such an occurrence to "seborrheic-like" syphilitic eruptions occurring in individuals with an oily skin. In discussion of Traub's case Sachs expressed a similar opinion. Peck, however, stated that Satenstein believed that lichen planus-like eruptions due to drugs could be differentiated from true lichen planus because of the increased depth of the infiltrate in the former. The question of coincidence is also raised by Traub's case since the patient had an attack of lichen planus previously. Further study of these eruptions is necessary before final conclusions can be drawn. The important point is that lesions identical to those of ordinary lichen planus can appear following the injection of the arsphenamines or gold salts.

Histopathology

Lichen planus presents a characteristic histologic picture consisting of an increase in the stratum corneum and stratum granulosum with varying degree of acanthosis. There is pronounced vacuolization and necrosis of the basal cell layer and a dense lymphocytic infiltrate in the upper

portions of the cutis. According to Nomland²⁹ and to Montgomery and Hill²⁸ this infiltrate persists even in the atrophic forms when the epidermis becomes decidedly thinned. The findings in lichen planus of mucous membranes is similar to that of lesions on the skin.

In vesicular and bullous lichen planus the vesicles or bullæ are usually subepidermal but may be intradermal. Subepidermal spaces were considered by Joseph as a distinctive characteristic of lichen planus and are frequently seen in microscopic sections even when there is no macroscopic vesiculation. These lacunæ are the result of a tearing-away process of the lower portion of the rete by edema. In fact there may be total liquefaction degeneration of cells in this area leaving epithelial chasms. In vesicular cases this process is apparently intensified and an outpouring of serum results in the formation of bullæ. Subepidermal lacunæ are more common which parallels the occurrence of real vesicles in this location.

In well-developed lichen sclerosus et atrophicus the histologic picture does not resemble that of lichen planus. In the former there is hyperkeratosis with hyperkeratotic plugging of the follicles, and atrophy of the rest of the epidermis with flattening and loss of the rete ridges. In the upper portion of the cutis there is a clear-cut zone of homogenization. Directly beneath this zone there is an infiltrate of varying degree which may in certain cases appear in a band-like formation. Darier assumed that in lichen sclerosus the original infiltrate characteristic of lichen planus had disappeared leaving behind sclerosis and atrophy. Montgomery and Hill,¹⁶ however, disagreed with this and could find no changes consistent with a diagnosis of lichen planus even in sections from the earliest lesions of lichen sclerosus et atrophicus.

Treatment

The statement that the more cases of lichen planus which one treats the less he knows concerning the preferable treatment has been made by many dermatologists. Certain cases prove difficult to manage despite the use of all modern therapeutic measures, including x-ray therapy fortified with arsenical, mercurial and bismuth salts. Since we lack knowledge of the cause of lichen planus treatment is necessarily empiric.

In discussions concerning therapy mention is frequently made of a general régime consisting of regulated physical rest, relaxation of endeavor, changes of environment and respite from worries and uncertainties. The urgency for these measures of course depends upon the neuro-psychic state of the individual patient but by most patients who are being treated in the office such advice is as a rule followed in a half-hearted, slipshod manner.

Ordinary bathing can be carried out as desired since it usually does not aggravate the disease. Soothing, tepid, colloid baths, employing corn starch, soda or oatmeal gruel, are helpful in some cases of widespread lichen planus characterized by intense pruritus.

No undisputed facts are known concerning the diet in lichen planus although some authors advise the exclusion of alcohol, tea, coffee, spices, fats, and oils. In my own practice I do not carry out any dietary regulation.

Burgess³ recently reported favorable results in the treatment of fifteen cases of lichen planus with vitamin B complex. In his series the response was especially good in acute cases, the medication exerting at times what he termed an almost specific effect. The response was much slower in chronic and hypertrophic varieties. Attempts to ascertain the possible value of individual constituents of the B complex did not show any therapeutic specificity and Burgess felt that the entire complex should be used in the treatment of lichen planus.

Opinions vary greatly as to the relative merits of arsenic mercury and bismuth. Oppenheim³⁰ believes that arsenic is most effective, Little preferred enesol (a combination of arsenic and mercury), Sonck praised bismuth, while Toomey³⁷ stated that mercury is the "sheet anchor" in the treatment.

The latter believed that arsenic was contraindicated in acute lichen planus and that arsenical preparations given by injection (sodium cacodylate) had no therapeutic advantage over those given by mouth (Fowler's solution). He advised Fowler's solution in doses of 2 or 3 drops twice daily, increasing according to tolerance to not more than 12 drops daily. The drug was to be administered in courses as follows: first course three to four weeks with a rest period of five to ten days; second course two to three weeks with a rest period of two weeks; third

course two weeks. The solution was not to be given more than three months out of every ten-to-twelve-month period.

Oppenheim praises sodium cacodylate, administering the drug daily in acute cases in doses of 0.2 gm. intramuscularly up to thirty injections. If the patient complains of tasting or smelling garlic the medication is discontinued. In chronic cases Oppenheim prefers Fowler's solution or Asiatic pills.

Huffs Schmidt stated that fairly good results were obtained in the cutaneous but not the mucosal lesions of lichen planus by means of stovarsol. There were occasional flare-ups following the drug and there seemed to be no protection against recurrences. Stovarsol may be administered in the following way: 0.25 gm. tablets are given on an empty stomach one-half hour before breakfast. As many tablets are given in a course as the patient weighs in kilograms.

From a study of twenty-five cases, Conrad, Conrad, Mapother and Weiss⁶ recently recommended bismuth arsphenamine sulfonate (bismarsen) in the treatment of lichen planus and suggested that it might be especially useful in those cases with mucous membrane involvement. The drug was given intramuscularly in doses of 0.1 gm. twice weekly along with large doses of vitamin C. There were three cases of stomatitis, several cases of puffiness of the eyelids and three cutaneous reactions to the arsenical in the series. Some patients were improved after five or six injections and apparently cured after fifteen or twenty injections while in the more chronic cases the number of injections had to be increased.

The arsphenamines have been employed by a number of dermatologists with indifferent results. Due to their toxicity they should not be used routinely in lichen planus.

Sonck³⁵ was favorably impressed with bismuth in lichen planus stating that it was cheaper than arsphenamine, more convenient and safer. Improvement sometimes appears slowly and some cases prove resistant. Sonck presented the following statistics concerning comparative treatments for lichen planus:

	No. of pts.	Recovered	Improved	No result
X-rays	73	42.5	35.4	21.9
Bismuth	29	38	41.4	20.7
Arsphenamine	17	29.4	41.2	29.4

Without doubt discussion concerning the relative merits of irradiation, mercury, arsenic and bismuth will continue for a long time.

Most authors praise mercury although there is wide divergence of opinion concerning the most useful preparation. It is quite well agreed that the mercurials are better given by injection than by mouth since by the latter route they are more uncertain, less efficient and sometimes irritating to the gastro-intestinal tract. Toomey thought that the best results were obtained when patients were treated just short of thorough mercurialization. It was also his opinion that the insoluble mercury salicylate in oil was preferable to the soluble salts such as mercury bichloride or cyanide. There is considerable difference of opinion on this point however. Bichloride of mercury is usually given daily in doses of 1/12 grain, and the salicylate once or twice weekly in doses of 1.5 grains. The salicylate is prepared as a 10 per cent suspension in a nonmineral oil. Little²¹ favored mercury salicyl arsenate (enesol) giving 2 c.c. of the drug intramuscularly every second day over a period of six weeks.

Toomey³⁷ noted that in some cases ultraviolet irradiation seemed to hasten the resorption of the lesions. Oppenheim also feels that such treatment is of value.

Although x-rays are widely used in the treatment of lichen planus and must be regarded as one of our most useful therapeutic agents, the response varies in individual cases and patients are frequently encountered whose eruptions have failed to respond to proper safe doses. In some instances, even after certain lesions have begun to involute following irradiation, new lesions continue to appear during active therapy. In general the acute and subacute varieties of lichen planus involute within six to twelve weeks of fractional x-ray therapy. Hypertrophic plaques are notably resistant to x-rays as well as other types of treatment. Paravertebral roentgen therapy has also been used in the treatment of lichen planus. For details reference may be made to MacKee's textbook.

Radium is less useful than x-rays but is sometimes of value especially in mucosal lesions.

Three other physical therapeutic agents merit mention in the treatment of hypertrophic plaques: solid carbon dioxide, the actual cautery and electrodesiccation. Such agents are worthy

of trial when other measures have failed to produce a satisfactory result.

Local applications do little more than help relieve pruritus. I usually employ an antipruritic lotion containing 0.5 per cent camphor, 1 per cent phenol and 2 to 10 per cent liquor carbonis detergens.

In summary it may be repeated that lichen planus is a difficult disease to treat and that the wide divergence of opinion concerning the relative merits of various therapeutic agents signifies that no one or combination is entirely satisfactory.

INFECTIOUS MONONUCLEOSIS

JOSEPH M. RYAN, M.D.

Saint Paul, Minnesota

IN 1927, Davidsohn found that the serum of individuals who had serum disease contained a high titer of anti-sheep red cell agglutinins and hemolysins. Paul and Bunnell, in checking his results a few years later, discovered that four of their patients afflicted with infectious mononucleosis also showed the same reaction. Later Bunnell demonstrated the presence of a high titer of agglutinins for sheep erythrocytes in fifteen

cases of infectious mononucleosis, and in twenty-two cases of serum disease.

The blood serum of many normal individuals will clump sheep erythrocytes, but only in very low dilutions. This particular ability of normal serum is accentuated after the injection of horse serum because of an increase in the amount of hemolysins and agglutinins. Thus these antibodies are reacting with an antigen (sheep erythrocytes) which had no part in stimulating their development. They are therefore called

Presented before the Minnesota Society of Internal Medicine at Duluth, May 23, 1942.

heterophilic antibodies. Some heterophilic antibodies may be specifically removed from human or animal serum by an extraction process in which the tissues of various animals (guinea pig, horse, chicken and others) are used. This group of antibodies are those found in the serum of individuals having serum sickness, while those of the patient having infectious mononucleosis which do not show the same extractable characteristic, fall into another group. This distinguishable characteristic affords an important diagnostic laboratory procedure in dealing with infectious mononucleosis.

Another and equally important diagnostic aid in dealing with infectious mononucleosis is the proper study of serial blood smears. Characteristic monocytes as described by Downey and McKinley occur fairly early in the disease. An experienced hematologist who recognizes this "atypical monocyte" contributes greatly in arriving at the diagnosis of infectious mononucleosis.

Thus we have two very important and essential means of making the diagnosis of this condition, in the laboratory. Which is of the greater importance cannot be stated, but it can be said that both should be used. The clinical means of diagnosis is altogether too uncertain because of the protean manifestations of the disease.

The following case is an example of one in which the diagnosis was made first by the hematological picture and was later confirmed by the serological findings. The latter test was of no help early in the disease as it showed a negative response.

Case Report

A housewife, twenty-five years of age, was admitted to the hospital on November 11, 1941. She first became ill two evenings before, when she began to have chills, aches, and pains, associated with marked fatigue. On the following day her temperature was 101. During the next two days and nights she continued to have an intermittent fever which was worse in the mornings. She became very nauseated, but had severe, "hunger pains."

Physical examination showed a well-developed and well-nourished white female who was lying in bed, but appeared to be very uncomfortable whenever she tried to move. The conjunctivæ had a slight yellowish tinge. There was a moderate injection of the pharynx and the tonsils had been removed previously. The lymph nodes in the posterior cervical region were palpable and very tender. A systolic murmur at the apex of the heart was found, but was not transmitted. The heart was not enlarged. The heart rate was 100, and the blood pressure 102/48.

There was slight tenderness to pressure in the right upper quadrant of the abdomen just to the right of the epigastrium. The lower portion of the liver was not palpable.

The neurological examination was negative.

Hospital Course.—The patient was very ill for three weeks. Each night the temperature rose to 102 to 103 degrees and dropped to normal early in the morning. Chills and sweats followed each temperature elevation and these were followed by a period of marked prostration.

On November 15 the liver was found to be enlarged. The lower border was palpated 3 cm. below the costal margin.

Each afternoon she complained of a severe frontal headache which was relieved by ten grains of aspirin.

At the end of the first week of hospitalization a dry persistent cough occurred. This lasted until the third week of illness.

The spleen was palpable on November 20. The patient was not able to take fluids or food because of nausea. Five per cent dextrose solution in normal saline was given daily for seven days.

On December 6, the temperature remained at a normal level and a very rapid convalescence started. She was discharged from the hospital on December 9.

The treatment was entirely symptomatic. Vitamin B complex was given intramuscularly during the period of vomiting and dehydration.

Laboratory.—Blood culture, Wassermann, stool cultures, Mantoux, agglutination tests for typhoid and melintensis were all negative. The sedimentation rate was 21 mm. The throat culture was positive for *Streptococcus viridans*. Roentgenogram of the chest was normal.

The blood study and leukocyte counts are summarized in the accompanying table. This table also indicates the heterophile titer on two occasions.

Day	W.B.C.	Neut.	Lymphocytes	Monocytes	Atypical Monocyte	Heterophile Titer
1	8,200	54%	29%	13%	0%	1-8
2	5,150	47	28	20	1	
3	6,000	47	36	14	0	
4	5,700	55	35	8	0	
5	6,750	40	39	12	0	
6	9,250	44	39	13	0	
8	13,700	22	17	4	54	
12	7,450	17	20	2	59	1-128
18	8,400	17	58	2	23	

Comment

This case was a diagnostic problem throughout the first two weeks of the illness. The symptoms, both objective and subjective, resembled those of endocarditis, typhoid, undulant fever, acute cholecystitis and infectious mononucleosis. The heterophile negativity during the first week clouded the picture considerably. Until the appearance of the atypical monocyte in large numbers, considerable confusion as to the proper handling of the case existed.

Conclusion

1. A negative heterophile reaction should not eliminate the diagnosis of infectious mononucleosis early in the course of the illness.
2. The hematological findings were of the utmost importance in this case.
3. One should bear in mind that jaundice often occurs in this disease. Perhaps some individuals who have a transient mild attack of jaundice are unrecognized cases of infectious mononucleosis.

4. The correct diagnosis will prevent much unnecessary treatment.

MYASTHENIA GRAVIS

G. M. CONSTANS, M.D. and R. B. RADL, M.D.

Bismarck, North Dakota

IN reporting on this interesting, though not uncommon, condition we are confronted with the relatively few cases reported and the paucity of material upon the subject that appears in medical texts. Since Wilkes, in 1877, first reported this syndrome, about three hundred cases have been reported. In books, both on general medicine and on ophthalmology, from one to three paragraphs are usually given to this disease.

The purpose of the authors of this paper is to bring the attention of practicing physicians to this disease and to a diagnostic aid which seems to be quite specific. We will also discuss the therapy of the disease without going too much into detail as to its physiology and pathology.

The word myasthenia gravis means "severe muscular weakness." Jolly, in 1895, described the syndrome as a weakness fatigue and sometimes actual wasting of the muscles without any pathologic changes that were demonstrable microscopically. In patients suffering from this disease, repetition of movement quickly induces fatigue. While any of the voluntary muscles of the body may be affected, it tends to affect the muscles which are used most commonly and one might also say the voluntary muscles which are used involuntarily. We refer to the extraocular muscles, the muscles of the face, and the muscles of deglutition and speaking. Most often the manifestations appear in the third and fourth decades of life, though in our series they appeared in the

age period from twenty-one to sixty-seven. In older people the symptoms are sometimes diagnosed as a "stroke." When seen in the younger age group, the disease is usually more severe. The exact etiology is not known. Various authors ascribe it to the persistence, hyperplasia or even a tumor of the thymus. Others feel that the disease may possibly be of nervous origin, or that the fatigability is due to faulty metabolism of the muscle cells.

The diagnosis is always spoken of as easily made and possibly this is so, but it is also often passed over, for there may be remissions of the symptoms and thus the diagnosis is missed. Most of the early symptoms are referable to the eye and jaws. These patients, often first seen by the general practitioner or internist, are frequently referred to the ophthalmologist because of this condition. He must be alert to recognize the disease. Some of these unfortunate people have had numerous refractions with no benefit because their disease, myasthenia gravis, was unrecognized.

A history of cold or grippe, as noted in our cases No. 9 and No. 14, sometimes precedes the onset of symptoms or aggravates the same, although this may be forgotten by the patient.

The relationship of myasthenia gravis to pregnancy is one of interest, and was discussed by Viets, Schwab and Brazier²² in a recent article. Our case reports No. 8 and No. 13 are extremely interesting, both as to the occurrence or the increase in symptoms following delivery.

From the Department of Ophthalmology and the Department of Internal Medicine, Quain and Ramstad Clinic.

To properly treat these patients an early diagnosis must be made. The disease is progressive and, though characterized by remissions, may terminate fatally.

Inasmuch as the cranial nerves supplying the muscle groups are most often affected first, the resultant symptoms are here presented. Two groups of symptoms are noted: (1) the ocular; and (2) those referable to other muscles or muscle groups. Among the first symptoms is diplopia. It has been estimated to be present as the earliest symptom in 50 per cent of the cases (in our series, 80 per cent). This is confusing to the patient and sends him to the oculist. The cause is a weakness or partial paresis of the extra-ocular muscles. This weakness is acknowledged to be due to neuromotor dysfunction and not a contracted state of the musculature.

Abrahams¹ found in this type of diplopia an irregularity in the amount and quality of heterophoria, transient in nature, an irregularity in induction which was unusually high, and a closeness of the images. He does not think it should be called myasthenia, that is, a true muscle weakness. These transient tropias or drifting phorias are relieved by prostigmine in some cases. Such symptoms are not found in other conditions and hence are of definite diagnostic value.

With the presence of these symptoms, however, there is usually no change in the visual acuity or refractive error, nor is there any change in the pupillary reactions or accommodative power, which are unaffected by prostigmine or other similar therapy.

Ptosis of the upper lids, one or both, is the next most common symptom, and varies in intensity. It is present in about 80 per cent of the cases (in our series about 70 per cent). It can easily be determined by measuring the width of the palpebral fissure with a pocket ruler. In early cases ptosis is not present in the morning, but comes on with fatigue and is overcome in the earlier stages of the disease by rest.

A routine eye examination, taking the vision, tests of forehead movements, refraction and muscle tests, will bring out the diagnostic points. Other than the positive findings given above, tests, such as of the perimetric fields, ophthalmoscopy, etc., reveal normal findings.

The next most common involvement is that of the muscles of mastication. Here, food may lodge in the cheek and the patient easily and

obviously tires upon chewing. In close connection is the weakness of the muscles of deglutition and phonation, so that the patient complains of difficulty in swallowing and has a nasal twang to his speech. Later, it becomes increasingly difficult to talk. In some cases there is weakness of the vocal cords, and in others food is regurgitated and this may be dangerous. Later still, the head may droop and wobble and become unsteady; here you may even see the patient holding up the head or lower jaw with the characteristically sad expression of the face.

In addition to the cranial nerve involvement affecting the muscles just mentioned, there is the second group referable to other muscles or muscle groups. Here practically any voluntary muscles in the body may be affected. For example, it may be very difficult for the patient to comb the hair; the act of lifting food to the mouth in ordinary feeding may be almost impossible to perform. These simple acts become fatiguing work, and it may be extremely difficult for the patient to walk upstairs. General muscular weakness, especially of the arms or legs as in crossing them or stepping up, comes on later.

One of the most serious symptoms is dyspnea as a result of fatigue of the respiratory muscles which may, if progressive, become fatal.

The characteristic and outstanding symptom of myasthenia gravis is the variation in degree of the muscular weakness from day to day and especially at different times of the day. An extremely important lead is the statement that the patient feels best when arising and rapidly fatigues as the morning goes on and that the symptoms gradually become worse with slight fluctuations during the day. Only the motor system is involved as is shown by the total absence of sensory symptoms and findings.

The diseases and pathologic conditions which are most likely to cause confusion and error in the diagnosis of myasthenia gravis are post-encephalitic parkinsonism, chronic nervous exhaustion, progressive muscular dystrophy, progressive muscular atrophy, psychoneurosis, poliomyelitis, cranial nerve paresis (whatever the underlying pathology), pernicious anemia, multiple sclerosis and central nervous system syphilis. However, such confusion should not persist for long as the findings and course of the disease are typical. Some of our cases illustrate the similarity of symptoms and the difficulty of diagnosis. All of

this first group were examined prior to the advent of the prostigmine test which, when used, simplifies the diagnosis, as will be noted later.

Case 1.—Mrs. J. P., a housewife, aged forty-six, was first seen in 1917 and many times thereafter with minor ailments and numerous operations. Menopause started in 1928, when she also had an attack of herpes zoster and neurosis. She complained of loss of strength in the legs and marked general weakness. This gradually improved, but later she had difficulty in swallowing and a feeling of swelling in the throat. A tentative diagnosis of globus hystericus was made. During the next year there was gradual loss of weight, progressive general weakness and homonymous diplopia. The blood Wassermann test was negative. A year later a partial paresis of the left external rectus muscle occurred with general weakness and psychoneurosis. There was a mild refractive error and presbyopia was present with poor convergence, but the vision, perimetric fields, fundi and Baranay tests were negative. Diagnoses of Parkinson's Syndrome, chronic nervous exhaustion, multiple sclerosis, syphilis and myasthenia gravis were considered. Progressive failure occurred and the spinal fluid showed a positive Wassermann. The patient died on March 18, 1938 with a diagnosis of central nervous system lues and cerebral tumor, which was confirmed by autopsy.

This case illustrates the difficulty sometimes encountered in the differential diagnosis and the fact that syphilis may simulate myasthenia gravis, particularly when progressive weakness, diplopia and dysphagia are present.

Case 2.—Mrs. J. A. H., a housewife, aged twenty-three, was referred to the Clinic, November 30, 1936.

She had had nystagmus and diplopia with a history of previous sixth nerve palsy. There was slight ptosis of the upper lids and a crossed diplopia present. General weakness and difficulty in walking were noted. The fields showed superior quadrant defects, enlarged blind spots and absolute central scotomata. There was partial third, sixth and seventh nerve paralysis of the left eye and poor vision. A diagnosis of multiple sclerosis was made and she was placed on typhoid shock therapy.

Two years later she was improved, although she had had one remission. She was last seen two years ago and there was slight ptosis and nystagmus, also definite contraction of the color field and cæco-central scotomata continuous with the blind spots, and temporal pallor of the discs. The diagnosis was multiple sclerosis.

The differentiation between myasthenia gravis and multiple sclerosis is often confusing as illustrated above. Both may have ptosis, diplopia and weakness and be characterized by remissions. The neurologic signs, such as nystagmus, scanning speech and intention tremor, and fields and fundus changes are most characteristic of multiple sclerosis, though they too may at times be absent.

Case 3.—Mrs. G. P., a housewife, aged thirty-nine, was first seen on December 20, 1936.

Her complaint was diplopia which had been present for two weeks. She gave a history of one attack five years before; she then improved but now had a gradually developing general weakness. Blood and spinal fluid Wassermann tests were negative. The physical examination was negative except for absence of the superficial abdominal reflex on the left side.

She was seen five years later. She had marked ptosis of the eyelids, extra-ocular muscle paresis, normal vision, but the fields were contracted and there were enlarged blind spots. Diagnostic impressions were myasthenia gravis, multiple sclerosis or bulbar lesion. Provocative tests were made, but were not conclusive. There was a possibility of myasthenia gravis, although a central nervous system lesion seemed more probable.

Lesions of the central nervous system, such as bulbar palsies, encephalitis, and basal pachymeningitis are also confusing, but the progressiveness and permanency of their findings, the definite neurologic changes and the absence of reaction to the diagnostic test largely rule out myasthenia gravis.

The diagnosis of myasthenia gravis is important. There is a definite treatment which is of great value and in all fairness to the patient, myasthenia gravis should not be considered a hopeless disease. In order to diagnose the disease one must always remember the possibility of its existence in patients complaining of symptoms and signs of the type and nature which we are attempting to bring out in this paper. A complete and accurate history and examination with special emphasis on the neurologic examination are of the greatest importance. In 1935, Viets and Schwab proposed the use of prostigmine as a test for myasthenia gravis. Their initial report has been amplified by them several times. We believe the test is of so much value that we are incorporating the actual procedure into this article. There are other tests, such as the electromyographic and ergographic studies, which require special apparatus and are not available to the general practitioner. The prostigmine test can be used by anyone who uses ordinary care.

The prostigmine test as used by us consists of the use of prostigmine methylsulfate and atropine sulfate. It is prepared by Hoffmann-La Roche, Inc., so that 1 c.c. of the diagnostic material contains 1/40 grain (1.5 mg.) of prostigmine methylsulfate and atropine sulfate 1/100 grain (0.6 mg.). The diagnostic test chart whereby objective improvement and subjective improvement are

noted at intervals of ten minutes is a convenient and quite accurate method of determining response to the material injected. The publications by Viets and Schwab¹⁷ and the directions in the test set as made up by Hoffmann-La Roche, Inc. make the test one of comparative simplicity which can be used in the office or hospital by any physician. We have found it of equal value, both in determining the presence of myasthenia gravis and also in ruling it out.

Due to the marked change in symptoms of patients with myasthenia gravis after the prostigmine injection, some observers feel that the need of scoring by making several observations is unnecessary. This is true, perhaps, in three-fourths of the myasthenia cases, but in the non-myasthenic group, particularly in chronic patients, suggestion plays a large part and they may score high enough on the subjective symptoms to make a diagnosis of myasthenia possible unless several tests are made. Since the test can be completed in an hour, and since it requires no elaborate apparatus, we feel that the formula here suggested is so simple that any physician can carry it out. We agree with them that the long period of observation formerly used is impractical, and in our clinic it has been found unnecessary.

It is to add to the cases heretofore reported that we present our series with comments that may be of value in both diagnosing and treating subsequent patients encountered with this syndrome.

Case 4.—Mrs. M. M., a housewife, aged twenty-one, was first seen in September 1929.

Three months before she had had twitching of the hands and difficulty in keeping the eyelids open. Later, there was difficulty in the use of the facial muscles and in swallowing and eating. This increased and she reported because of this trouble and also because of trouble with walking. When drinking water, it was regurgitated and often caused coughing.

Upon examination the patient talked indistinctly. There was slight ptosis of the upper eyelids and difficulty in swallowing fluids. Examination of the ear, nose and throat was negative. One week subsequently she developed a pharyngeal paralysis. Spinal puncture and other eye findings were negative. A tentative diagnosis of a toxic bulbar paralysis or myasthenia gravis was made.

The patient was removed from the hospital without consent and no further report was obtained.

This might well have been a case of myasthenia gravis, though, of course, bulbar palsy could not be ruled out due to an insufficient period of observation.

Case 5.—R. N., a retired farmer, aged sixty-four, was seen in August, 1933.

He complained of difficulty in getting out of bed and weakness of the left arm. He had been seen previously since 1923. He had had anorexia, cough and dacryocystitis of the right eye. At this time he had an intention tremor of the hands and limbs, sluggish eye reflexes and slight ptosis of the upper eyelids. The condition remained the same at two subsequent visits. A diagnosis of myasthenia gravis and paralysis agitans was made.

Here it was well to think of myasthenia gravis and not hurriedly call it a stroke.

Case 6.—C. L. B., a farmer, aged thirty-four, was seen in April, 1934.

He complained of difficulty in speech which started in 1930, his tongue tiring and speech becoming thick. Three years previously he had noted that the eyes tired and the lids drooped on reading. Two years ago he had spells of diplopia and of late noted weakness of the extremities on exertion.

Examination revealed a staring expression and thick voice. The general findings were negative except exaggerated cremasteric reflex and knee jerks with an intention tremor of the tongue and hands. A working diagnosis of myasthenia gravis or postencephalitis Parkinsonian Syndrome was made. The patient was not seen again and no further conclusions were reached.

Case 7.—H. S., a male, aged forty-three, a Bertillon expert, was seen in April, 1933.

He reported because of blurred vision and diplopia. He had been seen from time to time from 1921 for other causes including an appendectomy and refraction.

Upon examination a diplopia of the crossed type was present, and the perimetric fields were somewhat contracted and slightly irregular. Except for exaggerated knee jerks, the general examination was negative, as were the blood Kahn and Wassermann. An upper motor nerve lesion was thought of and also encephalitis. One month later he still had diplopia, photophobia and some hoarseness. A central nervous system lesion was ruled out by the neurologist and a diagnosis of myasthenia gravis made.

He was placed on treatment with ephedrine and improved. He used prisms which helped, but he later discarded the same. The general condition improved, but he still had diplopia. He moved away and was not seen again.

This is a case of myasthenia gravis with remissions. All other findings, x-ray examinations, etc., were negative. Inability to follow up this case is regretted.

Case 8.—H. W., a farmer, aged fifty, was seen in December, 1933.

This patient came in because of poor vision in the left eye, headaches and diplopia. Later he was found to be myopic with an amblyopia exanopsia of the left eye. A ptosis of the lid had been present for years. Physically he was more tired than previously, though no definite weakness was made out. Other findings were negative, though glasses improved his vision.

He was placed on ephedrine and the diplopia improved. The diagnosis was myasthenia gravis.

Case 9.—M. D. W., a male teacher, aged forty-seven, consulted the Clinic in December, 1933, because of throat trouble; that is, after speaking he was tired and had difficulty with his speech. Of late he had had trouble with swallowing and eating; food lodged in his cheek. The past history disclosed that this had started six months previously, but he had had transitory diplopia three years before and some ptosis six months before. He had tried glasses and chiropractic treatments with no help. He thought that his present trouble had started with a cold three months before consulting us. At times he had had to hold up his jaw as it became tired.

Examination revealed marked nasal speech and trouble in phonating. There was partial ptosis of the eyelids and diplopia with weakness and inability to turn the eyes to the right. The general physical examination was negative. The spinal fluid was negative as were the vision, visual fields, fundi and refraction except for presbyopia. He definitely improved under ephedrine and glycine treatment. The diagnosis was myasthenia gravis. Here is our first case which apparently followed or was aggravated by a cold.

Case 10.—Mrs. H. J. L., a housewife, aged forty-seven, was seen in October, 1935.

She came in complaining of difficulty in swallowing which was first noticed about four months before, following the delivery of a full-term infant. This had gradually become worse. During the past month she had had very marked difficulty in swallowing. She had been able to swallow only liquids and these only occasionally. About one month previously the dysphagia had become very marked and was accompanied by difficulty in talking, drooping of the upper eyelids and a diplopia. Since her pregnancy she had tired very easily on exertion. For the past two days the right upper eyelid had been much worse, so that she could scarcely open the eye at all without lifting the eyelid with her finger. At no time had she had any pain or any headache.

The past history revealed that this patient was refracted here nine years ago. She had had no complaint previously.

Examination revealed ptosis of the lids, nearly total loss of movement of the extra-ocular muscles with resulting homonymous diplopia, marked difficulty in talking and weakness of the muscles so that she had to hold up the lower jaw with her hand. The vision, fields, pharynx and the fundi (except for slight vessel tortuosity) were negative. The general physical examination including Kahn and Wassermann was negative except for slight increase in tendon reflexes. The diagnosis was myasthenia gravis.

She was placed on ephedrine treatment and showed marked improvement within ten days and for a month. She then discontinued the treatment and consulted a chiropractor and again became worse. She reported at the Clinic four months later and was put on eph-

edrine and glycine and again improved. This case is also significant because her trouble definitely followed a recent pregnancy as noted above.

Case 11.—A. C., a farmer, aged sixty-seven, was seen in February, 1934.

This patient came in complaining of difficulty in speech. He stated that his present illness began eight months previous. He had been seen with different complaints off and on since 1917. It was now hard to understand him and he had great difficulty in speaking. For the past month he had had trouble with liquids getting in his windpipe.

Diplopia, dysphagia and dysmimesis were present. His general physical examination was negative except for diabetes mellitus. The vision was fair; fundi showed lens opacities and retinal arteriolar sclerosis. The Kahn and Wassermann tests were negative. Diagnoses of Parkinsonian Syndrome, multiple sclerosis and syphilis were ruled out. The patient was treated with ephedrine and improved. Diagnoses of myasthenia gravis, diabetes mellitus and arteriosclerosis were made.

Case 12.—A. L., a farmer, aged fifty-two, was seen in March, 1936.

He complained of blurred vision and diplopia for the past year and a half. He had been seen by us two years previously and had been given a prescription for presbyopia. There was no diplopia at that time. He had been seen for irrelevant complaints for the past twelve years. At one time he had had ptosis and a transient glycosuria.

Ptosis and diplopia were present. Perimetric fields showed a slight enlargement of the blind spots, but vision was normal and the fundi were negative. General examination was negative. Encephalitis and myasthenia gravis were considered. Three months later, he had weakness of the hands and legs and still had ptosis and diplopia. Later he had trouble with talking and eating and had definite weakness of the extraocular muscles. He was treated with ephedrine. The diagnosis was myasthenia gravis.

Case 13.—Mrs. A. R. R., a housewife, aged twenty-three, was seen in January, 1938.

She complained of diplopia which had been present for a year and a half and was not helped by prisms. She had previously been here for refractions and other conditions, with no evidence of this complaint. Her general health was good. Of late she had had ptosis and complained that food lodged in her cheeks; she was also having trouble with her voice and a general muscular weakness and tiredness. She had been delivered one month previously. Although she had had diplopia and some trouble with her jaws, this was not so marked prior to or during her pregnancy. However, one month following the delivery, all of the symptoms increased and she became progressively worse up to the time we saw her.

The ptosis was so marked that she had to tilt her head backward to see. Diplopia was present. The ocular movements were poor, there being no full muscle

excursion in any direction. Her vision was fair and the fields and fundi were negative. The general examination was essentially negative. The diagnosis was myasthenia gravis.

Fig. 1. (upper left) Photograph of eyes prior to onset of disease.

Fig. 2. (upper right) Photograph showing ptosis of eyelids during myasthenia gravis.

Fig. 3. (lower left) Photograph showing position of eyes on attempting to look to the left.

Fig. 4. (lower right) Photograph showing position of eyes on attempting to look to the right.

She was placed under treatment with ephedrine sulfate grains three-fourths three times daily, and showed marked improvement within two weeks. She then returned to her referring physician. Note the photographs taken before and after the onset of myasthenia gravis (Figs. 1, 2, 3, and 4).

This is the second case in our series which showed a definite increase in symptoms soon after pregnancy, which confirms Viets and Schwab's observation that though the symptoms may not show prior to pregnancy yet they are increased after delivery.

Case 14.—A. W. S., a salesman, aged forty, was seen in September, 1936.

This case illustrates the possible rôle of infection in acute exacerbation of symptoms. This man became ill on September 10, 1936, when he noted very suddenly that he was very tired and weak and was hardly able to walk in the afternoon and evening. He felt considerably better on arising in the morning. On September 16 he had a severe, shaking chill, but he was not seen by a physician for several days and when he was seen, his temperature was normal. This is significant of an acute cold or grippe. The patient attempted to do his work as a salesman and had to drive considerable distances. He fatigued so rapidly that by afternoon it was occasionally necessary to carry him out of the car to his residence.

Complete physical examination and laboratory examinations (including spinal fluid) revealed only marked weakness of the voluntary muscles of the hands and arms. The findings were those of weakness without true paralysis. Sensation was always normal. Absence of ocular signs and symptoms was especially noted. The therapy consisted of ephedrine sulfate and amino-acetic acid with definite improvement.

He returned to work about January 1, 1937, and continued to take the medication for approximately

two years, since which time he has felt very well. There is no evidence of the previous symptoms and findings, and he has taken no medicine. The diagnosis was myasthenia gravis.

This case illustrates: (1) that it is not always necessary to have eye findings in a case of myasthenia gravis, nor do they necessarily precede the general muscular weakness, although they usually do; (2) that the symptoms were aggravated by an acute infectious episode.

From a review of the literature and from our own experience, it appears that the response of a particular patient to one form of therapy or even to a combination of different therapeutic agents varies. Reference should be made to these various agents. Edgeworth^{5,6} has reported on the use of ephedrine and also on the use of amino-acetic acid, and Boothby² on the treatment with glycine. Physostigmine was introduced by Walker²³ who also introduced prostigmine. The oral administration of prostigmine as brought out by Everts.⁷ Considerable further work is being done by these authors and also by Harvey and Whitehill¹⁰ who reported on the use of prostigmine both as a diagnostic aid and for therapy. The use of guanidine hydrochloride by Minot et al¹³ gives good results in the hands of some.

That care must be used in the oral administration of prostigmine is very apparent from the report of Goodman and Bruckner.⁹ Perusal of their article leads to the conclusion that one must be certain myasthenia gravis is present before prostigmine is used orally or otherwise in the treatment. Furthermore, the difference in the reaction to prostigmine in the body of a patient having myasthenia gravis compared to one not having the disease indicates a definite, distinct and different physiologic and chemical reaction.

Eaton⁴ of the Mayo Clinic has summarized very well the present therapy of myasthenia gravis in regard to the use of prostigmine, ephedrine, guanidine and potassium salts and in his conclusions states that for the average patient the oral administration of prostigmine bromide is his basic treatment.

In our treatment of these interesting cases we have gone through a similar evolution as to drug therapy. We now agree that no patient should be treated for myasthenia gravis without first having diagnostic tests made.

A striking point in the therapy of patients with this disease is the distinctive individual reaction

to each therapeutic agent or to a combination of therapeutic agents. Likewise, the optimal dose of a single drug or combination of several drugs varies considerably. Each patient must be considered separately and no established rules as to dosage will fit a large group of patients.

The patient must realize the type of affliction he or she has and must live within his or her limits of physical accomplishment. Every effort should be made to avoid efforts which produce fatigue. Rest at frequent intervals during the day is extremely important and is, of course, obligated by the more severe phase of the disease. Frequent feedings of high caloric value in small amounts may be indicated. It may be necessary in some instances to use a very highly puréed diet as the danger of aspiration and pneumonia must always be considered. The use of tube feedings may be required. Good general nursing care is of great importance, of course.

There are many simple helps both for the improvement and comfort of the patient while undergoing treatment. For the relief of distressing diplopia an eye patch over one eye may be used, or spectacles with one dark or frosted lens therein. A simple method for the patient who wears glasses is to paint one lens with clear nail polish. Prisms may be tried, but in our hands they were not very successful.

In our experience amino-acetic acid and ephedrine have been of definite value. One point that must be remembered is that the cost is a factor with some of our patients and medication which is expensive is, therefore, not available to some of them. When such is the case, the use of the less expensive ones would seem desirable, as they are much more likely to be continued and thus produce the desired results.

We have not had much experience with the use of guanidine and the potassium salts therapy and cannot comment on these two agents.

Prostigmine bromide by the oral route is of definite value and the cost is not excessive. The dosage varies again in each case, from the smaller dosage of two of the 15 milligram tablets daily to twelve to sixteen in the more serious cases, distributed throughout the twenty-four hours. Atropine may be needed to overcome some of the drying effects of the prostigmine. Prostigmine methylsulfate may be needed subcutaneously or intramuscularly, especially if the more serious types of symptoms occur.

In our experience at the Clinic, glycine and ephedrine have been of definite value and should at least be given a therapeutic trial. The dosage of glycine must be quite large. The dosage of ephedrine sulfate will again vary from $\frac{1}{8}$ to $\frac{3}{8}$ of a grain two to three times a day. Like prostigmine, it is probably best if comparatively small doses are used at more frequent intervals. It has an added advantage of not being too costly for the patient.

We have at present very definite therapeutic agents for the relief of and possible cure of myasthenia gravis. These are not costly and surely abolish the former hopeless outlook for the sufferers from this disease. As heretofore noted, they must adopt the proper living regimen.

It is obvious that to help these patients they should be seen at frequent intervals and remain under close competent medical care. Similar to other diseases with remissions, they may get discouraged or with improvement, think they are cured and then neglect their care.

Conclusions

1. We have endeavored to show that myasthenia gravis is not an uncommon disease.
2. Eleven cases have been reported to add to the literature.
3. In two cases the relationship of myasthenia gravis to pregnancy is brought out.
4. The definite diagnostic value of the prostigmine test is noted.
5. The present treatment is reviewed and our suggestions presented.
6. Cases of myasthenia gravis are no longer considered hopeless.

PORTAL CIRRHOSIS

CHARLES VANDERSLUIS, M.D.

Bemidji, Minnesota

THE liver is the largest organ in the body, being composed anatomically and functionally of two types of cells, hepatic and Kupfer. The hepatic cells are arranged in cords radiating from the hepatic veins like spokes from cylinders, thereby forming a mantle about the hepatic venous tree. Into this mantle interdigitate the branches of the portal vein and hepatic artery, running into the sinusoids between the hepatic cords. The sinusoids are tributary to the hepatic vein. The hepatic artery carries 25 per cent of the organ's total blood supply and almost all of its blood oxygen. The portal blood has a low oxygen saturation and probably gives up little oxygen to the liver. For this reason, necrosis of the hepatic cells quickly follows ligation of the hepatic artery. The nutriment carried by the portal vein, however, is equally essential to the liver cells.

The Kupfer cells play little part in our discussion. They line the sinusoids and, like other cells of the reticulo-endothelial system, form bilirubin from broken-down hemoglobin for excretion in the bile. The bile capillaries run in the liver cords towards the periphery of the mantle, emptying into the bile ducts in the portal spaces.

The functions of the hepatic cells are manifold and incompletely known. Among the activities essential to our discussion are the following:

1. Storage of carbohydrate as glycogen. Adequate glycogen content is essential to liver health.
2. Deamination of amino acids arriving from

the gut to form urea and fatty acid residue with further oxidation of the latter to available carbohydrate.

3. Maintenance of normal blood sugar level by conversion of stored glycogen.

4. Synthesizing or maintaining normal blood levels of heparin, prothrombin and possibly plasma proteins.

5. Storage of vitamins and antipernicious anemia factor.

6. Conjugation of glycine and taurine with cholic acid to form the bile acids and secretion of the sodium salts of these in the bile.

7. Excretion of bilirubin from the sinusoids into the bile capillaries.

8. Re-excretion in the bile of the urobilinogen and bile salts absorbed from the intestinal tract.

9. Excretion of cholesterol.

10. Storage of fat and oxidation of stored fats in the absence of glycogen.

With functions so manifold and vital, it is only natural to suppose a great reserve of tissue. Blood does not flow constantly in all the sinusoids but goes through periods of surge and rest, reminding one of the flow through glomerular capillaries of the kidney. Whipple found in poison experiments that destruction of two-fifths of each lobule in the dog could be repaired in a few weeks, the uninjured cells multiplying by mitosis and replacing the necrotic cells within the original reticular network, which is unaffected by liver toxins. The integrity of the portal blood supply is necessary for such regeneration, a significant point in this discussion of cirrhosis.

The regenerative capacity of the liver in the presence of portal cirrhosis was appreciated by MacCallum in 1904 when he drew a clear picture of the pathologic processes involved. He described gradual necrosis of liver cells, sometimes accompanied by fatty metamorphosis, with some regeneration by multiplication of adjacent uninjured liver cells, and replacement of lost tissue by outgrowth of connective tissues from the portal spaces. In other words, the mantle of radial cords about the hepatic veins is irregularly destroyed and incompletely repaired. Bile ducts proliferate in the portal spaces to connect with the remaining bile capillaries and maintain bile secretion. He pictured this as a gradual process of necrosis proceeding along with regeneration until the hepatic vein mantle becomes incomplete, leading to a microscopic picture of regenerating masses of liver cells without a central vein or with an eccentrically located central vein, and without lobular arrangement of the cords. By being denuded of the cellular mantle in places, the central veins come to lie in the portal spaces alongside the portal veins. MacCallum further described polymorphonuclear and round cell infiltration of the dying liver cells and mitotic figures in the adjacent healthy ones and related these to activity of the destructive process. He likened this to glomerulonephritis by saying that in the acute case the destruction of many epithelial cells stimulates the production of mitotic figures in those that are left, while, although regenerative changes are certainly present in chronic nephritis, mitotic figures are no longer found. With passage of time and progress of the cirrhosis, he observed contraction of the increased portal scar tissue with compression of some of the bile ducts and portal vein radicles resulting in jaundice (rather late) and portal obstruction with attempted establishment of collateral circulation between the portal and systemic venous systems.

Grossly the cirrhotic liver may be large or small, according to the amount of fat or fibrous tissue it contains and the degree of destruction of hepatic cells. The surface may be smooth or finely or coarsely granular. If it is granular, the depressions are vascular scar tissue and the elevations groups of surviving liver lobules, hypertrophied through regeneration. From clinical observations it is known that many of these livers are large in the early stages and shrink

later on, presumably because of disappearance of fat and contraction of scar tissue. Other livers remain larger than normal due to permanent overgrowth of fibrous tissue. McCartney showed that in the earlier decades active cirrhosis is accompanied by hypertrophy of the liver and in later decades by atrophy, these terms referring to weight. This agrees with the known shrinkage of the normal liver with age.

Related to portal cirrhosis and almost indistinguishable from it pathologically is Mallory's toxic cirrhosis, or healed yellow atrophy, described in 1911. This is comparatively rare, because yellow atrophy is highly fatal. However, the same processes take place as in portal cirrhosis: fatty degeneration and necrosis of liver cells, some regeneration by mitosis of adjacent uninjured cells along the unharmed reticular skeleton, inflammatory reaction in dead cells, formation of compensatory regenerating nodules, and shrinkage and fibrous tissue replacement of unregenerated cells. The main difference between portal and toxic cirrhosis is that the former is the result of a gradual intoxication while the latter results from repeated, well-defined, more severe insults with production of jaundice and bile in the urine. Cases of toxic cirrhosis have resulted from cinchophen and sulfanilamide. Some victims of such poisoning have not survived the atrophy to develop healing and cirrhosis. As a result of repeated insults, sometimes only two or three, the liver finally assumes a gross appearance similar to that of the more chronic portal cirrhosis except for more pronounced nodular hyperplasia. Children are more often victims of this type than of portal cirrhosis.

The etiology of portal cirrhosis differs in detail from case to case, but evidence from animal experimentation and preponderance of the disease in poorly fed people point to nutritional deficiency as a necessary predisposing cause. Alcohol has been incriminated with a good deal of justice, but it alone cannot cause cirrhosis in the presence of a good nutritional state of the liver. In the experience of pathologists fatty metamorphosis is the more common hepatic change in alcoholics. This is to be interpreted as a state of poor liver nutrition which will progress to cirrhosis if other liver injury is added to the continued poor nutritional state. Multiple neuritis, beri-beri, pellagra-like dermatitis and

other deficiency diseases have been found to co-exist with cirrhosis in the alcoholic poor, although it must be remembered that advanced cirrhosis itself reduces the assimilation of vitamins by the liver. Recently Rich and Hamilton produced portal cirrhosis in rabbits by a synthetic high vitamin diet lacking in yeast. Von Glahn and Flinn reported that yeast protected rabbits to some extent against developing cirrhosis from lead arsenate poisoning. The incidence of cirrhosis is high in Switzerland and goiterous districts of the United States, suggesting that depletion of liver glycogen by hyperthyroidism deprives the liver of normal protection against causative factors in cirrhosis. Experimentally, combinations of chemical poisons, such as phosphorus and alcohol, and chloroform and bacteria, have caused cirrhosis in animals. Moon and others have isolated streptococci from livers with active cirrhosis. Whatever the directly exciting cause, one can assume that there necessarily is a basic nutritional deficiency operating over a long period of time.

McIndoe of the Mayo Clinic made some illuminating studies of the altered architecture of the cirrhotic liver. To demonstrate normal conditions he injected the vessels of normal livers and made celloidin casts. These give a picture of regularly interlocking terminal branches of the portal and hepatic veins by way of the sinusoids. These branches are everywhere equidistant, separated by the width of the hepatic vein mantle of liver cords. In the cirrhotic liver, prepared the same way, he was able to show great defects in this mantle, allowing the hepatic veins to lie alongside the portal veins in the portal spaces, and also to show large spaces in the cirrhotic liver practically devoid of circulation. By injection through the portal vein he was unable to reach the sinusoids of the new hyperplastic nodules but he could reach some of them by injecting the hepatic artery. In substance, he found the new nodules were cut off from the portal blood supply by many small Eck fistulae taking the blood directly into the hepatic veins. Hepatic insufficiency, when it occurs, then, is usually not caused by loss of liver cells but by diversion of the portal blood from them through the intrahepatic shunting referred to above and the extrahepatic collateral circulation.

If the factors favoring continued liver damage continue, it is evident that the patient is doomed.

Fortunately, the process stops and becomes latent in some cases. McCartney reported 35 per cent of a number of cirrhosis cases seen at autopsy as latent, meaning those with no history of symptoms, no clinical diagnosis, and no necropsy evidence of ascites, hemorrhage, or esophageal varices. Obviously this means that some of these livers heal to all intents and purposes or that collateral circulation develops so uniformly that no local overload develops. McCartney's latent cases, on the whole, show histologically a milder grade of cirrhosis than the active cases with a history of symptoms. Enlargement of the spleen was less frequent in his latent cases. He found latent cirrhosis more frequent in males than females.

This high incidence of latency suggests that there are no presenting symptoms in early cirrhosis. This is borne out by clinical experience. Mild digestive disturbances and slight weight loss may bring the patient to the doctor, but the disease must be considered fairly advanced even then. Physical findings may offer a little help. Jaundice occurs in about 50 per cent of cases but is late because it results from intrahepatic obstruction of the bile ducts by contracting scar tissue. A transitory signal jaundice has been described as occurring at the onset of the disease in some cases, reminding one of the initial hepatitis described for toxic cirrhosis. The liver may be enlarged in early cases due to fatty infiltration. The spleen may also be palpable, but this signifies portal obstruction or a lowered serum albumin. Visible distention of abdominal veins is usually present only with ascites, but in a suspected case, infra-red photography may detect early collateral circulation. Esophageal varices, if detectable by x-ray, signify a rather advanced cirrhosis. Hemorrhoids may also be present but rarely are large if due only to collateral circulation resulting from cirrhosis. Spider angiomas are truly helpful if found in the absence of a family history of them. They are often the earliest physical findings, consisting of bright red lesions with central points from which radiate fine hairlike branches a centimeter in length. They are usually seen on the skin of the face, arms, fingers, and upper trunk.

Routine blood examination may furnish a lead in moderately advanced cases in that anemia is common. It may be of the pernicious type with the difference that free hydrochloric acid may be

found in the gastric secretion. It may undergo spontaneous remissions or respond to liver therapy. The anemia is never so severe as pernicious anemia, probably because the kidneys, too, have storage capacity for the intrinsic factor, but its severity is proportional to the extent of liver destruction. Since iron assimilation is usually faulty, the anemia may be hypochromic. However, macrocytosis and hypochromia have likewise been explained on the basis of lowered plasma albumin with imbibition of water by the corpuscles due to lowered osmotic pressure of the plasma.

Among the special blood chemistries, plasma protein determinations promise the most. Plasma albumin is diminished and globulin elevated in a great majority of all types of liver disease, especially cirrhosis. The liver normally stores a great deal of albumin or albumin-producing substances. Apparently it is unable to maintain adequate plasma albumin values when damaged. The globulin increases in a compensatory manner, making the total protein value normal in most cases. Qualitative changes in this globulin fraction are responsible for the most delicate tests we have for liver damage, Hanger's cephalin-cholesterol and Gray's colloidal gold flocculation tests.

The former is fairly simple. Normal serum will not disturb the cephalin-cholesterol colloidal system, but serum in hepatic disease produces flocculation of lipoids in from twenty-four to forty-eight hours.

Gray says that the gamma globulin is increased in liver disease, accounting for the parietic type of curve he gets in his serum colloidal gold test. The sensitivity of this test is quite amazing. In hepatico-lenticular degeneration, otherwise known as Wilson's disease, a hereditary neurological affliction coming on early in life, there is good evidence to indicate that cirrhosis precedes the neurological involvement in every case. Yet, the cirrhosis is silent at first, and the neurological symptoms bring the patient to the doctor. Sweet, Gray and associates in Chicago reported uniformly positive results with the colloidal gold test in these subclinical cases of cirrhosis.

The favorite at the Mayo Clinic, and the simplest of all, is the bromsulfalein test. Five mg. of the dye per kilo of body weight is injected intravenously, the blood serum collected after an hour, alkalinized, and compared with standards and normal serum. A retention of over

4 per cent is abnormal, the great bulk of the dye being excreted by the liver in the bile. This test is a good routine procedure in the absence of jaundice but lacks the sensitivity of the other two mentioned.

Thus, the diagnosis of liver damage early is seen to be largely a chemical problem and one to be undertaken largely upon suspicion aroused by digestive disturbances not otherwise explained or in the presence of multiple vitamin deficiencies or alcoholism in the poor. Diagnosis of cirrhosis in the advanced stages is purposely omitted from this discussion.

The best reason for this presentation is that there is a well established impression among experimental workers and clinicians that the liver can be protected against the action of liver toxins by proper diet. This diet must be high in carbohydrate to insure a good glycogen content of the liver. It must be low in fat to lessen the necessity for fat storage in the liver. Fat storage seems to be harmful even in the presence of a high glycogen content. The protein in the diet should be made up largely from vegetable sources and eggs and milk because of the impression that meat proteins place a heavy load on the deaminizing and uric acid destroying functions of the liver. Choline is thought to be highly protective against fatty metamorphosis.

The liver is a storage depot for vitamins A, C, D, and at least certain portions of the vitamin B complex. It uses vitamin K to produce prothrombin, essential to normal blood clotting. The badly cirrhotic liver responds to treatment with these vitamins rather poorly because of deficient circulation and loss of manufacturing and storing capacity. Since the avitaminosis of late cirrhosis is so refractive to treatment, early diagnosis and therapy become the more imperative.

To show what can be done with advanced cirrhotics, however, Patek and Post are treating a number in New York with a good diet and bed rest, supplemented by yeast and vitamin B₁. They have observed improvement in a substantial number, with disappearance of jaundice, edema, ascites, and vascular spiders in some of them. Seemingly a prognostic point, in their experience, is the initial level of the serum albumin. Those with the highest initial levels respond the best to treatment.

Butt and Snell of the Mayo Clinic recently reported that, after observing Patek's results, they have used this diet with some modification

for the past two years, with encouraging results. Their diet consists of from 350 to 500 gm. of carbohydrate, from 110 to 145 gm. of protein, and approximately 60 gm. of fat. They allow half the protein to be from meat to facilitate preparation of the diet. In addition, they give vitamins A and D in the form of concentrated fish liver oils in doses of from 25,000 to 50,000 international units once or twice daily. They give thiamine chloride, 10 mg. daily, in divided doses and from 8 to 12 ounces of citrous fruit juices daily. They also give from 30 to 50 gm. of brewer's yeast daily, mixing the powder with tomato juice or egg nog or giving the tablets. In addition, they inject crude liver extract two

or three times weekly or substitute the oral aqueous extract three times daily. Intravenous glucose is also used, especially in acutely ill patients with signs of hepatic insufficiency.

In conclusion, then, we are dealing with a degenerative disease of the liver which becomes latent in some cases but in most instances progresses silently to produce symptoms only when portal obstruction occurs. There is hope for these people in a protective diet, provided it can be administered early enough. The diagnosis of early cirrhosis depends upon keen clinical observation, thinking of the disease, and the application of several good tests for liver damage long before the advent of ascites and jaundice.

TETANY IN THE SEVERELY TRAUMATIZED NEWBORN

W. RAY SHANNON, M.D.

Saint Paul, Minnesota

BEFORE the days of blood chemistry the term "tetany" was ascribed to a certain clinical syndrome that was successfully treated with calcium. Because the conditions under which it cropped up were so varied, a group of descriptive words and phrases came to be attached, such as infantile tetany, maternal tetany, occupational tetany, puerile tetany, tetany in infectious diseases, etc. As a result of the advent of the chemical method, however, the modifying terms have changed so that we speak now of bicarbonate tetany, phosphate tetany, guanidine tetany, hyperventilation tetany, hypoparathyroid tetany and the like. This represents a distinct advance in that it adds definition to the diagnosis. At the same time it emphasizes the multiplicity of causes of tetany and should warn against any conception of etiology which does not take this into account. That warning has not always been heeded by those writing on tetany occurring during the newborn period.

Bakwin,¹ Farr,⁵ and others^{6,7} have attempted to place the diagnosis of newborn tetany on a chemical basis and to restrict it to infants having a blood calcium of 8 mg. or less. By so doing they would strike out from that class many of the most impressive cases that have been reported. Presumably this is done in the interests of science.

However, such a creed immediately raises the question of how much scientific value a type of thinking can possibly have when it eliminates opposing ideas, not by explaining them away, but by ignoring them.

Tetany was in the beginning, and still is, a clinical diagnosis, suggested by the group of symptoms observed and proven by the response of those symptoms to calcium therapy. Chemical analyses have done much to explain and clarify knowledge concerning that disease but, as yet, they have not gone far enough to settle all problems that clinical observation brings up. Not until that time comes can reasoning based upon chemical analyses hope to survive against opposing opinion based upon careful, accurate, and honest clinical observation. Theory based upon chemical analyses dare not fail to explain the clinical problems, for this is a situation in medicine where clinical facts, even more than usually, are the proving ground for chemical theories. Fact is a hurdle that theory, to survive, must jump. It is not an obstacle that can be circumvented.

Basing the diagnosis, not upon chemical analyses but upon clinical response to therapeutic effort, it seems obligatory to me that we broaden our perspective of etiology rather than restrict

it. This I have repeatedly tried to do in the past⁹ and this paper represents another attempt to continue this practice.

Ever since Bakwin¹ emphasized the probable importance of phosphorus in the etiology of this disease I have wondered if this might not be a connecting link which could explain a growing conviction that newborn tetany is really more common in severely traumatized infants. Such babies should have a larger amount of cellular destruction than those born normally, and if this should occur, phosphorus might be released and lend its aid toward the development of tetany. This might be expected especially in cases with extensive hemorrhage, whether it be within or without the cranial cavity. The following case, in which the hemorrhage occurred in subcutaneous tissues, illustrates and supports the theory.

Case Report

A baby boy, born by very difficult forceps delivery, was seen on the second day principally because he looked so badly. Incidentally, he had vomited some of his feedings. Examination revealed the fact that almost the entire scalp had been torn loose from the underlying tissues so that frank hemorrhage had occurred to the extent that the enlarged head felt much like a mildly inflated bladder. In spite of this tremendous evidence of local trauma nothing suggesting intracranial injury could be discovered. Furthermore, nothing suggesting newborn tetany was present.

Recalling past experience, I ordered parathyroid extract at once in anticipation of the development of tetany. In spite of the treatment the tetany syndrome began to appear within a period of twenty-four hours, and it was not under control for fourteen days. The only important measure employed was the injection of parathyroid extract, a total of 11.5 c.c. being given by the twelfth day of observation.

When, during the second day of observation, the tetany was seen to be increasing in spite of large doses of parathyroid extract, 25 c.c. of hemolyzed fluid from within the hematoma was withdrawn and analyzed for its phosphorus and calcium contents. The former proved to be 7.5 mg. and the latter 7.6 mg. per 100 c.c. of material. A second analysis, twenty-four hours later, at which time the rest of the available fluid was withdrawn, showed a phosphorus content of 6.7 mg. and a calcium level of 7.5 mg. per 100 c.c.

Following this second withdrawal, improvement seemed to increase definitely. This might be illustrated by the fact that up to this time, two and a half days after first observation, 5.5 c.c. of parathyroid extract had been administered without success in holding the tetany in check, while after this period a total of 6 c.c. was all that was required over a period of eleven and a half days to clear the tetany entirely. At that time, the blood calcium was 11.8 mg. and the blood phosphorus 7 mg.

Discussion

The reasoning behind the therapeutic effort in this case is directly attributable to suggestions made to me by Dr. Mildred Ziegler.¹¹ While explaining the manner in which hemolysis might increase the phosphorus content of blood serum she referred to articles by Martland and Robison,⁸ and by Binger³ as having important bearing on my problem at the time.

Martland and Robison showed that hemolysis caused an increase in the inorganic phosphorus content of the blood serum, and furthermore that even unhemolyzed blood, if kept fluid at body temperature for several hours, would increase its inorganic phosphorus by as much as 20 per cent. Binger demonstrated that phosphate possessed toxic qualities which were associated with a drop in the serum calcium level, and which might be accompanied by the development of tetany (except where acid phosphates were used).

These two papers afforded ample justification for the suspicion that hemolysis might be one of the factors behind the development of newborn tetany. This factor should have a certain limited influence even in the normal newborn in whom an appreciable amount of hemolysis must take place within the first few days of extrauterine life. But in the severely traumatized infant, in whom extensive hemorrhage had occurred, either in the form of frank hematomas inside or outside the cranial cavity, or just as extensive ecchymoses, a greatly augmented significance might reasonably be assigned to this process. From this background the determination to test the feasibility of this theory in the next favorable case developed. This infant seemed to present that opportunity.

Three methods of therapeutic approach presented themselves. The first was that of administering large amounts of calcium either by feeding or by injection. This should not only raise the calcium content of the body fluids but also neutralize phosphorus present. It is the method advocated by Bakwin. To prevent local precipitation of calcium phosphate² he suggests intravenous injections. However, I have shown that remote deposits of calcium in blood vessels and lungs is as possible as local precipitation.¹⁰ Intravenous injection would not eliminate that possibility, so the giving of calcium in any form was considered a dangerous procedure.

Parathyroid extract has the double value of in-

creasing the elimination of phosphorus and of raising the level of blood calcium and was therefore considered the ideal treatment for this case.⁴ The third procedure of value was peculiar to this case, namely, the removal of a reservoir of phosphorus by the aspiration of the hematoma fluid. The clinical course seems to indicate that this proved a valuable ally to the injections of parathyroid extract. Unfortunately, in a majority of severely traumatized newborns the removal of extravasated blood by this means would be impossible.

The importance of the observations made in this case, I believe to be very considerable. In the first place they give concrete support for my growing conviction, previously expressed, that tetany is more apt to develop in gravely injured newborns. They also may explain much of the confusion that exists in the minds of many over the differentiation of cerebral hemorrhage, for example, and the tetany syndrome. It has long been a contention of mine that many of the symptoms by which the former was diagnosed were at least frequently the symptoms of an accompanying tetany, and this case supports that belief. These things being true these observations permit an added hope in the outlook for infants severely injured during birth.

Summary

Tetany was in the beginning, and still is, a clinical diagnosis recognized by a characteristic group of symptoms and proven by the response of that group of symptoms to calcium therapy. It is erroneous to attempt to use a single chemical standard such as a blood calcium level of 8 mg. as the basis for diagnosis. These statements hold true for tetany during the newborn period as well as tetany in general.

I have gradually been forced to the conclusion that newborn tetany tends to occur more frequently in the severely traumatized infants. Many possible explanations are perhaps available for

this observation. This case supports a preconceived theory that one of the reasons for this fact is that hemolysis of extravasated blood releases enough inorganic phosphorus to upset the calcium-phosphorus ratio and reduce the available calcium sufficiently to bring this about.

In the treatment of these cases the administration of calcium by any means whatsoever is dangerous in that it may bring about a precipitation of calcium, probably always as the phosphate, within the body tissues, even far removed from the region at which it was introduced. The treatment of choice is the administration of parathyroid extract which acts not only to increase the concentration of calcium in the body fluids but also has the added advantage of increasing the elimination of phosphorus. In cases such as the one here reported, where the blood extravasation was sufficiently great in available areas to cause a hematoma, an effective aid to the administration of parathyroid extract exists through the aspiration of the hematoma fluid.

NEW LENS SIMPLIFIES EXAMINATION OF THE EYES

A lens which changes its focus in the same way that the human eye does, namely, by changing the curvature of its surfaces, has been patented by Robert Graham of Ohio State University. The oculist, in testing the eyes, instead of trying one lens after another, may put this single lens before the eye. Turning a little knob changes the focus, and a needle on a dial indicates the power. Two crossed cylindrical lenses of very thin glass (0.0028 inch) with liquid between them are used. Squeezing these together along the edges changes the curvature.—*Science News Letter*, October 17, 1942.

CLINICAL-PATHOLOGICAL CONFERENCE

MINNEAPOLIS GENERAL HOSPITAL

A. J. Hertzog, M.D., and S. V. Lofness, M.D.
Pathologists

Presentation of a Case

DR. ROBERT H. ALWAY: This case is that of a fifteen-month-old female child. The delivery was normal and she was apparently well until the age of four months when one of the Community Health Service attending physicians noted that she had a droop of the right eyelid and constriction of the right pupil. In November, 1941, at the age of five months, she was referred to this hospital. Physical examination at this time, including x-ray studies of her chest, was essentially negative except for the presence of Horner's syndrome. The right pupil was contracted, there was a unilateral enophthalmus on the right and the right eyelids were closer together. The cause for this syndrome was not determined and the patient was discharged with instructions to return at a later date. She was again seen in June, 1942. Physical examination including an x-ray study of her chest was again negative except for the presence of Horner's syndrome. In July, 1942, discrete lymph nodes were palpated in the anterior triangle of the right side of her neck. A biopsy of one of the lymph nodes was done, but it showed no tumor. During the next several weeks, a mass developed above the right clavicle just lateral to the sternocleidomastoid muscle. This gradually increased in size. A biopsy of the mass was done, but no definite pathologic diagnosis was made. It was the impression of the surgical consultant that the tumor was malignant. Deep x-ray therapy was advised, and was begun about the middle of August, 1942. During the course of her third treatment, she suddenly became cyanotic and developed intermittent noisy respirations. She was immediately returned to the floor and for three or four hours she had difficulty in breathing. Improvement made a tracheotomy unnecessary at that time. Further irradiation was not carried out because of the danger of tracheal obstruction from any sudden increase in size of the tumor. The child progressively became worse and on August 31 respiratory distress was so advanced that a tracheotomy was attempted. The trachea was found pushed to the left of the midline. While the trachea was being opened, the child expired.

DR. GRATZEK: We had several x-ray studies on this child. The radiograph of her chest in July, 1942, shows a discrete rounded density in the apical portion of the right thorax. In a preceding film, there is suggestion of the same thing, although it was called a negative film. It was only in July that the mass became definite on x-ray. The next picture after x-ray therapy was begun, shows an enlargement of the mass. It appears to be in the posterior mediastinum and has pushed the trachea to the left of the midline. I tried to fluoroscope the child but she struggled so much

that the examination was unsatisfactory. The final film shows marked enlargement of the mass with evidence of bilateral bronchopneumonia.

DR. PEPPARD: When the child was first seen, were there not any findings on physical examination that lead to the x-ray study of her chest?

DR. ALWAY: No. There were no physical findings other than the Horner's syndrome. Later the mass became demonstrable.

INTERM: What appeared to be the immediate cause of death?

DR. SHER: Death appeared to have resulted from mechanical pressure of the tumor on the trachea, and bronchopneumonia.

DR. GRATZEK: X-rays of her chest shortly before she expired show evidence both of bronchopneumonia and mechanical obstruction to the trachea.

DR. HERTZOG: This tumor fits in very well with what Pancoast described in 1932 as a superior pulmonary sulcus tumor. The tumor develops at the apex of the lung and invades adjacent structures. Destruction of the cervical sympathetic produces the Horner's syndrome. A majority of the superior pulmonary sulcus tumors are bronchiogenic carcinomas at the apex of the lung; but other tumors in this situation may produce the clinical syndrome, that is, sympathoblastomas and metastatic tumor.

DR. LOFNESS: We were not able to make a definite diagnosis from the biopsy, although it was studied by several pathologists. It showed dense fibrous tissue invaded by masses of very small intensely staining cells with little cytoplasm. Some of the cells were round, but many were spindle-shaped. There was no differentiation and no rosettes.

DR. HERTZOG: Does anyone want to venture an opinion as to the nature of the neoplasm before the autopsy findings are given?

DR. GRATZEK: I would say that a mass of this kind would be probably a neurofibroma or a teratoma, as they are not uncommon in the posterior portion of the upper thorax.

Autopsy Findings

DR. HEISE: At autopsy, the right pupil was larger than the left, measuring 5 mm. and 4 mm. respectively. In the chest, both lungs were found to be atelectatic in the lower portions. At the roof of the thoracic cage, after removal of the right lung, there was a rounded tumor mass 3 cm. in diameter attached to the right anterior surface of the sixth and seventh vertebrae. Its upper surface was irregular and extended up into the neck for a distance of 6 cm. It was very invasive, completely surrounded the right subclavian ar-

CASE REPORT

tery and vein. It had pushed the trachea approximately 3 cm. to the left and compressed its lumen. It was very difficult to remove the tumor because of its invasive character. After removal, the tumor measured $5 \times 6\frac{1}{2} \times 1\frac{1}{2}$ cm. On section, the tumor had a white fibrous appearance and was quite soft. On the anterior superior surface of the liver, there was a small white nodule measuring 0.5 cm. in diameter and another similar nodule on the surface of the left lobe measuring 3 cm. in diameter. A third nodule was found deep in the left lobe. It measured 0.5 cm. in diameter. No other areas of metastasis were demonstrated. A photograph of the child is shown that demonstrates the Horner's syndrome.

DR. LOFSNESS: Sections from the tumor show a malignant undifferentiated neoplasm. There is considerable necrosis present. It is composed largely of small, round dark cells with very little cytoplasm. There is a small amount of fibrous connective tissue stroma. The cells show no particular arrangement, although a few areas suggest rosettes. We know that we are dealing with a malignant tumor which has metastasized to the liver and produced death. The question of nomenclature arises.

DR. HERTZOG: The histologic structure suggests that the tumor arose from sympathetic nervous tissue and hence could be called a sympathoblastoma. A Bielschowsky silver stain failed to demonstrate any axones arising from the small dark cells. However, it is quite possible that the tumor is so undifferentiated that the cells have not developed axones. This tumor is closely related to the neuroblastomas arising in the adrenal medulla.

INTERN: If this tumor is related to those of the adrenal medulla, does it secrete epinephrine?

DR. HERTZOG: No, we are speaking of tumors arising from sympathetic nervous tissue. The type of neoplasm that may also occur in the adrenal medulla and secrete epinephrine is a tumor of the chromaffin cells of the adrenal medulla, and is called a paraganglioma or pheochromocytoma. It is a different type of tumor.

DR. MOOSNICK: Will tumors of sympathetic nervous tissue respond to x-ray?

DR. GRATZKE: I am not very well acquainted with these tumors, but we know that most tumors arising from nervous tissue do not respond very well. Medulloblastomas are an exception. X-ray therapy in this case apparently stimulated the tumor and some of the edema might have been caused by the therapy. In treating carcinoma of the larynx, radiologists usually ask that a tracheotomy be performed before they begin x-ray therapy, to guard against the effects of edema.

DR. LOFSNESS: To a certain extent, our diagnosis is by inference and exclusion. Tumors of the peripheral sympathetic system are more common in infants and young children. Also, the tumor was located along the right sympathetic trunk and was entirely extrapleural. Fisher classified these tumors of the sympathetic nervous system according to the degree of differentiation into (1) glangioneuroma, (2) neuroblastoma, and (3) sympathoblastoma.

Anatomical Diagnosis—(1) Sympathoblastoma of posterior-superior mediastinum and neck. (2) Metastases to liver and lymph nodes. (3) Mechanical obstruction and displacement of trachea. (4) Bilateral bronchopneumonia.

CASE REPORT

CHOLECYSTITIS DUE TO *SALMONELLA ORANIENBURG*

Report of a Case with Secondary Wound Infection

MILTON LEVINE, M.S., PH.D.
Minneapolis, Minnesota

THE case history to be presented is important since it illustrates an unusual cholecystitis and secondary wound infection with *Salmonella oranienburg*. This organism was first isolated in the United States in 1939,² and has been reported in only one other case of cholecystitis.¹

The patient was a white woman, aged fifty-one, who had a history of nausea and epigastric distress of about one year's duration. She was slightly icteric on admission. Her blood bilirubin was 6.4 urine urobilinogen 3, cholesterol 240. Her liver could be palpated 3 cm. below the right costal margin. A retrograde cholecystectomy was performed on May 26. Two grams of sulfathiazole powder was put in the wound. She received sodium sulfathiazole intravenously—1 gram on May 26 after the operation, 2 grams in 2 doses on the 27th, 4 grams in 4 doses on the 28th and the 29th. The Penrose drain was removed on June 2.

Pathologically, the gall bladder was thick-walled with a firm smooth mucous membrane. No common-duct stone was found, but the gall bladder was con-

tracted tightly around a large partially pigmented stone ($5 \times 3 \times 2$ cm.). Microscopic sections of the wall showed a large amount of fibrous tissue irregularly infiltrated with lymphocytes and plasma cells; the mucous membrane was largely destroyed.

Duodenal aspiration on May 27 yielded a pure culture of a *Salmonella* which was later identified by Dr. P. R. Edwards as *Salmonella oranienburg*. On June 7, a small stitch abscess developed in the healing incision and a pure culture of *Salmonella oranienburg* was isolated from this. The patient was discharged after the wound abscess disappeared.

Summary.—A case of chronic cholecystitis is reported with cholelithases in which *Salmonella oranienburg* is the probable etiologic agent. A secondary wound infection by this organism is described.

HISTORY OF MEDICINE IN MINNESOTA

PIONEER PHYSICIANS OF MARTIN COUNTY PRIOR TO 1900

By ROSCOE C. HUNT, M.D.

Fairmont, Minnesota

(Continued from October issue)

Dr. Walter J. Richardson^{2,3,4,10,13} was born near Rochester, New York, in 1856, of New England parentage. His great grandfather served throughout the Revolutionary War as an officer. Walter J. Richardson was educated at Carleton College and at Amherst, graduating from the latter school in 1881. He attended the Harvard Medical School and studied anatomy under Oliver Wendell Holmes. From Harvard he transferred to the College of Physicians and Surgeons of New York, where he was graduated in 1885. The same year he started practice in Minneapolis but soon afterward established himself in Hutchinson, where he remained until 1892. He then moved to Fairmont, where he carried on an active practice until about 1934.

During the forty and more years that he practiced in Fairmont he was a leading physician and citizen, quiet, unassuming, and never seeking publicity. He practiced a conservative and highly intelligent type of medicine. Although at heart a very tender and sympathetic man he had a gruff exterior. He had no sympathy for the cults and openly said so. If a patient whom he had treated well left him for a quack, Dr. Richardson never forgot it and would never render him further service.

For many years he rode a bicycle and was a familiar figure slowly pedalling around on his calls, and even into the country, with his medicine case hanging over one handle bar and a spring clip on his right trouser leg. This clip he wore most of the time whether he was on the cycle or not. He was a physician who when he had a long obstetric case or was attending a patient who had a serious illness, "lived with the patient" until the crisis was passed. His family learned never to be worried about him if he did not show up for twenty-four hours or longer. It was this faithfulness to his clientele that so endeared him to all his patients and proved that his rather brusk exterior did not indicate his true characteristics.

Like many physicians, Dr. Richardson lost a good deal of money in speculative enterprises. Probably the most notable speculation was a Rainy Lake Gold Mine into which he had put a rather large amount. He made a trip to the site, saw gold ore actually brought out of the mine, and then went out as a salesman for the stock. Of course, the mine had been planted and there never was any gold there.

Although he was interested in the welfare of the community and his judgment and ability frequently were used in various ways, he never sought public office. In politics he was an uncompromising Republican. He served as a member of the county draft board in World War I and impartially made or supervised the examinations of some 4,000 men. He belonged to many lodges and was especially active in the Odd Fellows and the Masons. He was a generous contributor to the Congregational Church.

Dr. Richardson's last illness and death were caused by a fractured spine. He died in his home at Fairmont, February 20, 1936, at the age of seventy-nine years. His wife, Sarah, who was a New England and a Mount Holyoke girl, outlived him about a year. Three children had preceded him in death; two, Walter Bradford and Ruth, live in Fairmont and Syracuse, New York, respectively.

Dr. William Henry Gough^{13,16,18} was born July 24, 1859, at Sioux City, Iowa. In 1865, the family moved to St. Joseph, Missouri. After attending high school, William Henry entered Ellsworth Medical School St. Joseph, and was graduated in 1884.

Dr. Gough settled in a small town on the plains of Kansas. The population, mostly Bohemian, had the idea that unless a doctor could cure a patient in one visit he was no good. After battling poor pay, dust and drought for a year, Dr. Gough moved back to St. Joseph and was for six years house physician to a large children's home and hospital.

In 1892 he decided to enter private practice and settled in Worthington, where he remained five years. In 1897 he moved to Sherburn, Martin County. After eight years he again changed residence, going in 1905 to Granada, a village ten miles east of Fairmont. Here he has remained and at the time these notes are compiled (1942) still does some practice to accommodate old friends.

In 1890, Dr. Gough was married to Ida Gould More, a minister's daughter. There were two daughters of this marriage. Mrs. Gough died in 1923. In 1926, Dr. Gough was married to Mrs. Nellie Newell.

His early experiences in medical practice were similar to those of other pioneer physicians. He relates an experience while at St. Joseph, in 1884, when attending a Negro woman. It was 30° below zero, one entire window was devoid of glass and there was a little stove in the center of the room that was red hot. During his stay he had to keep turning around to avoid freezing. Finally the baby came and seemed to like the cold, since it as well as the mother made normal progress. At another time while in Sherburn Dr. Gough made a trip through drifts fifteen miles to Cedar Lake where he attended a confinement. The thermometer registered 45° below zero. The shanty was so cold that he left on his buffalo overcoat and his overshoes throughout the procedure.

Dr. Gough has always been a typical "doctor of the old school" and a man of high standing. In his community he has served in many ways other than professional. He always has stood for the best things and has been a faithful supporter of the Congregational Church. It seems probable that with fifty-eight years of practice, Dr. Gough is now the oldest practitioner in this section of the state.

Dr. Clarence C. Donaldson^{16,21,22} was born at Dundas, Minnesota, on December 5, 1858. His father was of Scottish descent and had come to Rice County from Pennsylvania in 1856.

Clarence Donaldson began his education in the country schools and afterward attended Carleton College. For several months he studied medicine in the office of Dr. William Greaves of Northfield. He later attended a course of lectures at Iowa City, and in 1887 was graduated from Western Reserve University at Cleveland. After a few months' practice in Goodhue County he settled in Clark County, South Dakota, where he spent three years. In the fall of 1890 he came to Fairmont, where he practiced for fifteen years.

Dr. Donaldson was married to Sarah Hine who came from Indiana County, Pennsylvania. There were three children, Samuel, Lavinia, and Robert.

Dr. Donaldson was a large, tall, fleshy man weighing about 300 pounds, very genial and popular. Because of the many friends he made and his ability and success as a physician he had a large practice. His politics were strongly Republican. He was an Odd Fellow and held many offices in the Lodge; he also was a Woodman, a Workman, and a member of other orders.

He was a great horse trader; in fact, horse trading was his hobby. This avocation well fitted into his free, happy character. The populace thought the doctor was slipping if he drove the same team more than a week. While it is almost a universal fact that doctors always lose on any speculative venture, it is said that Dr. Donaldson was never known to have got the worst of a horse trader.

In 1905, he left Fairmont and moved to Denver, Colorado, later going to Strasburg and Arriba, where he practiced until his sudden death which occurred May 24, 1929.

Dr. E. H. Foster^{13,20} was known to have practiced in Sherburn in the eighties and for some years. His license is registered in the records of the Clerk of Court and is dated November 28, 1883. The directory of the State Board of Medical Examiners lists him in the 1890 Directory as residing at Sherburn and in the 1895 directory as at Fairmont. However, inquiry fails to show that he ever practiced at Fairmont and evidence indicates that he was only a short time at Sherburn.

Dr. F. W. Weeks came from Jackson County. His license was dated February 10, 1887. He was a homeopath and a graduate of the Medical Department of the University of Iowa in 1884. The directory of the State Board of Medical Examiners lists him in 1890 at Sherburn and in 1895 at Welcome. However, the former entry is undoubtedly in error as he is known to have practiced at Welcome from 1887 until the middle nineties.

Dr. John Janss²⁰ was licensed October 8, 1895, and the same year established his residence in Welcome. He remained there until about 1910, when he went to California where he still lives. He has practiced medicine in California and has been in the real estate business.

There were several physicians who, although they might not be considered as pioneer physicians, came to the county at the close of the century and began distinguished and extended careers.

Gustav H. Luedtke was born on a farm in Watanwan County, November 18, 1870. His early life was spent there. He was graduated from the University of Minnesota after having taught a number of years. He settled in Fairmont in 1899 and at the time of this writing is in active practice.

Henry P. Johnson was born in Oshkosh, Wisconsin, February 3, 1855. He was graduated from Rush Medical College in 1879. After practicing a number of years in Houston County he settled in Fairmont in 1899. He practiced actively until 1935, when he retired and turned over his practice to his son, Dr. Donald W. Johnson. At this time (1942) Dr. H. P. Johnson is in very poor health.

THE SEARCH FOR UNITY

If we are to have a durable peace after the war, if out of the wreckage of the present a new kind of coöperative life is to be built on a global scale, the part that science and advancing knowledge will play must not be overlooked. For although wars and economic rivalries may for longer or shorter periods isolate nations and split them up into separate units, the process is never complete because the intellectual life of the world, as far as science and learning are concerned, is definitely internationalized, and whether we wish it or not an indelible pattern of unity has been woven into the society of mankind.

There is not an area of activity in which this cannot be illustrated. An American soldier wounded on a battlefield in the Far East owes his life to the Japanese scientist, Kitasato, who isolated the bacillus of tetanus. A Russian soldier saved by a blood transfusion is indebted to Landsteiner, an Austrian. A German soldier is shielded from typhoid fever with the help of a Russian, Metchnikoff. A Dutch marine in the East Indies is protected from malaria because of the experiments of an Italian, Grassi; while a British aviator in North Africa escapes death from surgical infection because a Frenchman, Pasteur, and a German, Koch, elaborated a new technique.

In peace, as in war, we are all of us the beneficiaries of contributions to knowledge made by every nation in the world. Our children are guarded from diphtheria by what a Japanese and a German did; they are protected from smallpox by an Englishman's work; they are saved from rabies because of a Frenchman; they are cured of pellagra through the researches of an Austrian. From birth to death they are surrounded by an invisible host—the spirits of men who never thought in terms of flags or boundary lines and who never served a lesser loyalty than the welfare of mankind. The best that every individual or group has produced anywhere in the world has always been available to serve the race of men, regardless of nation or color.—RAYMOND B. FOSDICK: The Rockefeller Foundation—A Review for 1941.

President's Letter

I.

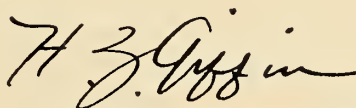

The drafting of men, eighteen and nineteen years old, makes it imperative to devise some plan for the selection and education of premedical students. Some have said that there will be too many physicians when the war is over and consequently that the training of physicians could be curtailed now, or confined to those who have physical disability which makes them unsuitable for the armed services. I doubt this statement very much. At present physicians who planned to retire are continuing in practice and many of those who had already retired have returned to practice; by the time the war is over, another group of doctors will be ready to retire; a certain number will be lost in service. All of these groups together will reduce the number of physicians available for active practice after the war. We, therefore, cannot consent to curtailment of medical education or to any reduction in the number of medical students. Correspondents returning from Europe speak of the great shortage of physicians and the difficulties of supplying adequate medical care there. Health and medical care are of primary importance to the country in peace as well as in war. Let us not fail to prepare for adequate medical care not only during war but after the war.

It is impractical to train physicians without premedical instruction. Men entering college might take up their premedical courses at once and be deferred as long as they maintain satisfactory grades. The number of premedical students would have to be limited to the number previously accepted in each college; otherwise too many students would apply for premedical courses. Or men might be drafted in the regular way and assigned to colleges for premedical courses on showing serious and competent intention of studying medicine. Two years of premedical college work should be sufficient during the war. The medical schools which demand three years of college work or a bachelor's degree could modify their requirements temporarily.

By the time this appears in print, legislation may have taken care of the situation satisfactorily. If not, let us use our influence to see that education of physicians does not suffer. If protective legislation has been passed, physicians who act as examiners and advisers to local selective service boards should assume the duty of seeing that regulations are carried out in a manner which will protect those who qualify for premedical courses and medical training, and, if necessary, to impress the boards with the importance of supplying an adequate number of students.

II.

Individually physicians are poor politicians. Only by organization, eternal vigilance and legal guidance can they protect the people from legislation detrimental to public health. Although they are poor politicians, physicians now have the opportunity to be minor statesmen. They are in a unique position for they can be important factors in the maintenance of morale during the war. By training they think first of the condition of the patient and his family and only secondarily of other considerations. This close association with the family group and its problems gives them an opportunity to counteract rumor, quiet discontent, uphold the principles of sound patriotism and sustain the flagging spirits of those who carry on in spite of deaths in service and illness at home. In the event of a long war maintenance of civilian morale will undoubtedly be an essential factor in victory. Physicians will prepare themselves for this role by evolving a sound philosophy and expressing their views with caution, consideration, and with regard to the effect on the individual, the family, the community and the country's war effort. Careless remarks and superficial criticism can do great harm.

MINNESOTA PROCUREMENT AND ASSIGNMENT COMMITTEE

THE *News Letter* recently issued by the State
Association has informed you that Minne-
sota's 1942 quota of physicians for the armed
services will be filled by next January. The pro-
fession of our state deserves congratulations on
the successful fulfillment of their obligations.
Not alone have they supplied needs of the armed
forces voluntarily by their own efforts, but they
are continuing to safeguard the health of home
communities without any serious break in these
sources. They have demonstrated that they not
only are able to do so, but that they are best fitted
to solve all problems of medical care.

Although the 1942 quota of physicians from
Minnesota for the armed forces is now virtually
filled, it should not be inferred that the respon-
sibility of the medical profession in providing
medical care for home communities and the
armed services is over even for this year. Many
problems requiring the active coöperation of the
medical profession remain to be solved. It may

be of interest to review the progress that has
been made by the Minnesota Procurement and
Assignment Committee and the indications for
the future.

In the first place, the medical profession in
Minnesota should be congratulated on the fine
spirit of coöperation it has shown and its willing-
ness to sacrifice personal interests for the good
of the country. Let it be an example for men in
other walks of life. The work of the Committee
got off to a slow start, owing to delays and to
confusion in the minds of the profession as to the
intent of information blanks which were sent to
them from Washington. The majority of those
who were declared available by the Committee
responded without delay, however, when their
call to service came.

It is of interest to note that our quota will be
completed without counting interns, residents
and fellows who were enrolled in various hospi-
tals and in the two institutions of learning in
Minneapolis and Rochester. A large group of
these physicians went into the services from
Minnesota, but since they have not been engaged
in actual practice in their communities, they are
not accredited to this state. It is also of interest
to note that the quota does not include those phy-
sicians who were in the Medical Reserve Corps.
With the inclusion of these groups the number of
physicians from Minnesota would amount to
more than 1,000 or, roughly speaking, a third of
the profession.

Although the Medical Officers Recruiting
Board in Saint Paul is now closed, it will never-
theless be necessary to furnish physicians for
proposed future increases in both of the services.
According to the latest statement issued, the
Army for 1943 will reach 7,500,000 men. While
medical care for the present force is well pro-
vided for, a definite increase in the number of
physicians, and readjustment of those already en-
rolled, will have to be made in order to take care
of the number proposed for 1943. With an esti-
mated air force in the Army of 2,500,000 men,
the number of physicians allocated to that branch
of the service, which will be well over 8,000, is
not too large. The peculiarities of that service
require a much higher ratio of physicians than

the average. The need of the armed services right now seems to be for younger physicians.

The Navy is well equipped for the present so far as medical care is concerned. In fact, it is said that a surplus pool of physicians now exists in the Navy which will be drawn upon to take care of 1943.

In making plans for next year, it will be necessary to continue where we left off and add sufficient physicians to meet the needs as they arise. The State Committee proposes to review the list of remaining physicians in the state carefully as to their availability for service. It may be impossible to take many more men from the rural areas of the state. However, some physicians can be spared from communities of moderate size and many more must come from the Twin Cities. It also will be necessary to draw upon that group over thirty-seven years of age. However, the Committee will continue to make every effort to avoid endangering community health and to scrutinize carefully the community needs.

Another problem confronting the Procurement and Assignment Committee is to find older men to take the place of younger physicians who have gone or could go into service. So far we have not met with much success. It would seem that such a sacrifice on the part of a physician might deserve as much credit as actually going into the armed services.

The Committee is at present making a survey of the needs of the industrial areas. A subcommittee having this problem in hand will soon be appointed and will do all it can to take care of this situation as necessity demands.

Your Committee believes that the physicians of Minnesota deserve great credit for the coöperation they have given us, and we are looking forward to continued coöperation in the future as the needs arise. After all, is there a physician in Minnesota who would not make any sacrifice necessary to help our country win the war?

W. F. BRAASCH, *Chairman*

LIFE INSURANCE FOR PHYSICIANS IN SERVICE

A PHYSICIAN who enters the service would naturally ascertain the status of his life insurance policies. He should first find out from a perusal of his policies in force whether they have a war risk exclusion clause. Policies written since the fall of 1941 contain such clauses.

Some physicians cannot maintain their life insurance programs while in the service without borrowing. Physicians should know that according to the Soldiers and Sailors Civil Relief Act of 1940 those in service can obtain a moratorium on premiums on life insurance policies not in excess of \$5,000 taken out before October 17, 1940, the date of the approved act.

In order to take advantage of this moratorium a Veterans Administration Insurance Form No. 380 should be filled out and sent to the insurance company and a copy to the Veterans Administration. The Veterans Administration will issue a certificate of the U. S. Treasury to the insurance company to cover all deferred premiums.

As in World War I a man in service may take out a government term policy which will terminate in five years unless converted before the end of that period. This policy makes no provision for total or permanent disability as in 1917, but does provide for waiving of payment of premiums during continued total disability.

It is perhaps unnecessary to advise physicians to apply for a government life insurance policy on entering service, to take effect immediately.

PHYSICIANS IN SERVICE

WE are particularly desirous of receiving news of the many members who are in service for publication in MINNESOTA MEDICINE. Of course, certain information as to the whereabouts and activities of some members cannot be made public. But those of us who for one reason or another must stay at home are interested in what members in service are doing.

Only those who are or have been in service realize the interest those away from home have in the activities of friends and acquaintances in other branches of the service as well as at home. In this connection we wish to remind those in service that a notice of changes of address sent to MINNESOTA MEDICINE, 2642 University Avenue, Saint Paul, will bring the journal to their new addresses. This applies even to those in foreign countries for there is no government restriction to the mailing of the journal outside the boundaries of the United States.

On the whole, we stay-at-homes rather envy those who have signed up. We realize that in most instances those in service have given up practices, built up over a number of years, or medical positions and are making a financial sac-

rice. Committees might well be appointed in each county society to work out details to protect the status of members entering the service. While many of the suggestions which have been made are not very practical, at least some publicity should be given to the idea that in fairness patients, hospital and medical school appointments and medical positions should be available after the war to returning physicians.

CAN CALCIUM THERAPY PROTECT TEETH?

THERE are still, it appears, physicians and dentists who prescribe calcium, at any and all periods of life, for the promotion of resistance to dental caries. Recent dental research, however, has shown that several cherished beliefs in regard to calcium therapy should probably be abandoned. Chief among the fallacies to be discarded are these: (1) Caries increases during pregnancy because the fetus withdraws calcium from the teeth of the mother; (2) a child can be endowed with caries-resistance through prenatal calcium therapy; (3) caries resistance can be promoted by a high calcium intake after teeth are fully formed.

Dr. Isaac Schour of the University of Illinois and his co-workers have shown fairly conclusively that dental troubles in the expectant mother are *not* due to withdrawal of calcium from her teeth by the fetus. An adult's teeth contains less than a thimbleful of calcium, or only about 1 per cent of the body's supply. The great calcium reservoir is the bones, from which the fetus draws what it needs. No calcium, moreover, can be withdrawn from or deposited in teeth that are fully calcified, because such teeth are avascular and acellular, providing no mechanism for the transfer of calcium. Sound medical reasons often exist for increasing the calcium intake of a pregnant woman, but among these reasons that of tooth protection is conspicuous by its absence.

There is considerable doubt that pregnant women have more dental decay than nonpregnant women of similar ages and habits. Caries often occurs during pregnancy, just at it may occur in anyone at any stage of life. Gingivitis of pregnancy is also a well-known condition. The physician should advise the pregnant woman to visit her dentist, in order that the dentist may remove areas of infection, fill the teeth, and give general care to the gums.

Increased calcium during the period of gestation is as ineffectual for the developing teeth of the fetus as it is for those of the mother. As the late Dr. Rudolf Kronfeld has shown, all calcification of the permanent teeth occurs postnatally, and even in the deciduous teeth, calcification of most of the outer portion (the part subject to decay) takes place after birth. Thus the prenatal diet of the mother, though vastly important for other reasons, has little influence on the future condition of her child's teeth.

During the period from birth through early adolescence, foods rich in available calcium are probably of great significance for dental health, because it is during those years that the teeth are calcifying. For growth and development and the maintenance of a satisfactory level of blood calcium, such foods are needed all through life, but their period of usefulness for the teeth is probably limited to the first fourteen years.

The individual physician must of course use his own judgment in the matter of prescribing extra calcium for patients of any age or condition. But in regard to the use of calcium to protect the teeth, he may well profit from these recent findings of dental research.

VERN D. IRWIN, D.D.S., M.P.H.
Director, Division of Dental Health
Minnesota Department of Health

Attention is called to the President's Letter which appeared in the October number of MINNESOTA MEDICINE. The subject was medical education in wartime.

The training of undergraduates in medicine is highly essential at the present time in order to assure a sufficient supply of physicians in the near future for the services and also for civilian practice. In order that properly trained physicians continue to be graduated the medical schools should not be stripped of their faculties. Those on the medical faculties under the age of forty-five who are declared essential by the Procurement and Assignment Committee need not feel uncomfortable because they are not in uniform.

The officers of the County Societies particularly should read the letter mentioned for it makes valuable suggestions regarding desirable programs for medical meetings. Though distance and time will necessitate the cancellation of national meetings and though those not in service are likely to be overworked, every effort should be made to provide interesting and instructive programs for meetings which can be held such as those of the county and regional societies and of the hospital staffs.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the

Minnesota State Medical Association

George Earl, M.D., Chairman

CO-OPERATIVE MEDICINE SPEAKS ITS MIND

Leaders in the coöperative movement from all over the country met in convention in Minneapolis last month and devoted full attention at several sessions to coöperative plans for prepaid medical service.

Several personages of note among the small group of pioneers who have extended the coöperative idea to medical service were present. Among them were Dr. M. D. Ogden of Trinity Hospital, Little Rock, Arkansas, Dr. A. L. Curtin of the Milwaukee Medical Center, Milwaukee, Wisconsin, and Dr. J. P. Warbasse, president emeritus of the Coöperative League of the U. S. A. and director of the Group Health Association of New York.

It was obvious in the day's discussions that all is not clear sailing among the medical coöperatives; that the same problems which confront prepayment plans sponsored by medical societies are puzzling the lay coöperatives; that, as a group, these people in their optimism are likely to discount the difficulties detected by the clear cold eye of the actuarial expert; that the attitude of physicians everywhere baffles them.

Educating Doctors

How to educate the doctors and bring them into line occupied considerable discussion time. How to educate the public also appears to be a hurdle. Not only must the public be convinced of the desirability of so-called budget medicine but subscribers must be taught how not to abuse it. In fact, the problem which confronts them and all insurers for medical expense is tremendous. Most of them are convinced, however, that the coöperative is the simple and obvious solution of all problems.

Education of the public was considered in an optimistic spirit. Education of the doctor was somewhat less hopefully discussed.

"Medical Man Has Quirk"

Said Dr. Curtin, whose Milwaukee Center has been officially opposed for years by the Milwaukee Medical Society:

"The medical man has a peculiar quirk in his make-up. He has been taught to believe that budget medicine is socialized medicine—and that, of course, really means state medicine. Actually, budget medicine carries with it a change only in economic aspects and methods of payment for services. It leaves scientific requirements unchanged and allows to the profession all the rights and dignities connected with complete control of medical procedure.

"It is admittedly difficult," said Dr. Curtin, "to make your average doctor see that, because he has been taught to study nothing that does not emanate from Leland (God of Medical Economics) of the American Medical Association. If he can be persuaded to break loose he will find that the budget medicine or socialized medicine, in this sense, holds a great appeal, especially for the general practitioner. It is possible that some specialists are overpaid. But the general practitioner, at least, is greatly underpaid in comparison with officials of corporations. It should be our special problem to show the general practitioner that it is to his advantage to practice budget medicine and that fee-for-service medicine is becoming more and more difficult to finance.

Must Recognize People's Rights

"We doctors frequently make the statement that we, and we only, know what the people need and how we should be paid for our services," Dr. Curtin further declared. "Doctors do know what treatment the people need but they must recognize the right of the people themselves to plan how they are to pay for that treatment."

"Education of subscribers is also essential," he said. "People must be given explicit information about the service offered, who is to give it and what it is to cost. Prices for services must not be lumped with costs of materials. People must know their rights and privileges and their responsibilities and what recourse they have in case of infringement. Inevitably a few will abuse their privileges and others won't use them at all.

Deductible Amount Bad Practice

"It is wrong to tell people that you offer a complete service because there aren't enough doctors or hospitals

anywhere to offer a complete service. Tell them instead that you offer adequate and efficient medical care and such care must include preventive medicine from the cradle to the grave. In Milwaukee we strive to get everybody in for periodic checkups. We feel that the periodic examination counts in reducing home calls and lessening turn-over.

"We have found the deductible amount (initial cash payment before benefits are available) is bad practice. It raises a barrier and stops people from coming in early for treatment. Above all," Dr. Curtin asserted, "we must not offer cheap medicine because cheap medicine is expensive at any price. Budget medicine must be good medicine offered at a fair price with a method of payment which is not painful."

Doctor Hannah Disagrees

The question of periodic physical examinations brought some disagreement, however, principally from Dr. J. A. Hannah of Toronto, Director of the Toronto insurance plan, which is sponsored by the medical society there. This plan utilizes all physicians and existing facilities, in contrast to the Milwaukee plan directed by Dr. Curtin, which hires a staff to care for its subscribers.

Dr. Hannah approached consideration of periodic examinations from a notably realistic point of view.

"Experience has shown," he said, "that only about 15 per cent of those who present themselves without noticeable symptoms for examinations do actually have some disease that can be discovered in the course of the examination. If the public can pay 100 per cent for a 15 per cent return on physical examinations all right. But these examinations must be paid for in addition to the premium for other service or your financing will be insecure."

Immunization to Health Departments

The question, Can budget medicine take on other phases of preventive medicine, such as immunizations and nutrition work, provoked much discussion but the answer, generally, was "No." These phases of disease prevention belong properly to health and welfare departments in co-operation with physicians, it was pointed out. Budget medicine cannot undertake to provide food or cod liver oil. To detect malnutrition and direct its correction is part of the work of the doctor but to provide correctives will add to the cost or take away from service which is the essential job of medicine.

It was suggested that clinics provide services on a more economical basis and are therefore essential to budget medicine. Dr. Hannah, with five years of experience back of him to prove it,

declared, on the other hand, that efficient care can be given through existing facilities including private practitioners of the subscriber's choice.

Toronto Experiences

In Toronto they have paid their bills and built up a reserve. Dr. Hannah therefore believes their system is good. It does not yet provide the maximum service for the minimum fee, however, and for that he gives the following reasons:

"The public doesn't know how to use the plan properly for one thing," he said. "We paid out \$12,000 just to satisfy curiosity at first. The subscriber paid his dues and then dropped in on the same trip to see his doctor, on any trumped-up excuse, just to see if the plan worked. We were obliged to move away from the doctors' building to stop that. Furthermore, equipment is not adequately used. There is no economic soundness in having five x-ray machines in five doctors' offices, side by side. I would like to see existing facilities of medicine used far more efficiently than they are at present. I would also like to see doctors working together more closely than they are now so that they can let each other go at intervals for post-graduate training without endangering their practices. When they do and when they solve the equipment problem, the picture will be different. Clinics can do both, of course. But clinics are not proof against sending in extra, unwarranted bills. The fact is that neither the profession nor the public has seen the problem," Dr. Hannah concluded. "We're just cutting our teeth in this matter and sometimes we have to bite in painful spots. We're still learning and we must approach our problems in a patient manner. Certainly the profession is no more stupid about it than the public itself."

"I am impatient with the doctors as an organization," he said, "for their unwillingness to see the point of view of laymen and the propriety of a lay organization to handle medical bills.

"At the outset, we proposed to make an arrangement for medical service through a single clinic and kicked our heels for a whole year before the county medical society disapproved and the clinic found itself unable to go ahead.

"We Kicked Our Heels"

Mr. George W. Jacobson of Saint Paul, Executive Secretary of Group Health Mutual, first coöperative prepayment plan to establish itself in Minnesota, was obviously disgruntled as a result of his own efforts to arrange medical service for Group Health in Minnesota.

Prefers Clinics

"Subsequently we were obliged to use the indemnity method by which any clinic or physician could give the service. It's a kind of glorified accident coverage. (Note: Group Health Mutual is now selling two pol-

icies, one dealing only with medical service from clinics and the other giving the subscriber limited service with free choice of physician.) We prefer to deal with clinics because we find clinic men as a rule better educated to the public need and better trained to efficient use of equipment.

"It is difficult to see how people can get the care they need under the present fee schedules," Mr. Jacobson said. "The only way to meet the situation is through organizations in which laymen have something to say about the economic approach. Doctors, of course, fear that fees will be cut under such a plan. That may not be the case. To date, there are too many unknown factors to permit putting medical service on an out-and-out actuarial basis. It is likely, however, that if doctors themselves controlled all phases of the plan, more and more funds would be required for fees. Laymen should be in control of facilities."

Personnel Troubles

Dr. Ogden discussed immediate difficulties of maintaining personnel for coöperative groups served by a hired staff in wartime. Five out of his staff of twelve at Little Rock have already been called to military duty and it is impossible to get replacements up to standard. He believes that group health coöperatives are being penalized by means of the war shortage of physicians and even accuses local Procurement and Assignment committees of releasing too many of his men for military service. The civilian within the coöperative also needs care, he declared.

Cites Fortune Poll

Mr. A. G. Stasel, Business Manager of the Nicollet Clinic of Minneapolis, called attention to the *Fortune Magazine* survey, results of which were published in the July issue, which showed that some 73 per cent of the people questioned expressed a desire for some type of prepaid medical plan.

"It is freely prophesied," he said, "that prepaid medical service will receive a great impetus after the war. Group hospital and prepaid medical plans are regarded by actuarial experts as the most hazardous of any type of insurance for the reason that the decision, so far as benefits are concerned, lies in the hands of the insured. Some development of a mutuality of interest is essential to keep it on a sound basis of public interest."

Doctors Are Studying

The fact that medical organizations, including the Minnesota State Medical Association, are giving the entire question of insurance against costs of sickness their careful and disinterested attention has evidently escaped these impatient organizers.

They seem to be very little aware of the scope of the studies nor of the interest displayed by the very men they criticise in every development which holds promise of easing payment of the patient's bill.

After careful inquiry into experience in many quarters, the Committee on Sickness Insurance here has not as yet seen fit to sponsor any insurance plan of its own. Nor has it lent official sponsorship to any lay group undertaking of the sort. This course was adopted with the approval of the House of Delegates of the medical association and is the result of an honest endeavor to map a sound policy for Minnesota and to avoid pitfalls that are inevitably associated with pioneering in this complicated field.

It is very evident that the difficulties of the task to which they have set themselves rest lightly upon the advocates of coöperatives. The setbacks and obstacles already encountered, they have willingly laid to what seems to them to be the general refractoriness of the medical profession.

The actual dangers inherent in lay control of medicine have obviously, and perhaps naturally, escaped them altogether. If prepaid plans for handling costs of medical care actually prove to be the pattern of the future, it is certain that physicians will not block the way; but their knowledge of medicine and of the needs of sick human beings will be the essential ingredient of success and it must be applied, even to the discomfiture of some individual undertakings, to protect American standards for care of the sick.

NORTHWEST CONFERENCE REVIVED

When the Northwest Regional Conference was first organized under the presidency of Dr. W. F. Braasch of Rochester in 1927, officers concerned had in mind an informal neighborly conference about affairs of mutual interest to the small group of states in this area whose population and medical problems are similar.

The conference soon lost its character as a neighborly exchange of views, however. It drew representatives from more and more states, from Colorado and Montana to Michigan and Indiana, and eventually metamorphosed into the National Conference on Medical Service, which meets annually in Chicago at the time of the Conference on Medical Education and Licensure, which

serves a purpose far removed from that of the parent group.

The need has remained, however, for precisely the type of informal organization contemplated by the founders.

In point of fact, the need for such a conference is even more acute than ever in view of events in Washington. Legislation has been introduced which requires the best thought and the most effective action of physicians to direct or adjust it, as the case may be, in conformity with interests of good medicine.

The ease with which some unwise legislation has become law of late (notably the bill permitting chiropractors to treat injured federal employees under the United States Employment Compensation Board), points to the need for efficient action. Such action may well be given direction and effect through the concerted endeavor of small groups such as this conference would provide.

The situation was presented recently to the Council and that body accordingly authorized the invitation for a new Five State Regional Conference to be held at the Lowry Hotel in Saint Paul on November 8. Wisconsin, Iowa, North and South Dakota, with Minnesota, will be represented. The new conference will be held strictly to the idea of the first planners. It will be a regional conference in fact, and it is hoped that out of it may come an effective instrument for action and exchange of opinion among kindred states.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

J. F. Du Bois, M.D., Secretary

Ex-Chiropractor Pleads Guilty to Criminal Abortion in Saint Paul District Court

Re: State of Minnesota vs. Peter J. Stolurow, also known as Dr. Stoll.

On September 29, 1942, Peter J. Stolurow, forty-seven years of age, 2256 Sargent Avenue, Saint Paul, pleaded guilty in the District Court of Ramsey County to an information charging him with criminal abortion. Stolurow stated to the Court that his brothers and sisters and his family are all residing in California, and that he desired a chance to leave the State of Minnesota permanently. He frankly stated to the Court that it was impossible for him to keep out of the abortion racket in Saint Paul because of his general reputation for doing criminal abortions. He stated that he could be gainfully employed outside of the State at a law-abiding occupation. After a thorough consideration of the matter, the Honorable James C. Michael, Judge of the District Court, sentenced the defendant to a term of not less than two, and not more than eight years at hard labor in the State Prison at Stillwater. The sentence was suspended upon condition that the defendant

1. Immediately depart from the State of Minnesota;
2. That the defendant do not return to the State of Minnesota for any purpose whatsoever.

The defendant, who formerly was licensed to practice chiropractic and chiropody in the State of Minnesota, has a long criminal record. On April 11, 1928, he pleaded guilty to a charge of criminal abortion and was sentenced in the District Court of Ramsey County to a term of four years in the State Prison at Stillwater, serving over two years of this sentence. On April 15, 1935, the defendant pleaded guilty in the District Court of Ramsey County, to practicing medicine without a license and received a suspended sentence of one year in the Saint Paul Workhouse. On May 19, 1941, the defendant pleaded guilty to a charge of practicing healing without a basic science certificate, and paid a fine of \$250. The same day he also pleaded guilty to a charge of endangering the life of a minor and was sentenced to one year in the Saint Paul Workhouse. After serving five months he was released by the State Board of Pardons. Stolurow's basic science certificate, chiropractic license and chiropody license were revoked in 1935.

While the Minnesota State Board of Medical Examiners does not feel that there is anything about the defendant's record that entitles him to any leniency, nevertheless, the Board does concur in the opinion expressed by Mr. James F. Lynch, County Attorney of Ramsey County, that the community will be far better off during the absence of the defendant than it could possibly be by having him in the city. If the defendant violates the terms of his suspension of sentence, he will be immediately arrested and required to serve his sentence of not to exceed eight years in the State Prison.

BABIES, MOTHERS AND WAR

War is the great enemy of the home. For the home is inseparable from the family. The preservation of both is essential in the maintenance of morale. Now that we are organizing an army of millions, home and family are called upon to make sacrifices. Young married men must leave the fireside to fight for what they hold most precious, and, often enough, wives who are about to become mothers—wives whose plight is pathetic partly because they are too inexperienced and too poor to care for themselves, partly because from one-third to one-half of our doctors must join the colors, partly because the maternity wards of hospitals are already overcrowded.

A problem which was acute even in peace is accentuated by the exigencies of war. Fortunately the Children's Bureau of the Department of Labor under Miss Katharine Lenroot's able direction has done notable work in assisting State health agencies. The sum allotted for the fiscal year 1943 is only \$198,000—obviously far too small. The Maternity Center Association has stepped into the breach. For ten years it has done its best to make the entrance of infants into this world a safe and happy event. Its Lobenstine School, the first of its kind to train nurse-midwives, has sent its graduates to almost every State and even to far-off China. Though its budget cannot stand the strain, it has now taken over the Berwind Free Maternity Clinic, formerly operated as a teaching center for medical students by New York Hospital. So insistent are the demands of mothers-to-be in these critical times that financial considerations had to be abandoned in the hope that the public would make good a budgetary deficiency and thus endorse an expansion which is indispensable.

Hard as it is to pay taxes, buy defense bonds and support charities that have a legitimate claim on our purses and our hearts, there is no task more urgent than that which confronts the Maternity Center Association. Every dollar contributed to its fund is a dollar that will help to safeguard mothers and babies in the most trying days of their lives.—Editorial, *New York Times*, June 2, 1942.

INDUSTRIAL HEALTH

WORKER FATIGUE

The fatigue problem in industry assumes a great importance as war production steps up to unprecedented levels in the United States today.

Results of extensive studies and comparisons, reported in *War Medicine* recently by Dr. R. R. Sayres of the United States Public Health Service, have shown clearly that fatigue is not solely the result of work done. It is also dependent on the worker's susceptibility to fatigue, a fact which varies from man to man and in each individual from day to day.

These findings are gathered from studies made over a long period in many large industries, and most impressive among conclusions drawn from them is the universal truth that the better the working conditions are, the greater the production will be and the smaller will be the costs due to accidents, absenteeism, turnover and compensation payments.

Plant Physician Responsible

Reduction of fatigue so far as the plant is concerned is a matter, in most instances, of introducing rest periods, of keeping working hours within reasonable limits with one day's rest in seven, and of good work conditions, including good lighting, heating and ventilation, and adequate plant medical service.

There are great advantages, measured in terms of production and of lowered costs, in supervising the living conditions of workers at home, as the experiment carried on over a period of years by the St. Joseph Lead Company has shown. The St. Joseph Company undertook to provide the kind of homes and advantages which would permit all of their workers to raise families satisfactorily and to send their children to good schools. The return in reduced turnover alone showed a clear profit. But that kind of worker-protection is largely out of the question during wartime. At the same time, plant precautions against overwork and ill health are more essential

than ever and should be part of the responsibility of every physician who in any way serves the industrial effort.

Rest Periods Increase Production

The importance of rest periods during necessarily long working hours has been thoroughly demonstrated. The fact is that rest periods will be taken, whether or not, during long spells of work and no discipline can eliminate the effects of fatigue. But rests sanctioned by the manager have been found to have far greater recuperative effect than those taken surreptitiously by the workers. Also, involuntary rests due to breakdowns or to inadequate supplies are apparently only one-fifth as valuable in relieving fatigue as voluntary rests.

Among experiments cited to substantiate these observations is one undertaken by an Eastern textile mill. Employees were given 40 minutes a day to be taken in four regular periods in which they were to lie down and rest. Spinning mules were shut down completely during the ten-minute periods but, in spite of that, production was up 10 per cent in a month.

Personal susceptibility to fatigue is determined by four factors as shown in these studies: the individual's constitution, his habits of muscular use, the environment under which he works and the nature of his task. A man's constitution may vary; it may be weakened by disease and strengthened by adoption of good habits of living. For a given task he may have formed habits that use more movements and keep his muscles under greater strain than are demanded by the nature of the work. Rhythm is a fundamental property of the nervous system and the building up of a series of rhythmic reflexes with no unnecessary movements is a potent factor in preventing fatigue. Unfavorable environmental factors include poor ventilation, excessive temperature and humidity. The nature of the task is an important

I'M IN THE AIR CORPS NOW

CAPTAIN C. KENNETH COOK, M.C.

9th A.F.S.C., Patterson Field

Fairfield, Ohio

The article "I'm in the Navy Now," by Lieutenant Commander Edward Dyer Anderson, which appeared in the June, 1942, issue of MINNESOTA MEDICINE, has prompted me to submit a similar viewpoint from the Medical Department of the Air Corps in the hope that it might hold some interest for those who may contemplate service in this branch of the armed forces.

I am a novice at this game as are the majority of the men who are associated with me. We have, however, learned a great many things that concern the Medical Officer assigned to the Air Corps.

Having applied for service with the Medical Department of this Corps and presuming that things at home have been made partially ready for the day when orders are to be received, let me start from the day when orders arrive, assuming that you have passed your physical examination Form 63, and have made application for a commission in the Medical Department of the Air Corps.

A preliminary notice of commission will arrive with the probable date of orders and the name of the field to which you will be assigned. Within a few more days the orders will be received and about ten to fourteen days in advance of the effective date for your reporting to active duty.

Now come decisions that you will be forced to make for yourself hurriedly and, I hope, correctly. First, do not plan on bringing your wife or family. Leave the furniture, for you will find that suitable quarters are few and far between, and after they have been located you can transport the things that have been left behind. Bring your car for you may find that eventually you may have quarters fifteen to thirty miles from the field. You will be able to share rides at times and transportation facilities are already overtaxed. Your car may have to be disposed of at a later date rather hastily, but as a rule, this has not been a major problem.

Travel light for most of your civilian belongings have no place in this branch of the service. Underwear, pajamas, handkerchiefs, razor, shaving soap and brush, toothpaste and brush, comb and brush, soap, pen and pencil, and such are the only necessities that you will have that can be used.

When you arrive at the field you will be stopped by the civilian guard at the gate and upon showing your orders will be directed to Headquarters.

At Headquarters you will be given the following list of procedures to carry out and while these will vary with each field, they are in general as follows:

1. Sign the register at Headquarters.
2. Report to Chief Clerk and fill out officer's personal data sheet.
3. Report to Post Adjutant with copy of orders assigning you to the post.

4. Report to mailroom requesting assignment of mailbox.
5. Report to identification unit for identification badge.
6. Report to Finance Officer.
7. Report to Civilian Guard House for auto identification tag.
8. Report to organization to which you are assigned for duty.
9. Report to hospital for immunization register.
10. Read and initial Officers' Bulletin Board at Headquarters daily at specified time.

Now that you are officially in and assigned you will be given time to locate living quarters. This may prove to be a great problem. Eventually, with all the help you can get from your fellow officers, you will succeed in finding something, probably not what you had hoped for, but something that will do.

Your assignment to new duties which have been arranged for you will follow. These may bear some similarity to something that you have done previously, but the chances are that they will be entirely foreign to any personal experiences.

You will find your superior officers kind, courteous, willing and ready to give you advice from their own information or experience. The new associates you will have are men from all specialties, groups, and sections of the country and are more or less confused at all of the new activities and duties that have been assigned to them. You will have to be photographed and fingerprinted for a pass from the Adjutant General's Office, the local field pass, and for officer's files. There are blanks for "dog tags," officer's qualifications, various data sheets, travel and uniform allowances, transportation or storage of furniture, and vouchers to sign to put you on the payroll.

These are just some of the things that unravel as you go along and are mixed in with various shots of typhoid, tetanus, cholera, plague, yellow fever, blood typing and smallpox vaccination. In case you get to feeling too well, these tame you down again.

While personal qualifications and professional ones are taken into consideration, you may find that an obstetrician or pathologist is doing physical examinations; a surgeon may be in charge of a venereal treatment and prophylaxis station, and so on. After all, we are all primarily M.D.'s.

Men who are not placed directly on the hospital staff or examining unit may be sent to school locally or to some other field for a special course of instruction. Local training usually consists of a course of Medical Administration and the various and sundry records that are involved. Courses to familiarize you with map reading, field administration, first aid, gas masks and the various gases and their smell, behavior, duration, etc.; the service pistol, its use, construction and operation; field sanitation and the means of carrying it out in different forms and under various conditions; routine inspections of health and of sanitation and dozens more; also a moderate amount of drill.

A certain number of men upon completion of this

training are assigned to Air Depot Groups which are in reality complete portable hangar service for combat planes. They consist of Headquarters, Supply and Repair Sections and have complete Medical and Dental, Mess and other groups to make them self-supporting and self-contained units of from eight hundred to one thousand men. The purpose of these groups is to service, repair, salvage, and maintain all types of aircraft, and to keep both men and planes at a peak for continuous and efficient operation.

You will soon become impressed with the magnitude of the whole situation and the very small tooth that you are in one of the numerous gears that operate this immense machine. Financially it is not what you have probably had before, but when you consider that you and your many associates are doing the best that you can under situations that may be far from ideal, most of which have little or no bearing on any previous experience, there is really definite satisfaction in knowing that we are each trying to keep our men the best Flying Force in the world and to "Keep 'Em Flying."

Personal ties are few and when you get out of line you hear about it so that you do not violate regulations again. Ignorance is not an excuse. Your superior officers are men who have been through the same thing or are more experienced. Coöperation is splendid. Complaints are few. Work is hard, interesting, new, voluminous and regular. Results are what count *and we do the best we know how*, with what we have on hand; smile, laugh and do today's job as fast and well as we can.

Ours is a small part in the big job of winning a war and we *must*, and we *will* "Keep 'Em Fit to Keep 'Em Flying."

NOTE: Opinions and material in this are my own and are in no way to be taken as having any official expression of the Air Corps. Released for publication by the Bureau of Public Relations, War Department, Washington.

WOMEN IN THE WAR EFFORT

A protest against the employment of expectant mothers in war industry is voiced in the October issue of *American Journal of Obstetrics and Gynecology*. "Recent promulgations from official sources indicate a necessity for this enlistment of women in war industries," comments the *Journal* in its Article, *Women in the War Effort*. "The results of their labors seem to have proved of great value and their induction into factory and similar employment is believed to release many men for the combat forces. If this constitutes a part of the necessary effort to win the war, we should accept it. In doing so, however, we must divorce from the movement any possible underlying element of glamor and choose as participants those women whose entrance into labor would not disrupt their obligations towards society and the family . . ."

The plan of encouraging mothers to stick to their job by providing for their special care in the factories is condemned as follows: "Why should pregnant women be employed at all in hazardous occupations or any

others that make demands on physical resources which should be devoted to carrying out her foremost obligation to society? For years we have been developing methods to protect her during this all-important period, and now we are urging her to expose herself to a possible interruption of her child-bearing function.

"This war is defined as a total war. Consequently it includes everyone, perhaps indiscriminately, including men, women and children. In our efforts, however, to bring it to a successful conclusion, we must weigh carefully what each group can do to achieve that end and in the meanwhile to preserve, so far as woman is concerned, her particular function in our social economy. This applies above all to her place as an expectant mother. *Pregnancy may eventually prove more worthwhile than making bullets*. Whatever problems may be involved, they demand attention and the possible solution must be based on reasoned study and not hysteria. Physically-fit women, married or unmarried, and free from family ties, should, in our vast population, be found in sufficient number to rule out a resort to pregnant women in our expanded program of war industry."—*Briefs* (Maternity Center Assn., New York), October, 1942.

SELECTIVE SERVICE EXAMINATION REVEALS LESS ALCOHOLISM

It is encouraging news to everyone who enjoys spiking the "decadent democracy" arguments of the Axis, that only twenty-one men out of 19,923, or 1.1 per thousand were rejected for acute alcoholism under the selective service system, stated James H. Oughton, head of the alcoholic research bureau of The Keeley Institute, Dwight, Illinois.

It is good news, says Oughton, because Keeley statistics, based on a half million patients treated during the past sixty-five years, when this "decadent democracy" built up the West, laid the railroads, won the Spanish-American war, and helped win the last World War, show that the national average for alcoholism was even higher than it is today.

But lest Americans grow too cocky over the sobriety record of their fighting youth, Mr. Oughton offers the following sobering reminders:

Keeley Institute research reveals that to two people in every hundred, even one drink is as disastrous as a lighted match to tissue paper.

The selective service average for inebriety is lower than that of the national average because the typical alcoholic has been drinking steadily for ten years. Alcoholism, on an average, evidences itself among men in the thirties, forties and fifties. Physical examinations of men under selective service applied to younger groups.

Fourteen men per thousand were rejected under selective service for kidney trouble, and 100.4 per thousand for heart disorders. Indulgence in liquor is probably responsible for some of these cases, said Oughton as well as some cases of gall-bladder trouble, indigestion, nervousness, and insomnia.

In Memoriam

GEORGE F. BROOKS

Dr. George F. Brooks, well-known eye, ear, nose and throat specialist in Saint Paul and lately of Stillwater, died October 7, 1942, at his home at Marine after a lingering illness. He was sixty-four years old.

Dr. Brooks was born in Brownsville, Minnesota, March 23, 1877. After attending Shattuck Military Academy he received his medical degree from the University of Minnesota in 1900. Following graduation he practiced in Hibbing. After serving in the Medical Corps of the army during World War I he took post-graduate work in eye, ear, nose and throat in Chicago and was associated with Dr. Frank E. Burch in Saint Paul. In 1932 he moved his office to Stillwater where he was a member of the staff of the Lakeview Memorial Hospital. He lived at Marine-on-the-St. Croix. He is survived by his wife, Margaret.

During the past ten years Dr. Brooks was several times president of the Washington County Medical Society. He was known to his associates as a clean-cut gentleman whose honesty was never questioned. What more can be said of a man?

LAWRENCE F. EDER

Dr. Lawrence F. Eder, a native of Blue Earth, Minnesota, died October 11, 1942, at his home in Santa Barbara, California, at the age of forty-two. Dr. Eder graduated in 1924 from the University of Minnesota Medical School and had attained prominence as an obstetrician and surgeon. He had many friends and acquaintances in Minnesota.

EDWARD P. HAWKINS

Dr. Edward P. Hawkins of Montrose, Minnesota, was born in Hancock County near Carthage, Illinois, August 9, 1863, the son of William R. and Julia (Wright) Hawkins. At an early age he came with his parents to Carver County, Minnesota, and attended nearby public schools.

In 1887 he graduated from Battle Creek College at Battle Creek, Michigan, and on January 15, 1889, married Vesta D. Miller, a college classmate. After three years during which he and his wife taught school he studied medicine at the University of Michigan where he received his medical degree in July 1, 1897.

In October, 1897, Dr. Hawkins located at Montrose. As his practice grew he established a hospital there in 1903. This was incorporated into a training school for nurses in 1914.

Dr. Hawkins was an earnest Christian and being a strong believer in prayer he on occasion offered prayer for grace and guidance before performing an opera-

tion. This brought assurance to his patients in their hour of trial.

Since 1920 Dr. Hawkins has spent his winters in Miami, but always looked forward to returning each spring to his home and garden in Montrose.

A year ago Dr. Hawkins suffered a severe heart attack and in spite of spending the last winter in Florida did not fully recover. The end came on September 28, 1942. He is survived by his wife; a daughter, Mrs. E. F. Willett of Mt. Vernon, Ohio; two grandsons, Edward Ferrand, Jr., and Robert Lee Willett; one sister, Mrs. Martha E. Fuller of Long Island, Alabama; and a brother, Grant Hawkins of Lodi, California.

SHERMAN SEDGWICK HESSELGRAVE

Dr. Sherman S. Hesselgrave was born in Sibley County, Minnesota, January 18, 1872. His father, Robert V. Hesselgrave, and his mother, Amanda Livingston, came to Minnesota from New York and settled on a claim near Arlington, Minnesota, in 1854.

Dr. Hesselgrave attended the Jefferson School and the Central High School in Saint Paul and graduated from the Medical School of the University of Minnesota in 1894. He, along with Dr. Sherwood, took their internships at St. Joseph's Hospital, following Dr. Harry J. O'Brien who was the first intern in the hospital. In 1897 he married Marie Elizabeth Greget. Dr. and Mrs. Hesselgrave visited her native France and other European countries in 1908.

Dr. Hesselgrave was on the staff of the Luther Hospital which was later known as the Saint Paul Hospital, where he collaborated with the late Dr. Eduard Boeckmann in perfecting the transverse abdominal incision. The subject was written up as "Rational of Transverse Abdominal Incision" by Dr. Hesselgrave and published in the *Saint Paul Medical Journal* in December, 1910. Dr. Hesselgrave at one time was also on the staff of the Midway Hospital.

During World War I he served as Lieutenant in the Medical Corps of the United States Army. After the war he received a commission in the Reserve and was commissioned Lieutenant Colonel in the Reserve in 1932.

In 1936 Dr. Hesselgrave moved his office from the Lowry Building to his home. Since that time he had served as a medical officer in a CCC camp for six months and practiced at Remer for some time. He also spent a winter in Babson Park, Florida, where he looked after his citrus grove which had been his hobby for twenty years. In 1941 he resumed practice in Center City, where he lived at the time of his death.

Dr. Hesselgrave was a member of the Ramsey County Medical Society for forty-three years and of the Minnesota State Medical Association for forty-five years. He

IN MEMORIAM

was a Mason and also a member of the Central Presbyterian Church in Saint Paul. Hunting and fishing were his best loved pastimes. He is survived by his wife and one sister, Mrs. H. L. Bullis of Oceana, Virginia, and a nephew, Richard Hesselgrave of Saint Paul.

EDWARD LEROY KANNARY

Dr. Edward LeRoy Kannary of Saint Paul died September 23, 1942, at St. Luke's Hospital following a comparatively short illness.

Dr. Kannary was born in Greenvale, Minnesota, on March 11, 1872, the son of Michael Kannary and Lavina Bates Kannary.

He attended the country school adjoining the farm and received his high school education at Northfield. After spending three years at Carleton College, he entered the University of Minnesota, where he graduated in 1897. That same year he enrolled at McGill College of Medicine in Montreal, Canada, and received his degree in medicine in 1900, completing the four-year course in three years.

Following graduation, due to his high scholastic record, he received an appointment as physician and surgeon on an ocean liner where he served two years on trips through the Orient. He then took six months' postgraduate work in Vienna, specializing in diseases of the skin.

In 1904 Dr. Kannary located in Saint Paul where he was always regarded as one of the leading practitioners in his chosen specialty. Two years later he married Cathrine Butler, who survives him.

Besides membership in the Ramsey County Medical Society, the Minnesota State and American Medical Associations, he was a life member of the Saint Paul Athletic Club, and served efficiently as president of the Town and Country Club, being very active on the Board of Directors for eight years.

As hobbies he thoroughly enjoyed hunting and golf, not so much for the sport itself as the pleasure he derived from association with his friends.

Ever cheerful and cordial and gifted with a very unusual wit, his presence was always felt in any gathering at any time.

—C. G. PERRY, M.D.

CHARLES W. MECKSTROTH

Dr. C. W. Meckstroth of Brandon, Minnesota, died at his home October 4, 1942, after being confined to bed following a stroke suffered in January, 1941.

Dr. Meckstroth was born in Le Sueur, Minnesota, September 7, 1872. After graduating from high school in Le Sueur he attended Hamline University and later the University of Minnesota Medical School where he graduated in 1895.

He began practice at Evansville but moved to Brandon in 1901 where he practiced continually until his illness in January, 1941.

On September 20, 1899, Dr. Meckstroth married Lottie C. Johnson. He is survived by his widow and

a son Orrin of Hawley, Minnesota. A daughter, Eunice Mildred, died twelve years ago.

Dr. Meckstroth held several offices of trust in Brandon, having been postmaster for a number of years and also a member of the school board. He was a member for many years of the Park Region District and County Medical Society and the Minnesota State and American Medical Associations.

STEPHEN WALTER RANSON

In the passing of Dr. Stephen Walter Ranson on August 30, 1942, at Chicago, neurology in the United States suffered a major blow and the pioneer tradition in medicine in Minnesota sustained a loss which it could not well afford. Dr. Ranson, a pioneer in certain aspects of American neurology, was the son of the first physician to settle in Dodge Center, Dr. Stephen William Ranson (1843-1904), who came to that railway village in June of 1870, and lived there for the rest of his life. He was a fast friend of such eminent Minnesota pioneers in medicine as Dr. Justus Ohage (1849-1935), Dr. William H. Mayo (1819-1911), Dr. Perry H. Millard (1848-1897), Dr. James Henry Dunn (1853-1904), Dr. Frederick A. Dunsmoor (1853-1930), and scores of others famous in the annals of medicine in Minnesota. The son was born there on August 28, 1880, and grew to manhood there. He received the degree of Bachelor of Arts from the University of Minnesota in 1902, that of Master of Science from the University of Chicago in 1903, that of Doctor of Philosophy from Chicago in 1905, and that of Doctor of Medicine in 1907. From 1904 to 1906 he was a fellow in neurology at the University of Chicago; in 1907 and 1908 he served his internship in the Cook County Hospital; in 1909 and 1910 he was an instructor in anatomy, from 1910 to 1912 he was assistant professor of anatomy, and from 1912 to 1924 he was professor of anatomy and chief of the department, in the Northwestern University Medical School. From 1924 to 1927 Dr. Ranson was professor of neuro-anatomy and histology in the Washington University School of Medicine in Saint Louis; but in 1928 he returned to Northwestern as professor of neurology and director of the notable Neurologic Research Institute of that university, a post which he occupied at his death. An editor of the *Archives of Neurology and Psychiatry*, Dr. Ranson also had written much on neurology. He was particularly interested in research concerning the structure and functions of the peripheral nervous system and of the hypothalamus. In 1929 the Stephen Ranson Lectureship in Medicine was created to honor him at Northwestern University. In 1936 he was the Harvey lecturer before the Harvey Society of New York, sponsored by the New York Academy of Medicine. He spoke on December 17, 1936, on "Some Functions of the Hypothalamus." One of his best-known works was his *Anatomy of the Nervous System*, published in seven editions, which he was revising at his death. He had contributed more than 160 papers to medical literature. He was a member of many scientific societies, including Sigma Xi, Association of American Anatomists (of which he was president from 1938 to 1940), American Association for the Advancement of Science, American

IN MEMORIAM

Physiological Society, and the Association for Research in Nervous and Mental Diseases. The 1940 volume of the last-named society, *The Hypothalamus and Central Levels of Autonomic Function*, was dedicated to Dr. Ranson.

On August 18, 1909, Dr. Ranson was married to Miss Tessie Grier Rowland, of Oak Park, Illinois. Several children were born to them.

Dr. Ranson died in Chicago, of coronary thrombosis, on August 30, 1942. Funeral services were held at the Fourth Presbyterian Church in Chicago on Tuesday, September 1, 1942, in the course of which Dr. James Roscoe Miller, dean of, and associate professor of medicine in, the Northwestern University Medical School, observed: "As one of a group of friends and

colleagues who have had the rare privilege of his friendship, company, and counsel; as an acquaintance of the family, I have had the opportunity to know and to admire; as one of thousands of students to be found in every quarter of the globe who have knelt at his throne; as a representative of a University made infinitely greater by his having been a member of its faculty, and, lastly, I speak for all mankind and for those who are to follow through the ages in expressing our gratefulness for what this Great Man has given us."

A sister, Dr. Mary Eliza Ranson (Mrs. A. Franklin Strickler), of Sleepy Eye, Minnesota, and Long Beach, California, survives him. A brother, Dr. George Ranson (1871-1899), died at Saint Peter in 1899, in the course of active practice.

SUICIDE AND WAR

Along with its unspeakable evils, war does beget some changes which have a beneficial aspect. Some of these are essentially material—technological advances hastened by the pressure of urgent necessity, surgical and medical progress at an accelerated pace in the face of terrible emergencies of the battlefield. Less obvious on the surface, though striking deep, are new reactions in mind of a certain type. It is a commonplace in mental hygiene that it is healthy for the individual to forget himself by immersion in issues transcending his own petty, personal complaints. So comes about the singular paradox that in times of war a symptom of worry, discouragement, and despair—suicide—is actually found to become more rare than in peacetimes. Not only various national figures, but the records of the Metropolitan Life Insurance Company as well, show the evidence.

The death rate from suicide among the Company's policyholders this year is practically the same as last year's figure, and is with one exception the lowest on record. For 1941, as a whole, the rate dropped sharply from the preceding year. This phenomenon of an exceptionally low suicide rate is attributable largely to the psychological effect of the war, although the increased standards of incomes have contributed a share. A similar low level of suicide mortality is observed in England, where the rate fell consecutively from year to year between 1939 and 1941, and where the 1941 suicide rate among males was approximately 15 per cent below that of 1939. Also, there was a sharp fall in the number of suicides in the last three months of 1939, which in England marked the opening period of the war. Recent German figures also show a fall of 30 per cent from 1939 to 1941 in the suicide rate.

This decline in suicide during wartime has been observed in practically every country at war, and it is a rather curious fact that, in some instances at least, neutral nations neighboring on the belligerent countries shared in this same phenomenon. As for our own experience in the last war, not only was there a decline of 20 per cent between 1917 and 1918, but the downward trend began in 1916 and continued through 1920. Between 1915 and 1920 the decline was more than 50 per cent. While there was some rebound from these low levels after the war, the suicide rate has never returned to its pre-World War level, not even during the economic depression in the 1930's.

The lowering of the suicide rate in war is so marked and so universal that the list of instances could be lengthened considerably. The interest, however, is not in such a list of figures, but in the evidence which they bear of one favorable psychological effect of war. A national clamor acts as a uniting force. The needs of the country become of paramount importance, and the petty interests and difficulties of the individual tend to be forgotten in the urgent desire to aid the Nation in a time of crisis. Many sensitive individuals whose lives seem to lack purpose become absorbed in rallying to the defense of their country. Men live for the present and worry less about the future, especially as, during war, new channels of activity are opened. The demands of the military forces for material cause a sudden spurt in production and money incomes. Thus economic and psychological forces work together in the same direction for the benefit of the Nation's state of mind.—*Statistical Bulletin, Metropolitan Life Insurance Company*, Vol. 23, No. 9, September, 1942.

MINNESOTA STATE MEDICAL ASSOCIATION

Eighty-ninth Annual Session

June 28, 29 and 30 and July 1

Duluth, Minnesota

HOUSE OF DELEGATES

Sunday, June 28, 1942

The first meeting was called to order at 2 p.m. by Speaker W. W. Will.

Following a report from Dr. E. C. Bayley of Lake City, chairman of the Committee on Credentials, that a quorum was present, it was moved, seconded and carried that the reading of the minutes of the last meeting be dispensed with and, at the request of the Speaker, Dr. Gunnar Gundersen, president of the Wisconsin State Medical Society, addressed the delegates.

DR. GUNDERSEN: It is very interesting to note that your problems are very much the same as ours are in the neighbor state. We have the same type of background, we are interested in the same things and have more things in common than the adjacent states of Michigan, Illinois and Iowa. There has always been a healthy spirit of cooperation and competition between us, especially since the time eight years ago, when your president, Dr. Coventry, was from Duluth and our president was from Superior. I bring the greetings of your sister society and best wishes for the success of your association and this meeting.

The Speaker then called on Dr. S. E. Gavin of Fond du Lac, chairman of the Council of the Wisconsin State Medical Society.

DR. GAVIN: For many years I have heard about the organization in Minnesota and I believe we have adopted many of your streamlined procedures in the conduct of our society. There is no question that we have many things in common. According to the last AMA directory you have about twenty-five more licensed physicians but about 200 more members so you undoubtedly have something on the ball that gets you this increased membership which we have not as yet attained. In matters of legislation, medical economics and social relations we both probably follow along much the same paths. It is perhaps more important right now for men to be on the alert than at any other time in our history. We have been involved in handling legislation that is more radical, I believe, than any presented in Minnesota but the contact between the states is so close that such legislation may easily spread from one to the other.

There is little time during the war period for us to lay out the future of medicine when the war is over. We are completely concerned now only with winning the war. At the same time we must be on our guard. There are men and bureaus in this country whose ideas are not in the best interests of the medical profession and it does not require a great deal of discernment, in spite of assurances of men high in the government, to realize that plans are already taking shape to bring medicine under government control. With the undercurrent of hysteria which involves everything in these times it would take the merest spark to start a conflagration that would plunge us into types of state medicine detrimental to the welfare of the public as well as the profession.

Speaker Will called for the report of the Chairman of the Council, Dr. W. L. Burnap of Fergus Falls.

Dr. Burnap announced that he would dispense with the reading of the annual report already in the hands of the delegates and reported as follows on the Council meeting held in the morning of the same day:

REPORT OF COUNCIL MEETING

The bank balances for last year and the statement of budget expenditures was approved, the only change being an addition of \$1,000 to the budget of the Public Health Education Committee to cover unexpected additional expense for the packet-of-the-month program which has doubled in demand from the membership this year. Also additional funds were allowed to cover expenses of delegates to the Atlantic City meeting of the AMA.

Certificates and lapel buttons for the Fifty Club (to be inaugurated at the banquet Tuesday night) were approved.

A gratifying increase in the amount of vaccine and toxoid distributed throughout the state was reported by Dr. A. J. Chesley, secretary and executive officer of the State Board of Health.

At the request of Dr. V. O. Wilson of the Division of Maternal and Child Health of the State Board of Health, the Council appointed a committee consisting of Dr. R. L. J. Kennedy of Rochester, chairman of the Committee on Child Health, Dr. R. J. Moe of Duluth, Chairman of the Committee on Maternal Health, and Dr. E. J. Simons, Chief of the Medical Unit of the Division of Social Welfare and Dr. W. A. Coventry of Duluth, chairman of the Committee on Low Income and Indigent Problems, to confer with Dr. Wilson and report at a subsequent meeting on the program proposed by the Children's Bureau for medical hospital obstetrical and pediatric care for wives and children of men in military service.

The annual complete report of the activities of the State Board of Medical Examiners was presented to the Council by Dr. A. W. Adson of the board. This report is on record in the State Office and may be examined by any interested member.

All physicians owning diathermy machines are required to register them with the government on a blank which can be secured from the Federal Commission at the old Post Office building in Saint Paul. This matter was brought to the attention of the Council and is now transmitted to the delegates at the request of the Council.

Other routine business included approval of mail votes by the Council, of cooperation in the continuation course on Child Health at the University Campus in which the Committee on Child Health acted as sponsor and many representatives of component societies attended; acceptance of affiliate memberships for Drs. H. J. Lloyd, Mankato; R. L. Windsor, Fergus Falls; G. F. Reineke, New Ulm; C. E. Johnson, Pine River; J. D. Watson, Minneapolis; invitations to two national associations, the American Association of Mental Deficiency and the American Society of X-Ray Technicians, to meet in Minnesota.

The most important discussions and action taken by the Council at this meeting involved the question of dues for men who have gone into active military service. Upon motion regularly seconded, a committee consisting of Drs. A. W. Adson, L. A. Buie, S. H. Baxter and F. J. Elias, was appointed to embody the conclusions reached as a result of these discussions in a resolution to be presented to the House of Delegates.

Permission of the Speaker to present this resolution for consideration of the House immediately was requested by Dr. Burnap.

The Speaker called for a resolution permitting the House to go into immediate session for new business. Upon passage of this resolution he called upon Dr. Adson to present the matter to the delegates. Dr. Adson reviewed earlier action by the delegates and the Council with respect to payment of dues for men in service. This action, in brief proposed to county and district societies that the societies pay dues of their own members if possible and if the members themselves could not pay their own dues. If the societies were unable to take such action, state dues of members below the grade of captain were to be remitted subject to approval in each case by the Council.

DR. ADSON: Many county societies assumed the burden of dues for their members in service but as more and more were called to active duty the burden became heavy for the larger societies with larger dues to assume. Furthermore, many men in the service felt that their dues should be remitted in that colleagues at home would inevitably profit by increased practice in their

absence. Also the majority of other state associations were following the policy of remitting dues for all who enter military duty regardless of rank.

It is obvious that waiving of dues for all men who go into service presents a serious problem to the state association. Normally there are 2,700 dues-paying members in the association of whom more than 500 are now in service, with the prospect that approximately a third will be in service soon if demands for December 31, 1942, are met. Thus the annual normal income of the society is approximately \$37,000 and that income by December 31 will be cut by \$12,000 or more if dues are waived. The problem, then, is how to meet the annual budget, which averages about \$36,000. Overhead expense will be no less and may be more in view of some heavy additional obligations involved in Procurement and Assignment work and in added war-time educational programs.

The question is, are we to continue as an active medical organization or are we to curtail our activities? To those of us who have sat in the House of Delegates of the AMA, it is increasingly clear that we are now out in front in Minnesota. We have accomplished something we do not want to lose. Furthermore, there is a constant threat to the practice of medicine. Evidence of projected new inroads from Washington is brought to us constantly. Organization to maintain the same active program and the same careful supervision is more necessary than ever before if we are to continue as a profession. We cannot reduce our budget and maintain the same sort of effective organization. It is true that there are a few paid employees such as our Executive Secretary but most of us give our time so that medicine may live when we are gone. We all hate assessments and we dislike paying dues; but we need money and what are we going to do? Throw it back on the county societies again? For rural societies the burden may not be great but for urban societies it is heavy. If we were chiropractors we would not hesitate to dig up fifty or one hundred dollars apiece to promote ourselves. But we do not ask so much. We need in fact no more than all of us spend many times for little extra luxuries.

You may ask why the additional funds could not be taken from our reserve. Well, our reserve fund now has a book value of \$44,000. If we assume the loss of \$12,000 this year and perhaps more next it will be but a short time until our entire reserve has vanished. And we are going to need that reserve if we are to meet the difficulties that are being shouldered onto the practice of medicine. The alternative which seemed best in the judgment of the Council this morning is embodied in the resolution which follows and I moved that it be adopted.

WHEREAS, due to the war emergency, the Minnesota State Medical Association faces the loss of approximately one-third of its membership and

WHEREAS, there has been no unanimity, based upon previous actions of the Council and House of Delegates, as to the manner by which this loss of income is to be met, Be It therefore

RESOLVED that, beginning with the year 1943, the dues of all members who enter the service of the armed forces shall be waived for the duration of the war emergency; that their status as members in good standing shall be retained for the same period, and

BE IT FURTHER RESOLVED, that a special assessment effective January 1, 1943, is hereby levied in the sum of \$5.00 per member per year during the war emergency.

Other members of the Council committee were asked to discuss the matter. Dr. Elias pointed out that dues of St. Louis County who have gone into military service have been paid by two assessments of members in spite of which there has been a deficit. He felt certain that St. Louis County members would not object to the state-wide assessment of \$5.00.

Dr. Baxter pointed out that the necessity for maintaining a strong state organization is increasing; that, even if it is necessary to curtail local activities, the state association must be maintained. Many local societies

that have remitted their own dues for their members in the services will be under a heavy burden. Nevertheless he believed that the resolution should be adopted to maintain the strength of the state organization whatever may happen.

Dr. Buie spoke on behalf of the special committee and also of the Finance Committee of which he is chairman.

DR. BUIE: If one-third of the paid membership should leave by January first, that would mean a loss of 846 members or \$12,690 in membership dues. If that amount is deducted from the current income of more than \$38,000, it will leave about \$25,000. But it costs the organization about \$36,000 a year to function and it is obvious that a budget of \$36,000 cannot be met out of \$25,000. There are lateral considerations which should be mentioned again. For instance there has been a little surplus above expenditures each year for the last few years. In 1940 the surplus was \$8,000; in 1941 it amounted to a little over \$2,000. Out of this accumulated income \$5,000 was invested in the reserve. There were many years during good times, however, when the association failed to accumulate any surplus whatever and the outlook for any such increase in the future is highly doubtful now.

With this addition from surplus revenue, we now have a reserve of about \$44,500 and, for that reason, many members have considered the financial position of the association to be impregnable. Some have even said that the reserve fund was too large, that it should be used immediately as soon as an emergency arose. But with an annual deficit of \$11,000 or \$12,000 or even of \$8,000 or \$9,000, provided some additional unforeseen income is found, the financial bulwark of \$44,500 will be dissipated within a few years unless this measure is adopted. The financial position of the association will then be in great jeopardy and the finance committee of the Council therefore sincerely hopes that the measure will be passed and that every delegate will undertake to explain the necessity for it to colleagues in his own society.

Dr. Burnap called attention to the fact that the additional income mentioned by Dr. Buie was derived from sale of exhibit space at the state meetings, that Mr. Rosell, executive secretary, had been very successful in making such profits from the last few meetings, but that large meetings with an extensive sale of exhibit space are probably a thing of the past. Thus it is impossible to count on this source of additional income.

Dr. Adson pointed out further that expenses are higher in alternate years due to the legislative program.

Dr. R. W. Morse of Minneapolis said that an additional assessment would have to be levied upon Hennepin county members to carry on their own county program and that the Hennepin county membership would undoubtedly ask to what extent economy in operation of association affairs could make up for losses and avoid the necessity of assessments.

DR. BUIE answered as follows: The Finance Committee of the Council has constantly and closely supervised the financial position of the association. It has been our continuous endeavor to practice economy in our program and in the office administration of our affairs. Our problem is that additional activities involving additional expense are constantly enforced upon us. It is our sincere belief that our overhead expenses are now reduced to a minimum and that there is no way to reduce them without curtailing or actually discontinuing essential parts of our program. As a member of the Finance Committee, I have been obliged to keep in very close touch with the situation and I speak with as much or more knowledge of it, perhaps, than other members of the Council.

DR. BURNAP commented as follows: We have had wonderful help all along the line of financing the state society. Mr. Rosell has unusual ability, Dr. Giffin has

checked carefully on things for years, we have committee chairmen like Dr. Buie and besides we have the help of reliable financial agents. All expenditures are carefully examined. Some which, like the packet-of-the-month, are increasing in cost, are regarded as one of the finest things undertaken by the State Association. Certainly we believe that the packet program should not be cut down. Furthermore, the prices of materials and many services has risen so that the strictest economy has been necessary to hold the costs within the budget adopted. In the opinion of the Council there isn't going to be any material reduction in the costs of carrying on the state society's work.

Mr. ROSELL: I think Dr. Morse should know that some projects of the association have been curtailed but that new ones have promptly been put in our laps to replace them. For example, the paper and administrative work of the State Committee on Procurement and Assignment has added greatly to our expense but the Council has expressed itself as unwilling to accept federal money to cover that expense. It is costing us considerable money but I believe all of the doctors of the state agree that they prefer to run this business of selecting physicians for the Armed Forces themselves without the aid of the Government.

Several delegates speaking from the floor expressed themselves emphatically to the effect that they did not wish the association to be paid by the federal government.

The resolution was passed unanimously by the delegates and it was also decided, upon motion of Dr. F. J. Savage of Saint Paul, that the resolution should be sent to the men in the armed services and published in MINNESOTA MEDICINE.

The Speaker then asked for action by the delegates on the report of the Chairman of the Council. It was moved, seconded and carried that the report be accepted.

The Speaker then called for the report of the Reference Committee on Medical Education Reports, Dr. F. W. Lynch, Saint Paul, Chairman. The following reports were considered:

COMMITTEE ON CANCER

The public education program of this committee continues to be carried on in cooperation with the Minnesota Society for the Control of Cancer.

During the past year the work of the society has branched out widely in all parts of the state. Lectures, exhibits, radio broadcasts and distribution of literature have characterized the campaign and its possibilities are limited only by funds and personnel available to carry on the work.

Great public interest is continually manifested in the possibilities of control of cancer and in the work of the organization and it is interesting to note that the simple questionnaire sent to members through the monthly News Letter of the association showed that a vast majority not only approve the cancer education program but profess to find more cancer patients coming to them early for diagnosis and treatment as a presumable result of the educational effort.

Cancer of the breast was chosen this year as subject-of-the-month for April to coincide with the annual membership drive of the Minnesota Society for the Control of Cancer. A packet of scientific material was prepared under auspices of this committee for distribution to physicians on request.

Headquarters of the society remain in the Lowry Medical Arts Building where offices were secured without rental through this committee. The chairman serves on the executive committee of the society and all educational undertakings are submitted to the committee for approval.

The Council has repeatedly approved the program and cooperation of all members in the work is urged.

M. W. ALBERT, M.D., *Chairman*

COMMITTEE ON FIRST AID AND RED CROSS

The Committee had its first meeting of the year on February 28 at the Lowry Hotel in St. Paul. The decisions of the Committee are as follows:

"The members of the First Aid and Red Cross Committee were unanimous in the belief that, because of the urgency of the present situation, they would follow the standard Red Cross First Aid Textbook in teaching First Aid.

"It was agreed also that, in order to avoid confusing the students, the book would be followed just as it is, without expression of the instructor's personal disagreement with the text.

"The instructor, it is believed, should avoid offense to any social or professional group.

"It was suggested that the physician be the executive officer, that he lay the plans and direct the course, that he personally give the primary instruction but that he utilize available persons in conducting the necessary drills.

"The medical profession is asked to make first aid training available to the hundreds who will be required to take it and to the thousands who will desire it. Air raid wardens, school bus drivers and victory aides are examples of persons who already are required to take it.

"The physician is best qualified of all persons in the community to direct the energies of the host of people who are insistent on giving their help. He need not fear that the entire burden will fall on his own shoulders.

"As a corollary of this, the physician may be sure that many organizations, the membership of some of which is composed of women, are eager to support his efforts. As an introduction to utilization of these groups, the physician should urge participation of the Woman's Auxiliary to the Minnesota State Medical Association.

"Obviously, in the development of the entire program, the prompt support of officers of county and regional medical societies is essential."

The Committee finds upon investigation that the members of the Minnesota State Medical Association are quite adequately supporting the efforts of the American Red Cross and the Office of Civilian Defense in the conduct of first aid classes. However, the Committee stands ready, at any time, and has offered their services to the various organizations that have need instructors in first aid.

On March 20 I went up to the Curtis Hotel in Minneapolis where I, as Chairman of the Committee, addressed the Board of the Woman's Auxiliary of the State Society and they in turn indicated their willingness to cooperate with the Committee.

As Chairman of the Committee, on April 14 I addressed the Blue Earth County Medical Society.

The Chairman of the Committee has broadcast ten times over station KROC in Rochester from the first aid classes which were conducted at North Hall in the Mayo Civic Auditorium. Considerable interest was aroused in the community. It is quite possible that such broadcasts could be carried out in other communities to advantage. However, they probably should be limited as there tends to be enough repetition so that they might become uninteresting if overdone.

The Committee, at the suggestion of Mr. R. R. Rosell, has applied for space at the Duluth meeting for an exhibit on First Aid and Red Cross and have received word that the Duluth Chapter of the American Red Cross will cooperate in this exhibit. It is intended that motion pictures will be shown bearing on the teaching of first aid and that as many members of the Committee as possible will attend the state meeting and take their turns at being present in the booth or room assigned to first aid. Dr. C. H. Mead, of Duluth, a member of the Committee, has been asked to make local arrangements in connection with the local Red Cross chapter.

An official meeting of the Committee will be held in Duluth on June 30 at which time plans for the Committee for the balance of the year will be formulated.

JOHN S. LUNDY, M.D., *Chairman*

COMMITTEE ON THE CONSERVATION OF HEARING

Interest in the all-out effort today transcends all other interests. Nevertheless your committee is able to report that in Minnesota there has been definite progress in the movement to conserve hearing as a part of the national health program. There is a better understanding of the problem. The larger possibilities of attainment in its solution are being more fully recognized by members of the medical profession, educators and social service workers. Increased hearing hazards incident to war and to the production of war materials in the heavy industries have stimulated unprecedented interest in prevention of avoidable hearing handicaps.

During the past year the number of audiometric tests among school children, college students and entrants in hospital training schools has materially increased.

A greater number of audiometers have been purchased, especially in larger communities, and more hearing-defective children have been discovered and given the benefit of corrective medical care and educational adjustment than in past years.

Lately there has been a noticeable improvement in the technique used in making hearing tests because of a wider use of the pure-tone or pitch range audiometers "accepted" by the Council of Physical Therapy of the American Medical Association for making screening tests for case-finding purposes. Individual tests by their employment yield more accurate results than tests made by instruments in which the fading voice reproduced by the phonograph, for simultaneously checking groups containing as many as forty persons.

Growing interest in the periodic testing of the hearing as a public health measure is shown by the fact that special courses on the conservation of hearing have lately been given jointly by the Department of Public Health and Preventive Medicine and the Division of Otolaryngology of the University of Minnesota.

It is hoped that similar courses will be offered by the teachers colleges as is done in several other states to meet a growing demand for trained audiometer technicians.

There is urgent need in Minnesota of an effective, competently supervised program for the conservation of hearing to be set up and administered by the State Board of Health and the State Department of Education working in closest cooperation.

The functions of each group should be clearly defined. Such a plan to be effective calls for wise legislation to provide the

necessary tax raised funds which it is hoped will be supplemented by generous grants by federal agencies as a profitable, long-term investment. Such a program will insure to the school child in impoverished rural areas as well as to the pupil in urban centers the benefits of modern preventive and corrective methods for safeguarding the hearing.

It is important that both the medical profession and our law makers recognize the fact that hearing-defective individuals should be placed on an equally favorable basis as those who are physically handicapped in other respects like those having visual, heart, locomotor and other bodily defects.

HORACE NEWHART, M.D., *Chairman*

COMMITTEE ON VACCINATION AND IMMUNIZATION

A special wartime effort to promote state-wide vaccination and immunization was undertaken under auspices of the committee, this year, in cooperation with the State Board of Health.

The program began in November, 1941, with radio and newspaper publicity in all parts of the state and an appeal by mail to all Parent Teacher associations, American Legion Auxiliary groups, public health nurses, school superintendents and others interested in public health.

Prompted in part by Minnesota's bad record for smallpox in 1940 and in part by the importance of protection against all epidemics as part of the national defense effort, the committee and the state health officials utilized every available means to reach the public with the imperative need for these accepted measures.

Two posters, one of them urging vaccination and the other immunization, were prepared especially for the campaign and were distributed widely over the state, together with small leaflets suitable for distribution at meetings and for mailing with statements. A total of 17,000 of these posters and 308,000 leaflets have been sent out by the state office in the course of the last six months.

As a result of all these efforts all counties in the state have reported some type of community immunization and vaccination program during the year and the amount of vaccine and toxoid distributed through the state department of health has exceeded all previous years. It is the hope of the committee that, with a steady continuing effort on the part of organized medicine, Minnesota may not only erase its former bad record, but virtually eradicate small pox and diphtheria from the state.

It is interesting to note that the annual May day child health program instituted by the Children's Bureau in Washington was devoted exclusively this year to vaccination and immunization and the proclamations on the subject from both the President and Governor Stassen no doubt gave an added impetus to the program of education already well established in this state. Copies of the proclamations were sent by the Board as part of the general educational program to all newspapers in the state.

The measure of progress in public health in any state is quite likely to be the extent and effectiveness of its program for control of smallpox and diphtheria. The energy and public spirit of the physicians are measured by the same yard stick. This committee, with the aid of the State Department of Health, is utilizing every means to reach both the public and the physicians to the end that the public health may be protected and that no reproach can be leveled upon medical leadership in Minnesota.

L. R. CRITCHFIELD, M.D., *Chairman*

COMMITTEE ON TUBERCULOSIS

Dates. The Committee on Tuberculosis held the following meetings during the year: August 21, September 25, and October 25, in the St. Paul Hotel. On November 27, the meeting was held in Litchfield, Minnesota, and on December 11 in Tyler, Minnesota. On January 29, 1942, the meeting was held in the St. Paul Hotel and on March 5 and April 23 the Committee met in the Lowry Hotel in St. Paul. Thus, there were eight regular meetings during the year.

Request of Council. At the August 21, 1941, meeting the Committee on Tuberculosis had a communication of June 17, 1941, from the Council of the Minnesota State Medical Association to the effect that the Committee make a careful study of the tuberculosis problem in Minnesota and formulate an adequate program for the control of this disease. The members of the Committee were cognizant of the great responsibility the Council had invested in them. They took the matter seriously and have since devoted a large amount of time to this work.

The tuberculosis problem has many phases which require study, such as incorrigible patients, control of the disease in personnel of school systems, detection of the disease among draftees, preparation of a pamphlet on procedures in diagnosis, treatment and prevention of tuberculosis for physicians, organization of a group of successfully treated patients, study of sanatorium facilities and standards, procedure for controlling tuberculosis in state institutions and an "all-out" campaign against tuberculosis.

Incorrigible Tuberculosis Carriers.—At the August meeting of the Committee the question of making provision for the incorrigible contagious case of tuberculosis was discussed. It was the consensus of opinion that tuberculosis cannot be controlled in the state of Minnesota as long as persons with contagious disease, who are not coöperative, are allowed to remain in their homes and mingle with others.

At the November meeting, Dr. Hilleboe pointed out that the State Sanatorium would be the logical place for incorrigibles and that Dr. H. A. Burns would be willing to undertake the care of this group of patients, provided special arrangements could be made for financing the necessary facilities and personnel. These persons must be kept under guard, preferably away from other patients; in fact, they must be treated almost the same as prisoners and, therefore, special provision should be made for them. Dr. Hilleboe was of the opinion that the State Department of Health is the logical unit to procure from the legislature funds for this purpose because under the present budget such arrangements cannot be made without depriving coöperative patients of the nursing and medical care they need.

Personnel of Schools.—The control of tuberculosis among the personnel of school systems has been highly developed in Minnesota by such persons as Drs. Lewis S. and Kathleen Jordan and Dr. S. A. Slater. The result is most gratifying, inasmuch as many school boards in this state now require adequate examinations of all persons seeking employment, including not only teachers but also bus drivers, janitors, engineers, et cetera.

This is a subject which the Tuberculosis Committee proposes to support in every possible way until all school systems of Minnesota are made safe for employees and students from the standpoint of contagious tuberculosis.

Examination of Draftees.—Because of the seriousness of the tuberculosis problem which developed among our service men during and after the first World War, which resulted in a cost of more than a billion dollars to the nation, the Committee manifested much concern over the present inadequate examinations of draftees. Tuberculin tests were not being administered routinely and x-ray films of the chest were not a part of the regular examination. It was the desire of Dr. Chesley that provision be made for adequate examinations for pulmonary tuberculosis of all draftees; therefore, the Committee passed a resolution to the effect that complete chest examinations, including the tuberculin test and x-ray films of the chest of every draftee who reacts, be given to all Minnesota draftees before they are inducted and also before they are discharged from military service.

Pamphlet on Tuberculosis for Minnesota Physicians.—At the October, 1941, meeting it was pointed out that the Committee had spent a great deal of time at its previous meetings on the discussion of standard and practical methods of diagnosis, treatment, and prevention of tuberculosis. It had selected the procedures most applicable to Minnesota upon which the Committee members had agreed. It was suggested that this material might be included in a pamphlet to be published in MINNESOTA MEDICINE and reprinted so that it would be available to all physicians of the state, as well as those of other states who requested it. The Committee voted unanimously in favor of this project. An outline was prepared and sent to each member of the Committee, and he was to complete it in the manner considered most suitable. These outlines were assembled and all suggestions and additions were incorporated. The manuscript was submitted again to the members of the Committee for any further suggestions, following which a final manuscript was prepared. It was then approved at a regular meeting of the Committee, after which it was sent to the Council. This body approved the manuscript and transmitted it to the Editing and Publishing Committee of MINNESOTA MEDICINE for publication. However, the latter committee rejected it with a statement that it was not suitable for publication in MINNESOTA MEDICINE. This communication was brought before the Tuberculosis Committee and referred to the Council. It was suggested by the Council that possibly the manuscript was too long and that most of the historical consideration should be deleted. This was done and the manuscript was again sent to the Council for any desired disposition. (This manuscript appeared in the October issue of MINNESOTA MEDICINE. Editor's Note.)

Former Patient Organization.—At the October, 1941, meeting it was suggested that an organization of tuberculous patients who have been successfully treated, and who wield considerable influence in their communities, might be of great value in promoting the tuberculosis control program throughout the state. It was pointed out that former patients are excellent educators and that they can often do more to promote a tuberculosis control program than professional workers. A number of prominent former patients have been interviewed and, without exception, they have expressed a strong desire to participate in every possible way in the tuberculosis control program. However, to date, no attempt has been made to effect the organization.

Study of Sanatoriums.—Minnesota has long been known to have one of the best sanatorium systems in the United States. Since the sanatorium is so important in the control of tuberculosis, it was thought wise to prepare a questionnaire to be sent to the Superintendents of these institutions. We desired to know when each sanatorium was opened, the capacity at that time, and the total cost of the plant. Since epidemiology of tuberculosis was instituted in connection with our tax-supported sanatoriums in 1931, we inquired as to whether if adequate epidemiological work were done in each of the sanatorium districts enough unsuspected cases of tuberculosis would be discovered to fill each institution to capacity. We also inquired as to whether epidemiological workers are provided for

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

each institution and if not, what the Superintendent would consider adequate in this respect. We were also desirous of knowing whether each sanatorium is adequately staffed. The questionnaires have been returned and the data will be analyzed by the Committee.

It was proposed at the October meeting that the Tuberculosis Committee make an annual inspection of each sanatorium with reference to standards of diagnosis, treatment, epidemiology, et cetera, as practiced in these institutions. It was further proposed that the Committee should recommend to the Council that the State Medical Association issue an annual certificate of approval to each institution meeting the minimum standard requirements. The function of the Committee would be concerned exclusively with professional operation of the institution and would not involve business administration or official relations in any way. The question arose as to whether the sanatorium superintendents would welcome inspections of their institutions by the Committee. Therefore, a questionnaire was mailed to each superintendent and the replies were unanimous in granting this permission; in fact, most of the superintendents stated that they would welcome such inspection at any time.

Control of Tuberculosis in Institutions for the Mentally Ill.—Although in 1898 Dr. H. M. Bracken wrote a classical article on tuberculosis in the institutions for the insane, no serious attempt was made to solve the problem until 1934, when Dr. H. A. Burns made an arrangement to administer the tuberculin test not only to the inmates but also to the personnel of our state institutions. Tuberculin reactors had x-ray film inspections of their chests. The finding of relatively large numbers of persons with tuberculosis in these institutions was a revelation. In the meantime, Dr. H. E. Hilleboe became deeply interested in this subject and conducted some excellent tuberculosis work in our state institutions.

On October 28, 1941, our Committee received the following communication from the Council: "The Committee on State Health Relations at a recent meeting recommended to the Council that the Committee on Tuberculosis look into the matter of isolation of tuberculosis cases in state institutions. It was moved, seconded and carried that this matter be referred to the Committee on Tuberculosis."

Because of the fine work which Drs. Burns and Hilleboe had already done in this field, the Committee invited Dr. Hilleboe to address its November meeting. He stated that in the seven hospitals under consideration, there is a patient population of 11,000 with 3,000 employees. He pointed out that the danger of tuberculosis in these institutions is great to the public at large because there are at any given time some 1,500 patients away from the institutions on visits and the employees usually do not live in the institutions. Therefore, there is a great deal of mingling of patients and employees with other persons throughout the state.

Dr. Hilleboe called attention to the fact that because of the contact of employees with tuberculosis patients in the institutions, a great deal of tuberculosis develops among the employees. Moreover, many patients who enter free from clinical tuberculosis develop the disease while in the institutions, which may be due in part to contact with patients who already have the disease in a contagious stage. Because the incidence of infection among the inmates was found to be approximately 85 per cent, the tuberculin test seemed unnecessary, as it might be assumed that practically all persons needed other phases of the examination. Since the 14 by 17 inch celluloid x-ray films are so expensive, it was decided to use the 35 millimeter film in this survey. However, in the Anoka institution both 14 by 17 inch celluloid and 35 millimeter films were used to test the efficiency of the 35 millimeter film. Eleven and one-half per cent of the minimal lesions detected by the large film was missed by the microfilm but the findings were essentially the same for the two films with reference to more extensive lesions. In this survey the employees also had x-ray film inspection of the chest.

Among the 14,500 inmates and employees, 1,100 were found to have the reinfection type of tuberculosis. Dr. Hilleboe's recommendations are as follows:

- (1) The tuberculin test should be administered to all new inmates if the infection incidence among them is not too high.
- (2) All found to have reinfection type of tuberculosis should be segregated.

- (3) Careful follow-up examinations should be made on all with quiescent tuberculosis.

In order to carry out these recommendations, Dr. Hilleboe made the following suggestions:

1. That one center be established for isolation and treatment.

All active and inactive cases should be in one institution and the one at Anoka has been proposed for that purpose. There are 1,440 beds there in ten separate buildings, housing from 100 to 400 patients each. Anoka is near to the cities and consultants are therefore easily available. Non-tuberculous patients from Anoka would be sent to other institutions and the tuberculous population could be classified and housed according to the activity of their disease in the various buildings. If this plan were followed it might be possible to get one or two full-time physicians in tuberculosis to work in the institution in addition to the psychiatric staff.

2. That some kind of x-ray equipment be provided to go through all inmates of other institutions for one year to pick up all remaining persons who may break down in that period. If the rate of breakdowns decreases then, it may be possible

to skip a year in the procedure. Only thus can the reservoir of infection in the institutions for mental patients be wiped out. If more counties are to be accredited for tuberculosis control this reservoir must be removed and it is far easier to catch and treat these infected persons in the institutions than in the general population of the state.

The Governor appears sympathetic to the program and it seems likely that something may be done if we are ready to present the problem on July 1, Dr. Hilleboe believes.

It should be remembered that the employees in these institutions live in the communities, not in the hospitals. Also, about 25 per cent of inmates, according to Doctor Freeman, are discharged permanently over a period of ten years. The problem of visitors to patients is likewise serious and should be considered.

Dr. Hilleboe estimated that a minimum of about \$50,000 would be needed to continue the program of controlling tuberculosis in the institutions for the mentally ill in Minnesota. On request of the Committee, Dr. Hilleboe agreed to provide a complete report of the survey for the use of the Committee.

Resolution Regarding Dr. Chesley.—Because of the fine interest the Minnesota State Department of Health has taken in tuberculosis since its organization in 1872, and especially because of the work that has been done in more recent years, under the direction of Dr. A. J. Chesley, the Committee adopted a resolution at its September meeting to the effect that this committee extends warm appreciation to Dr. Chesley for his services to tuberculosis control in Minnesota and particularly for his aid and cooperation in the work of this committee.

Extensive scientific and epidemiological material was arranged for exhibit at the State Association meeting at Duluth. All phases of committee activity were represented.

Accreditation of Counties.—At the September, 1941, meeting of the Committee, it was suggested that standards be determined by which counties in the state of Minnesota might qualify for special recognition or accreditation. The members of the Committee were unanimous in their opinion that the time was ready for such a procedure. Dr. A. J. Chesley and Dr. Orianna McDaniel of the Minnesota Department of Health promptly provided the Committee with the average mortality rate from tuberculosis over the past five years for each of the eighty-seven counties. Committee members agreed that one standard for accreditation should be an average mortality rate over the past five years of ten or less per 100,000. By this standard four counties already qualified: Lincoln, 5.5; Olmsted, 8.7; Murray, 9.4; and Stevens, 9.2.

The Committee decided that there should also be a second standard, which would consist of testing at least 80 per cent of all the seniors in the high schools of a county and finding not more than 15 per cent reactors. The physicians of Lincoln County were informed that the lowest mortality rate in the state obtained there and that if the county could qualify for the second standard, it would be the first to be accredited. Within two weeks of this announcement, the practicing physicians of Lincoln County had tested the seniors in the high schools and reported an incidence of only 7.4 per cent reactors. Therefore, accreditation appeared to be a reality in that county.

It was agreed that the work of the Tuberculosis Committee would consist of encouraging and aiding the physicians in the various counties in achieving the standards of Accreditation; that the Committee would accept the figures reported by the physicians of the counties and would transmit them with the Committee's recommendations to the Council. If approved by the Council, this body would submit them to the State Department of Health and if approved, the county would be accredited.

This proposal was presented to the Council and on October 28, 1941, the Committee received the following communication: "The matter of issuing a certificate or some means of recognition to the four counties in Minnesota eligible for accreditation was discussed. It was moved, seconded and carried that the State Department of Health and the State Medical Association, subject to the approval of the Department of Health, issue a certificate of accreditation and the Committee on Tuberculosis and the Department of Health prepare the certificate." It was then presented to the State Department of Health at its October meeting, where it met with unanimous approval.

Members of the Committee, together with Drs. Ruth E. Boynton and A. G. Schulze, proceeded to draw up a certificate form, which was later approved by the Council and the State Department of Health. This certificate was to be signed by the Governor of the state, the Executive Secretary of the State Department of Health and the President of the State Medical Association.

Accreditation of Lincoln County.—Since Lincoln County had qualified for accreditation, arrangements were made for a celebration at Tyler, Minnesota, on December 11, 1941. This was an historical event in the tuberculosis control movement in the state of Minnesota and the entire nation. Large numbers of persons from various walks of life attended the ceremonies and the certificate signed by Governor Harold E. Stassen, Dr. A. J. Chesley, Executive Secretary of the Minnesota Department of Health, and Dr. B. J. Branton, President of the State Medical Association, was presented.

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

Accreditation of Olmsted County.—In the meantime the physicians of Olmsted County proceeded to test the seniors in the high schools and the percentage found together with a mortality rate of 8.7 per cent for the past five years qualified this county for accreditation. On May 22, 1942, the accreditation ceremonies were held in the Central School Auditorium at Rochester, Minnesota. Dr. C. A. Stewart, Director of the Department of Pediatrics of Louisiana State University in New Orleans was the principal speaker. He presented in a splendid manner the history of tuberculosis control in Minnesota. Many prominent persons attended the ceremonies and the certificate was presented to Olmsted County by Dr. H. Z. Giffin, President of the Minnesota State Medical Association, whose signature it bore, as well as that of Governor Stassen and Dr. A. J. Chesley.

Plans for Accreditation of Murray and Stevens Counties.—Upon learning that Murray County might qualify for accreditation, the practicing physicians hastened to the high school where 96 per cent of the seniors were tested with tuberculin and only 5.5 per cent reacted. Those in charge of the work in this county have decided that they would like to have the accreditation ceremonies conducted at the time of their County Fair, when large numbers of citizens will be assembled.

Stevens County has also qualified from the standpoint of mortality rate and the senior high school students are being tested. On the basis of previous testing in this county there seems little doubt but that the incidence of reactors will be well within the qualification limits.

Thus, for the first time in America, the county has been employed as the unit in tuberculosis control, with the local practicing physicians and their allies conducting the work and with special recognition being given by official organizations.

The Meeker County Project.—The Meeker County project has continued and from time to time the physicians of this county have reported definite progress. The program outlined consisted of the administration of the tuberculin test to persons of all ages among the total population of approximately 20,000. All tuberculin reactors found on first or subsequent testing were to have x-ray film inspections of their chests (except children from birth to twelve years.) All persons found to have pulmonary lesions, as manifested by shadows on the x-ray films, were to be completely examined, to determine the etiology of their disease, and those who were proved to have clinical tuberculosis in the contagious stage were to be isolated at once, while those with such disease in the pre-contagious stage would be treated by either their local physicians or hospitalized, as recommended by their physicians. When this program was adopted, arrangements were made whereby the State Department of Health would provide tuberculin in the proper dilution without expense to the physicians of Meeker County; the tuberculin was to be delivered on the request of the individual physician.

The question of x-ray film was discussed at a number of meetings and producers of films were contacted with reference to any possible provision for supplying films at reduced cost for such a demonstration. None of the makers of celluloid films found his way clear to provide film at a cost less than the usual market price. The paper film, which has been found to be equal to the celluloid film in the detection of disease in the lungs, was then considered. This film has been used extensively by such persons as Dr. H. R. Edwards, Director of the Bureau of Tuberculosis, Department of Health of the City of New York, the Advisory Committee on Tuberculosis of the Medical Society of New Jersey, aided by Dr. Abraham E. Jaffin, and Dr. H. D. Lees of the University of Pennsylvania. It has also been used widely by several members of our own Committee, who have found it equal to the celluloid film.

One of the companies producing paper x-ray film, the Powers X-ray Products, Inc., was contacted and it was found that this film could be procured at an extremely low cost. The physicians of Meeker County were willing to give the paper film a trial, if the State Medical Association would procure it for them. At the April, 1942, meeting of the Tuberculosis Committee Dr. Karl Danielson of Litchfield stated that the paper film had been found entirely satisfactory by the doctors of Meeker County and there had been no difficulty whatsoever in developing a satisfactory technique of processing this film. Therefore, the expense of making x-ray film inspection of the chest has been extremely small.

Accomplishments.—On May 1, 1942, the Meeker County physicians reported that 5,412 persons had been tested with tuberculin; 21.8 per cent reacted. From this group 10 were found to have clinical pulmonary tuberculosis, for whom adequate treatment has been provided. There is no place in the United States, and probably none in the world, where a group of practicing physicians have manifested a finer spirit in controlling tuberculosis than that of the Meeker County group. They have conducted the examinations with no remuneration and have at all times been enthusiastic about the work.

Procurement of Funds.—The only serious difficulty has been the procurement of funds to provide for the necessary expenses. The State Medical Association has contributed approximately \$1,000.00 to this cause. The Northwestern National Life Insurance Company and the Minnesota Mutual Life Insurance Company manifested considerable interest in the project but found it impossible to offer more than moral support.

The Meeker County Commissioners have been contacted by the local physicians but they have not seen their way clear to offer any financial assistance. On April 20, 1942, the Ex-

ecutive Committee of the Minnesota Public Health Association took favorable action toward providing some financial assistance. This was accomplished through the efforts of Drs. Meyerding and Slater. On May 8, 1942, Dr. S. A. Slater presented the Meeker County program to the Board of Directors of the National Tuberculosis Association at its regular meeting in the Bellevue-Stratford Hotel in Philadelphia. He requested \$1,000.00 which was granted by this organization. While the sum available from the Christmas Seal organizations is extremely helpful, it is not adequate to carry the project to completion.

Although film has been provided for the physicians in Meeker County, we do not feel that they should be required to use their x-ray equipment and process the films at their own expense. To us it seems more than sufficient that they are giving at least \$100,000.00 worth of service to the citizens of their county. Therefore, more funds are necessary to provide only for expenses. As the project continues there will be definite need for one or two paid workers to go from house to house and even administer tuberculin tests in the homes, the fields, and elsewhere, and actually bring to the physicians' offices the reactors for x-ray film inspections of their chests. Although practically no opposition has been manifested to the tuberculin test or any other phase of the examination, there are always such factors as procrastination which make necessary actual contact by a paid worker. The members of our Committee are hopeful that some public-spirited Minnesota citizen, who has adequate funds, will come to the rescue. Such a person could easily be immortalized and his name would go down in history as one of the great benefactors of mankind for making possible an "all-out," county-wide tuberculosis program. We do not believe there is any doubt but that this is the only way to solve the tuberculosis problem and that the Meeker County demonstration will be adopted not only by the other counties of Minnesota but also the counties of the entire nation. No member of the Tuberculosis Committee or of the Meeker County group of physicians is to profit in any way or, indeed, receive any remuneration whatsoever from any funds contributed by organizations or individuals; all of us are giving our time willingly and enthusiastically, with the thought of defeating the greatest disease enemy of mankind since the beginning of history.

National Publicity.—Encouragement was provided for all persons participating in the Meeker County tuberculosis control project when on May 2, 1942, page 18, *Colliers'* magazine published an article by Robert Thompson entitled, "Worth More Than a Cow," in which the author describes the Meeker County program. This has brought the Meeker County project to the attention of the nation, as well as other countries. The physicians of the Minnesota State Medical Association cannot find words to express their great appreciation to Robert Thompson and to the editorial staff of *Colliers'* magazine, of which Mr. William L. Chenery is Editor, Charles Colebaugh is Managing Editor, and Thomas H. Beck is Editorial Director, for this wonderful service to humanity.

Interest of Governor Stassen.—The members of the Committee are delighted with the fine interest Governor Harold E. Stassen has manifested in tuberculosis. At one of the meetings, it was thought desirable to assemble our various proposals and ask the Governor to meet with us so that we might benefit from his suggestions and recommendations. On March 31, 1942 an invitation was extended to him and on April 2, 1942 he wrote: "I shall be glad to meet with the Committee as you suggested." The Committee, therefore, is preparing all of its present recommendations and desires to have this meeting with the Governor some time during the summer.

J. A. MYERS, M.D., *Chairman*

COMMITTEE ON PSYCHOPATHIC PERSONALITIES

The Committee on Psychopathic Personalities was not active during the past year but it was felt the Committee should be kept intact in order to deal with questions which might be raised by the State Bar Association's Committee on Psychopathic Personality.

Your chairman has been asked to write an article for the *Law Review* on the subjective and he intends to do so in cooperation with Mr. Kent Van den Berg of the Attorney General's Office.

GORDON R. KAMMAN, M.D., *Chairman*

COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Since the county medical society meetings are the most practical centers for the dissemination of medical knowledge, this committee is attempting to learn more about these groups throughout Minnesota. A circular on various aspects of these meetings has been returned and is now in the process of being reviewed.

ARTHUR H. WELLS, M.D., *Chairman*

HEART COMMITTEE

All members of the committee, except two (local) were circularized asking for ideas and comments on a program for the year. No replies were received. I am sure that owing to the war, all of the members are under more stress than usual, for which reason the committee's function, in spite of the staggering of membership, is still a negative quantity.

HENRY L. ULRICH, M.D., *Chairman*

COMMITTEE TO STUDY MOTOR VEHICLE
ACCIDENTS

After considerable study in the year 1940 and 1941, this Committee reported to the Council and House of Delegates last year that there was controversy in this subject, advised that we take a conservative attitude and sort of watch it from the sidelines. Time has indicated this to have been a wise procedure.

During the past year, there has been nothing, regarding this subject, brought to the attention of the Committee; there have been no meetings and we have no further report to make.

We feel that the purpose for which this Committee was formed has been fulfilled and we, therefore, respectfully suggest that it be disbanded.

J. C. HULTKRANS, M.D., *Chairman*

DR. LYNCH, Chairman of Reference Committee: Without comment we move acceptance of the Report of the Committee on Psychopathic Personalities.

Without comment we move acceptance of the Report of the Committee on Medical Education and Hospitals.

Without comment we move acceptance of the Report of the Heart Committee.

Without comment we move acceptance of the Report of the Committee to Study Motor Vehicle Accidents.

We move acceptance of the Report of the Committee on Cancer and wish to compliment them on their efforts and the cooperation obtained by them from the Minnesota Society for the Control of Cancer and the Women's Field Army for the Control of Cancer.

We move acceptance of the Report of the Committee on First Aid and Red Cross and congratulate them on the success of their efforts in aiding the program of first-aid teaching. Numerous members of the State Medical Association have been very generous with their time and very cooperative in following the standards of the Red Cross text book rather than confusing the public by teaching their own methods.

We move acceptance of the Report of the Committee on the Conservation of Hearing. We approve of their general program with emphasis on the necessity for further instruction of the medical profession. It is hoped that this committee can obtain even more effective cooperation with the State Department of Health and the State Department of Education.

We move acceptance of the Report of the Committee on Vaccination and Immunization. We congratulate them on the success of their efforts and hope that they will gain an even greater degree of success next year.

We move acceptance of the Report of the Committee on Tuberculosis and call the attention of the individual delegates to the complete report of the committee and urge that it be read by every delegate. We further call the attention of the Council to the request of the Committee on Tuberculosis for consideration of the issuance of annual certificates of approval to tuberculosis institutions meeting the minimum standard of requirements after inspection. We congratulate the committee on their institution of the program of accreditation of counties whose average mortality rate and estimated infection rate meet with certain standards set up by the committee. The members of the House of Delegates are probably completely familiar with the Meeker County Project which has attracted considerable local and national publicity for the problem of tuberculous infection. We hope that the outcome of this study will be very helpful in determining the nature of our efforts along this line in the future.

Five minutes being allotted to each committee chairman who desired to discuss the report of his committee, the Speaker called on the chairman of the committees as follows:

DR. HORACE NEWHART, Minneapolis, Chairman of Committee on Conservation of Hearing: Opportunities for real accomplishment in the neglected field of conservation of hearing have never been greater. The program in our own state is not what we would like to have it but the work of testing hearing of school children

is today underway in forty communities, 35,000 children having been tested in one city during the past year. Because progress has been rapid in the last few years an educational program is needed among our own members to familiarize them with new developments in prevention of unnecessary hearing handicaps. More attention should be given to the subject in county and state society meetings so that we may in turn help to educate the people in the possibility of protecting many future citizens from the misfortune of deafness. When this is done we may hope to introduce with success carefully planned legislation to permit establishment of a program such as has been established in other states, to take care of the school child and ultimately to reach out into other fields, especially in industry, so as to prevent hearing defects. The State Departments of Health and Education are the channels through which this must be accomplished. So far it has been impossible to put such a program into motion because of lack of funds. If medical men back such a movement, however, appropriations and proper legislation can be obtained. If not it is quite possible that the responsibility will be assumed by non-medical groups. We need to be more energetic in this field of preventive medicine.

DR. A. H. WELLS, Duluth, chairman of Committee on Hospitals and Medical Legislation: My object in speaking to you now is to ask you for suggestions for our work. To that end, we have sent out a list of questions to secretaries and we are compiling lists of activities of medical societies. What it is going to yield I do not know. We must not let down on our program of post-graduate education, but we should have definite information about what you want in mapping our program.

DR. J. A. MYERS, Minneapolis, chairman of Committee on Tuberculosis: The medical profession of Minnesota holds in its palm the solution of the tuberculosis problem. The accomplishments of the profession in Minnesota have always been outstanding. In 1911, 2,500 people died of tuberculosis in Minnesota, a mortality rate of 110. In 1941, approximately 700 died from tuberculosis with a rate of 27 per 100,000 population. Furthermore, we now have the facilities and the knowledge necessary to control this disease. We have the technique, the sanatorium beds, an unusually well-informed public and an active State Board of Health. All that remains is to go forward and put them to use. We have made a start, as you know, in Meeker county and in the accreditation program. I would like to say a word about the doctors of Meeker county in this connection. I do not think anyone in our tuberculosis work has ever shown a finer spirit than has been manifested by this group. Their enthusiasm has not waned. They will complete the program in Meeker county and the Committee is only hoping that other counties will take up similar demonstrations when this one is completed. The accreditation program is also progressing. Two counties, Lincoln and Olmsted, have already been accredited. Murray county is ready and, there, due to Dr. Slater's fine work, out of 97 per cent of the seniors who submitted to the test only 5.1 per cent reacted. We are looking forward to a time when every county in the state will be accredited. The committee is doing its best to bring the very latest knowledge about tuberculosis to all our groups of medical men and at the same time it asks for suggestions from all doctors who are willing to aid in this program. The time is not far away, we feel, when tuberculosis will be reduced to the same low level as typhoid and diphtheria in this state.

DR. A. E. Cardle, Minneapolis, asked Dr. Newhart from the floor what has been done in the way of ameliorating ear defects following tests of hearing.

DR. NEWHART: That is a very proper question. A great deal has been done in the way of medical follow-

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

up to remove causes and treat the individual patient thus discovered. The importance of testing among school children lies in the fact that this early discovery makes effective treatment possible. There is another type of follow-up, too, which lies in educational adjustments, training in lip-reading, et cetera. It is also going forward as extensively as facilities permit.

At the request of the Speaker it was then moved, seconded and carried that the report of the Reference Committee on Medical Education reports be accepted.

The Speaker then called for the report of the Reference Committee on Miscellaneous Scientific reports of which Dr. A. N. Collins of Duluth was chairman.

The following reports were considered:

COMMITTEE ON CHILD HEALTH

On February 28, 1942, a meeting of the Committee on Child Health was held. The greater part of the time was occupied by discussion of the Summer Round-Up Program of the Parent-Teachers' Association and the matter of examinations of school children. A recommendation was prepared and transmitted to the Council of the State Medical Association relative to arrangements for an institute to be held at the Center for Continuation Study to which members of the State Association will be invited. Further discussion dealt with the program of the Bureau for Crippled Children which has to do with the study and care of children with heart disease. The Council was asked to accept the resolution pledging the cooperation of the profession of the State in the program.

R. L. J. KENNEDY, M.D., *Chairman*

COMMITTEE ON MEDICAL TESTIMONY

The Medical Testimony Committee has reviewed two cases during the past year. One case was referred to the Committee by a physician; the other case by a Judge of the Supreme Court. After reviewing the entire proceedings, a member of the Committee was appointed to discuss the testimony of the physicians in question with them. This was done and will undoubtedly have a beneficial effect.

On several occasions members of the Committee have received verbal reports from physicians about certain questionable testimony given in court by medical men of our Society. However, the complaining physicians would not submit a proper complaint in writing. For that reason, your Committee was unable to proceed with the investigation of these cases, two of which your Chairman believes should have been investigated.

The committee has adopted the policy that, in the future, the name of the physician requesting an investigation about questionable testimony given in any court by any physician in the state of Minnesota be kept confidential and known only to the members of the committee. This will avoid any possible embarrassment to the physician requesting the investigation. Furthermore, it should overcome entirely the unwillingness of members of the Minnesota State Medical Association to report in writing these physicians whose testimony requires careful study by the Medical Testimony Committee. Your committee will do their utmost to keep the standards of medical expert testimony at its highest level in the courts of this state provided we have the full cooperation of every member of our association. The committee feels that the members of the State Medical Association have not given their full support in either hesitating or being negligent in advising this committee in writing.

Requests have been received from six state and county Medical Societies to advise them about the details of our Committee.

Two articles have been published in the Journal of American Insurance, and in the Bulletin of the Association of Railway Claim Agents (National Journals) describing the activities of the Medical Testimony Committee of our Society.

E. M. HAMMES, M.D., *Chairman*

COMMITTEE ON OPHTHALMOLOGY

On September 26, the Committee on Ophthalmology met with Mr. N. H. Debel and Mr. P. J. O'Connor of the Industrial Commission, to discuss the standardization of disabilities due to ocular injuries. The report of the Committee on Visual Economics of the American Medical Association was called to the attention of the members of the Industrial Commission. This report takes into consideration corrected visual acuity, field defects, ocular motility, visual deficiency of one eye and of the coordinate visual efficiency of both eyes, before evaluating disability. Furthermore it suggests that compensation shall not be computed until all reasonable operations and treatment have been attempted to correct the defect, and that at least three, and in some cases up to sixteen, months have elapsed after all visible evidences of inflammation have subsided, before evaluating the disability.

Messrs. Debel and O'Connor were very pleased to enter into the discussion of the problem and anxious to cooperate in any plan which would facilitate obtaining a fair settlement of compensation resulting from ocular injuries. Mr. Debel requested that copies of the report be sent to him for distribution among the Commissioners, Referees and Attorneys, to assist them in their work of evaluating ocular disabilities.

At the request of the Committee on Ophthalmology, the Report of the Visual Economics Committee was reprinted in MINNESOTA MEDICINE.

The Committee on Ophthalmology approved the plan of the Minnesota Society for the Prevention of Blindness, to conduct a diagnostic survey of the eye conditions of school children in one county in the State. This survey was to be conducted by members of the University Hospital Staff, not in private practice, and was to be diagnostic in nature only. The Committee recommended to the State Medical Association that they make a donation to help carry out this survey. The Council responded with a liberal donation.

T. R. FRITSCH, M.D., *Chairman*

COMMITTEE ON FRACTURES

The Committee on Fractures of the Minnesota State Medical Association for 1942 has continued to give attention to improvement of the emergency care and transportation of simple and compound fractures of the long bones of the extremities, as recommended in the report of the 1941 committee published in the November, 1941, issue of MINNESOTA MEDICINE on pages 985 and 986. In the 1941 report it was recommended that a city ordinance be passed, in all cities of Minnesota, requiring minimum splint equipment on ambulances and requiring that ambulance attendants have knowledge of first aid and of the application of transportation splints. In order to obtain the passage of such an ordinance there must be considerable preliminary work performed by members of the committee on fractures or by someone who is interested in improving the care of fractures in his community and who recognizes the value of proper first aid and transportation splints in fracture cases. All members of the medical profession must first be sold on the value and practicability of the splint program so that when they are consulted by the local city council members they will know the answers. The former complaint that there was "a danger of putting the practice of medicine in the hands of laymen," with the splint campaign, is no longer heard. The private ambulance companies can be easily sold by giving them demonstrations of the use and value of the splints for the comfort and safety of the patients they are transporting and by showing the ambulance companies that when their improved service becomes known their number of calls will be increased and there will then be less jack-knifing of fracture patients into automobiles for transportation without proper splinting. It is not difficult to persuade the authorities of charity institutions that the costs to the taxpayers will be lowered when charity patients arrive with fractures that have been properly splinted and where further damage to the soft parts in transportation has been prevented. Money will be saved because of a shortened period of hospitalization and of morbidity after leaving the hospital and the patient will spend less time on relief. There will also be less permanent disability resulting from the fracture and consequently the patient will earn more money sooner if he has had proper first aid and transportation splints for his fracture. Before going before the city council it is well not only to line up the members of the profession, the private ambulance companies and the charity hospitals but it is also well to obtain the official approval of the county medical society and the local surgical society so that one can inform the council members that there is not only no local opposition but also that official action has been taken by representative bodies of the medical profession. After having laid this groundwork the value of the ordinance lies in the fact that it has become a recognized necessity in the community and the penalty clause insures continuity of the program.

The ordinance passed in Minneapolis in the spring of 1942 is presented in this report so that others may be saved some of the time and effort required in preparing such a law. This ordinance is more detailed and specific than the one published in the 1941 report of the Committee on Fractures.

AN ORDINANCE

REGULATING PUBLIC AND PRIVATE AMBULANCES, OPERATED IN THE CITY OF MINNEAPOLIS; PROVIDING FOR MINIMUM EQUIPMENT OF SUCH AMBULANCES AND FIRST AID SERVICE THEREIN; PROHIBITING OPERATION WITHOUT A PERMIT FROM THE COMMISSIONER OF HEALTH, AND PROVIDING PENALTIES FOR VIOLATION THEREOF.

The City Council of the City of Minneapolis do ordain as follows:

Section 1. No person, firm or corporation shall operate or cause to be operated in the City of Minneapolis any ambulance, public or private, or any other vehicle commonly used for the transportation or conveyance of the sick or injured, without first securing a permit therefor from the Commissioner of Health as hereinafter provided.

Section 2. Every ambulance or vehicle hereinafter described, before permit is issued therefor, shall be equipped with and, when in service, carry as minimum equipment the following:

(a) Two United States Army hinged ring upper extremity splints, or in lieu thereof, two splints for the upper extremity, approved by the State Department of Health.

(b) Two United States Army hinged half-ring lower extremity splints, or in lieu thereof, two lower extremity splints, approved by the State Department of Health.

Section 3. Every such ambulance or vehicle hereinafter described when in service shall be accompanied by at least one person who has acquired theoretical or practical knowledge in first aid as ambulance attendant and in the application and use of approved splints to arm and leg fractures, evidenced by

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

a certificate issued to such person by the State Department of Health or by the Commissioner of Health of the City of Minneapolis, under such rules and regulations as either may prescribe.

Section 4. Application for a permit to operate any such ambulance or other vehicle hereinabove described on the streets of Minneapolis shall be made to the Commissioner of Health upon such form as he shall prescribe, which application shall contain evidence satisfactory to the Commissioner of Health that the person seeking the permit has complied with the minimum standards set forth in this ordinance as to first aid equipment and is prepared to and will furnish an ambulance attendant, as required in Section 3 hereof. If the Commissioner of Health finds that the requirements of this ordinance are and will be met by the applicant as to each vehicle proposed to be operated, he shall issue a permit, upon payment of a fee of One Dollar (\$1.00) for each vehicle, which permit shall expire upon the first Monday in May next following the issuance thereof. Such permit may be renewed by the Commissioner of Health from year to year, upon such evidence as shall be required by the Commissioner of Health that the holder thereof is complying with the minimum requirements of this ordinance and upon payment of an annual fee of One Dollar (\$1.00). No fee shall be required for a permit for an ambulance or vehicle owned and operated by the City of Minneapolis or any of its boards or departments.

Each permit shall be numbered and posted at such place in the interior of the ambulance or vehicle as the Commissioner of Health may require.

Any such permit shall be subject to revocation by the Commissioner of Health for failure to comply with any of the provisions hereof, upon notice and an opportunity to be heard.

Section 5. Any person violating the provisions of this ordinance shall, upon conviction thereof, be punished by a fine of not to exceed One Hundred Dollars (\$100.00), or by imprisonment for not more than ninety (90) days.

Section 6. This ordinance shall take effect and be in force from and after the first Monday in May, 1942; provided, that applications for a permit hereunder may be made prior to said day, after the passage and publication hereof, for a permit beginning upon said first Monday in May.

Passed April 24, 1942. W. Glen Wallace, President of the Council.

Approved April 24, 1942. Marvin L. Kline, Mayor

Attest: Chas. C. Swanson, City Clerk.

In the above Ordinance the United States Army splints have been mentioned on the theory that when better splints are made the Army will use them. Furthermore many members of the medical profession and of the laity who are in the Army will be familiar with these splints on their return home and will expect to find them available.

There has been some objection to the hinged ring upper extremity splint because of the danger of over-pulling and of pressure paralysis due to the traction applied. There are very few instruments in surgery which cannot be wrongly used. Every movie film and nearly every paper on the subject has called attention to this danger which also exists, in part, with every case where crutches are worn. It might be mentioned that our attention has been called to cases where the lower extremity splints has been wrongly applied. There is still some objection to the use of traction type splints in cases where one end of the bone in a compound fracture has penetrated the skin and is still protruding. This point was thoroughly discussed in the 1941 report. The uses and values of these splints in compound fractures is now again being demonstrated in the present war where they are being applied by private soldiers. It should also be noted that in the ordinance improved splints or substitute splints have been allowed for subject to their being approved by the Department of Health.

ROSCOE C. WEBB, M.D., *Chairman*

HISTORICAL COMMITTEE

Your Historical Committee submits the following report: Beginning with January, 1938, and continuing to date, there have been published in MINNESOTA MEDICINE the following articles on the pioneer history of medicine in Minnesota:

Introduction

The background of medical history for northeastern Minnesota and the Lake Superior Region

Organization of the St. Louis County Medical Society

Survey of pioneer members of the St. Louis County Medical Society

Pioneer physicians of the Vermillion and Mesaba Ranges in Minnesota

Medicine in Washington and Chisago Counties

History of medicine in Ramsey County

History of medicine in Hennepin County

History of medicine in Winona County

The missionary as a practitioner

Diseases of the Dakota Indians

Dakota medicine

History of medicine in Dakota County

History of medicine in Brown County

Homeopathic and eclectic medicine in Minnesota

History of the Minnesota State Medical Society (in publication)

Material listed in May, 1941, by Dr. J. M. Armstrong as available for publication

Major papers: Edward Purcell, the first physician in Minnesota

Biography of Dr. William Sitgreaves Cox

Nicollet County

Asiatic cholera in St. Paul

Minnesota Valley Medical Society

Mower and Freeborn Counties

Kittson County

Wabasha County

Goodhue County

Medical books of W. W. Mayo

Steele and LeSueur Counties

Scott and Carver Counties

Beginning of the Mayo Clinic

Medical Instruction

Medical Journalism

Early practice of medicine in Minnesota

Medical men and fur traders

The advent of the frontier practitioner

Fairchild: First period of practice of medicine

Walling: Pioneer practice in the Northwest

Hospitalization and public health

As the result of this inquiry the following information has been received:

The narratives for Stearns and Benton Counties are under way. The histories for Martin and Faribault Counties (Blue Earth Valley Medical Society) and for Watonwan County are in preparation. A history for Swift County has been promised.

The history for Dodge County has been completed. Biographical data have been collected for Fillmore and Houston Counties and the accounts are being compiled. Investigative work in Olmsted County is being carried out.

Investigators have been appointed in Cottonwood, Jackson, Murray, Nobles, Pipestone, and Rock Counties (Southwestern Minnesota Medical Society), and in Big Stone, Pope, Stevens and Traverse Counties (West Central Minnesota Medical Society).

It is hoped that the members of the Historical Committee will act as representatives of the Committee in the different regions of the state to stimulate the work and bring it to completion.

Joint meeting: At a joint meeting of the Historical Committee and the Council on Friday, November 7, 1941, in Saint Paul, suggestions pertaining to publication of the book were discussed. It was thought at that time that the book might include histories of the State Board of Health, the State Medical Association, the State Board of Medical Examiners, state hospitals, medical schools, special medical societies and medical journals published in Minnesota.

Your Committee wishes to make three recommendations:

1. That the collection of historical data continue and that a working questionnaire for use by the historical investigators be printed by the State Medical Association.

2. That publication of the book be deferred for the duration of the present war emergency unless there is presented some method more practical than that now under consideration.

3. That steps be taken to secure an editor who will correlate the material so as to produce at a future date a concise, coherent history of two or more volumes.

M. C. PIPER, M.D., *Chairman*

COMMITTEE ON INDUSTRIAL HEALTH

Minnesota is in the upper third of the states so far as the number of workers in industry is concerned and industrial medicine is therefore more important here than many physicians have hitherto believed.

At its meeting in March of this year, the Committee on Industrial Health formally endorsed the entire program of the new Division of Industrial Health of the State Department of Health. Also they took action to publicize it and encourage the profession to cooperate in the survey on occupational disease begun by the division in February.

The program now underway under the leadership of the division is as follows:

1. To receive and investigate reports of all occupational diseases.

The committee took occasion to point out that some physicians might hesitate to send their reports under the impression that in so doing they might be betraying the companies by whom they are employed. It was generally agreed that, whether diseases are compensable under the law or not, it is essential to take whatever action is possible to control occupational diseases, lessen absenteeism and risks to the plant.

2. To promote employment of full-time or part-time physicians and nurses.

3. To provide properly equipped first-aid rooms and maintain sickness records.

4. To encourage use of preemployment and periodic physical examination, including routine Wassermann tests,—though the tests should not be used as a means of discrimination against employees who secure adequate treatment and do not present a hazard to fellow employees.

Dr. Foker reported to the committee that efforts of his Division are now concentrated on defense industries at the request of the United States Public Health Service; that trained engineering personnel are available to make plant

studies and to recommend methods of control for health hazards thus discovered; that plant executives have cooperated cordially with the division in the work.

At the present time the work of the division is financed largely by federal funds since the \$10,000 appropriation asked of the State Legislature did not materialize, though the State Emergency Finance Committee appropriated \$1,750 up to July 1 this year to aid in the work.

It was decided to provide whatever expert assistance might be required to the Interim Committee on Industrial Health of the State Legislature which has been investigating the advisability of changing the present law on compensable diseases generally regarded as incomplete and unsatisfactory. Also to acquaint other organizations, such as the Safety Council, nurses committees, dental groups, of the existence of the committee and suggest that a representative attend their meetings so as to keep the committee informed of their work in this field. Likewise to contact University authorities on the advisability of a more definite course of instruction in the medical school on industrial health and medicine.

In accordance with action taken by the House of Delegates last year a page has been set aside in MINNESOTA MEDICINE each month for discussions on Industrial Health. Short articles are now appearing monthly by members of the committee on practical aspects of plant health and control of disease among workers. A complete analysis of the program of the Division of Industrial Health and especially of the survey on occupational diseases has also appeared in these pages.

It is the hope of the committee that this monthly editorial feature may be practical and valuable especially to general practitioners who will be called upon more and more to consult on health problems with local industries and to treat industrial patients.

The aid of all who are interested in this urgently important subject will be welcomed for this section.

J. L. McLEOD, M.D., *Chairman*

COMMITTEE ON INTERPROFESSIONAL RELATIONS

The first meeting was held on Friday evening, February 27, preceding the County Officers' Meeting. Representatives of the State Board of Nursing Examiners attended.

The purpose of the meeting was to discuss the nursing situation in Minnesota and to consider the resolution pertaining to this matter introduced at the last meeting of the House of Delegates, and referred to the Committee on Interprofessional Relations. More specifically this refers to certain points at issue between the State Board of Nurses' Examiners and St. John's Hospital at Red Wing, the Naevie, of Albert Lea, St. Lucas of Faribault, and St. Francis of Breckenridge.

Miss Halvorson, of the State Board of Nurses' Examiners had prepared charts, very completely showing all details of hospital administration as pertaining to nurses instruction, number of beds, patients in various departments, the present minimum standards of nursing education acceptable to the State Board of Nurses' Examiners, and the minimum standards to be enforced in September, 1942. Careful analysis shows but a slight discrepancy between these requirements and the present existing course of education for nurses in these hospitals.

It was brought out in the meeting that nurses to be officially recognized by the Red Cross must be graduates of institutions approved by the State Board of Nurses' Examiners and this also applies to nurses eligible to service with our armed forces. This illustrates one of the important points to be ironed out with reference to these hospitals, for if their graduates are not approved by the Board they cannot serve in the Army or Navy.

Many of the smaller hospitals in the state whose graduates are not recognized by the State Board of Nurses' Examiners are training their own nurses, and apparently, successfully. It was fully brought out by Dr. Carl Johnson that there is danger of these young women assuming too much responsibility as nurses, and after the present emergency, of their organization with accompanying demands for legal recognition. The question of affiliation with larger hospitals presents many complications, and this problem will require further consideration.

Two constructive suggestions resulted from this meeting; the first suggestion by Mr. Schacht of Red Wing was that there should be organized a liaison committee consisting of three doctors, three members of the State Nurses' Association, and three members of the State Hospital Association, to consider any questions which might properly come before them with reference to difficulties between the hospitals and the State Board of Nurses' Examiners. This idea was acted upon by the Council the following day, and Doctors Carl Johnson, P. F. Meyer, and F. J. Savage were appointed to represent the physicians. The Minnesota Nurses' Association has named Miss Ida M. MacDonald, 815 Essex Street, S. E., Minneapolis; Sister Mary Elizabeth, St. Francis Hospital, Breckenridge; Miss Mabel Korsell, present address, Powell Hall, Minneapolis. The Minnesota Hospital Association has named Mr. John Mitchell, business manager, Colonial Hospital, Rochester, Minnesota; Dina Bremness, superintendent, Community Hospital, Glenwood, Minnesota; and Sister Assumpta, superintendent, Hibbing Hospital, Hibbing, Minnesota.

The second important suggestion originated with Dr. Meyer of Faribault. To quote from his letter:

"We should evolve a forward-looking plan which would be constructive for the future, and not tear down the fine work so far accomplished in the education of our present-day nurses. The plan should take into consideration the present registered nurse, the future nurse, especially in regard to national Red Cross standards, and it should also safeguard the girls going into training in the smaller communities so that if they felt

like going farther in their studies, that the work that they have previously done would be recognized.

"The plan that I would like to propose should involve the organization and supervision by the State Board of Nurses of the smaller community hospitals. The setting up of definite standards would be universally recognized so that these trainees, if they chose, could continue at larger training centers for further training to become registered nurses. If they chose only to take a two-year training period, they could be called certified nurses. Mrs. Hein's suggestion of a central school for basic training of three months or six months, would fit well into such a plan. It would also insure a universal, sound, basic training upon which to build their future education.

"Some such plan, as this, would eliminate Dr. Johnson's protest about a poorer grade of vocational nurse. It would bring into line and under supervision all these smaller hospitals, and it would protect girls going into training in the smaller hospitals. It would not decrease the present standards that have been set up for registered nurses, and it would eliminate the present vicious practice of turning out vocational nurses which, if not curbed, will definitely undermine the present standards of nursing care in Minnesota."

The second meeting of this committee was held at St. Cloud, April 23.

Physicians, dentists, and pharmacists from the following counties were invited to this meeting: Stearns-Benton, Morrison, Todd, Douglas, Pope, Kandiyohi, Swift, Meeker, Wright and Sherburne; also the president and secretary of the State Board of Nurses' Examiners were present—a total of about eighty-five.

Dr. DuBois opened the meeting, and we quote some of his remarks.

"Doctors, dentists, nurses, and druggists are allied in their work and are interdependent and all of us must realize it. We are facing times we have never faced before, and we must have an allied front. In Washington there is a complete setup for socialized medicine. There will be many doctors who at the end of the war will have no particular place to go, and who can be shoved into government positions. We must be militant and let the public know that the ones who will suffer will be the public. Legislation should be watched with the public in mind, and as it affects the public it affects the professions. Anything can happen at the opportune time, and that may be at the end of the present conflict."

Talks were given by Mr. Slocumb, executive secretary of the State Pharmaceutical Association, Dr. DeVries, of the State Dental Association, Miss Newcombe and Miss Halvorson, respectively president and secretary-treasurer, of the State Board of Nurses' Examiners, Dr. A. F. Branton of Willmar, representing the Minnesota State Hospital Association, and Dr. Proshek, of Minneapolis, as well as others who took part in the general discussion.

Miss Newcombe gave a comprehensive exposition of why we are short of nurses at the present time. Student enrollment of nurses has increased 22 per cent from January, 1937, to January, 1942. Graduate registration in the same period has increased 47.3 per cent, but public health nursing from January, 1937, to January, 1941, has increased by 4,000 nurses. Industrial nursing in the same period has increased by 1,000. Airlines and passenger trains have also taken a considerable number. Hospital regulations, providing for eight-hour duty only, have still further decreased the number of available nurses; marriages are in the same class, and lastly the war, with Red Cross and government services. Per one thousand men in the Army, the need is for six nurses, and in the Navy, three nurses. For the same number, seven doctors for the Army, and six for the Navy, and one and one-half dentists. The Army nurses' corps needs ten thousand more nurses before July first.

To off-set some of this shortage there is an increased enrollment of student nurses. Refresher courses are given to nurses who have retired for various reasons. There is a possibility that some former training schools may be reopened. Ward Aids, Red Cross Volunteer Aids, auxiliary hospital workers, and the girls who do active nursing in the smaller hospitals, which are not recognized training schools, are all contributing to off-set the shortage of registered nurses. In Minneapolis a nine months' course for practical nurses is offered by the Vocational and Franklin Hospitals. About one hundred are graduated yearly. Since July, 1941, the Federal Government has allocated \$1,800,000 for nursing education.

It is apparent that the problems coming before this committee are not settled, and will require study over a considerable period of time.

F. J. SAVAGE, M.D., *Chairman*

COMMITTEE ON MATERNAL WELFARE

The Committee on Maternal Welfare has prepared a pamphlet on "Nutrition in Pregnancy" to be distributed by the Minnesota State Medical Association and State Board of Health. The major portion of the energy and time of this Committee has been expended through the subcommittee which is studying the maternal mortalities throughout the state.

In 1940 the maternal mortality rate in Minnesota was 2.2 deaths per 1,000 live births. This figure is only one-half that for the total United States Birth Registration Area and represents the goal of Physicians and Public Health Officers of probably two decades ago. The Maternal Welfare Committee of the Minnesota State Medical Association became interested in the possibilities of further reducing this enviably low maternal death rate and in determining the absolute irreducible rate for the State. The Committee obtained the cooperation of

the Minnesota State Medical Association and the State Board of Health, these two organizations becoming the co-sponsors of a statewide maternal mortality study.

The very nature of the Committee's queries necessitated the formation of a fact-finding organization. To this end the Committee appointed a subcommittee made up of nine representative physicians doing majorly obstetrics and located in various districts of the State. This subcommittee became known as the Maternal Mortality Committee, the duties of which were to formulate plans for the collection of data, to study each death associated with pregnancy, and to evaluate the results of such individual studies.

The State Board of Health has supplied three investigators whose duty it is to collect the desired information. They are relatively young men doing obstetrics and gynecology as a specialty and have within the past few years completed training required for American Board certification. They are part-time employees of the State Board of Health. Their salaries are obtained from funds supplied by the Children's Bureau of the U. S. Department of Labor made available expressly for this study.

Shortly before this study was begun, each practicing physician in the State obtained a letter of notification from the Health Department which stated the purpose of the study, its sponsorship, and plan of survey as well as a request from each to cooperate in making this a complete study as early after the death as possible. The assistance given the investigator conducting each individual study has been most gratifying. However, reports of all deaths of mothers, connected with childbearing, are not being immediately forwarded by letter to the State Board of Health as requested and many deaths are not discovered until reported via the Bureau of Vital Statistics. This means that not infrequently the investigator gets to the scene of action a month or more after the death has occurred. In the interim, events surrounding the death have been forgotten or become unclear and the individual study thereby loses much of its value. The plan is to collect the data from the physician within a few days of the maternal death and prompt reporting of all deaths, though the connection with pregnancy may not seem clear, is urgently requested.

Cases are assigned in rotation to the three investigators who then visit the physician by appointment in order to fill out the form adopted by the Committee for recording of all apparently pertinent data. Besides this, the investigator summarizes the case in chronological order, paying attention to every detail. The case study is then turned over to one of the Committee members who writes a brief summary which includes only such information bearing upon the cause of death. At the next regular meeting of the Maternal Mortality Committee, these cases are presented, all identifying features being withheld. The anonymous case is then discussed from all points of view as regards the merits and demerits of its handling. It is graded on the basis of minimum standards adopted by the Committee for this purpose.

So far, the Committee has acted simply as a fact-finding organization. Each case study is complete in itself and these form excellent material for a basis of group discussions of many of the complications of pregnancy, labor and the puerperium. It is hoped that local medical groups such as hospital staffs, county societies, etc., will utilize these for educational purposes. The Committee would propose that the interested medical group write the State Board of Health, Director of Maternal and Child Hygiene. Some member of the Committee could then meet with the group to present the records as anonymous case studies and act as Chairman of the discussion group if desired.

Though the study has been in progress for less than a year, preliminary surveys indicate that an appreciable further reduction in the rate will be revealed by the end of the first year. In all probability the maternal mortality rate will approach 1.5 per 1,000 live births, i.e., a reduction of almost 50% in the former rate. The absolute irreducible rate may be found to be about one per 1,000 live births.

RUSSELL J. MOE, M.D., *Chairman*

DR. A. N. COLLINS, Duluth, Chairman of Reference Committee on Miscellaneous Scientific reports: It was recommended that the Child Health Committee be continued.

We feel that the work of the Diabetes Committee is a very important function of the State Medical Association. We hope this committee will continue active interest in the dissemination to the profession of such information which they may obtain from time to time in advancing the treatment of diabetes. We recommend a continuation of this committee.

The report of the Medical Testimony Committee was reviewed and found very interesting. The problem of local disagreement in legal testimony still possesses embarrassing features. The committee would suggest consultation from outside the local community in so far as this is possible. The point brought out in the report regarding confidential information in medical testimony is commended.

The report of the Ophthalmology Committee was re-

viewed and the activities of the committee are commended, also its excellent report.

The report of the Fracture Committee was reviewed, and the committee is to be commended for its interest and activity and should be continued.

The report of the Historical Committee was reviewed, and it is very evident that the excellent work being done by this committee is continuing and that it will redound to the credit of the Minnesota State Association. The committee appreciates the devotion to detail in the assembling of information relative to the history of the Minnesota Medical Association and recommends the continuation of this committee and its personnel.

The report of the Industrial Health Committee is very complete and outlines their activities for the year. It is very well presented and has the commendation of the reference committee.

The report of the Interprofessional Relations Committee was received and read with much interest. The comment made in the report that the problems indicated therein are not completely settled and will require further study suggests that this committee should be continued. The reference committee suggests that perhaps a Gallop pole of the medical profession of the state as a whole might be valuable concerning the nursing situation in the state, gathering information as to training courses and length of terms, etc.

The report of the Maternal Welfare Committee was carefully read, and it is felt that the committee is to be commended for the orderly manner in which the information has been assembled and reported. It is recommended that the committee be continued.

Five minutes being allotted to the chairmen of each of the committees, Drs. Kennedy and Piper read their reports to the delegates. The report of the Reference Committee on Miscellaneous Scientific reports was accepted.

The Speaker then called for the report of the Reference Committee on Officers' and Councilors' Reports, Dr. S. A. Slater of Worthington, chairman. The following reports were considered:

REPORT OF THE SECRETARY

In spite of heavy added responsibilities and dislocations occasioned by the war, the Minnesota State Medical Association has carried on a full program of education, organization and public relations during the past year.

Chief among the special wartime tasks which the state office of the association has been asked to assume is the paper, organizational and secretarial work of the Procurement and Assignment Service in Minnesota.

This work has entailed many conferences and committee meetings and very close to the full-time attention of the executive secretary. In spite of it, more than the usual amount of field work has been carried on by the executive secretary whose trips have taken him to all parts of the state attending meetings and conferences, making investigations and generally looking after association interests.

It is obvious that the armed forces must make use of medical organization with its facilities for supplying information and for reaching officers and leaders of local medical societies. It is not at the present time in prospect that the War Department will find funds to finance such services. Physicians are therefore contributing not only their own services, in full measure, to the war effort but financing an important part of the machinery set up by the United States Army to complete its medical personnel.

With severe budget limitations ahead, the state office will continue to carry its share of added work and responsibility and, as in the year past, it will continue also to carry on the forward-looking program of education and social leadership mapped by its committees.

It becomes clear as the war advances that medical organizations will be called upon more and more, also, for enlightened leadership in the health instruction of civilians, in the distribution of scanty medical services and in the provision of care for the needy.

No Truce for Physicians.—There will be no truce for physicians who remain at their civilian posts during this war. They must take care of the civilian population at whatever cost to their previous plans for retirement. They must also unite to protect the status of medical practice and they must be more than ever watchful that no loopholes of reproach are left which will lead to government organization of their services at home.

The general public is keenly aware of the importance of civilian health to the war effort. It will be impatient of ob-

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

stacles and it will expect action. So long as physicians are clearly taking the lead through their own organizations in public education about such things as nutrition, preventive medicine, protection of the health of industrial workers and in provision of services to all, regardless of the absence of many of their number in the armed forces, efforts to take control out of their hands are likely to be unavailing.

Leadership in Minnesota.—The Minnesota State Medical Association has firmly established its leadership in Minnesota in the fields of health education and preventive medicine and in the redistribution of physicians to maintain essential services.

This leadership must go on if the position of organized medicine in Minnesota is to be maintained in spite of an active minority which here, as elsewhere, remains alert to seize upon apparent lapses and failure as pretexts for reform.

Office Mailing.—During the past year the program of the association has developed in many directions. The amount of printed matter including posters, pamphlets, packets, leaflets and other publications, all of which originated in the office, was much more than quadrupled. The number of mailing pieces, on a conservative estimate exceeded 82,000 in addition to 830,000 enclosures on nutrition, vaccination and immunization. They were sent out as part of several special association programs.

Vaccination and Immunization.—Anticipating the May day immunization and vaccination program of the Children's Bureau by six months, the state association, in cooperation with the State Board of Health, launched a state-wide campaign to promote vaccination and immunization last November. Radio talks and interviews and newspaper publicity initiated the effort. Two posters, one urging vaccination and the other immunization, were distributed widely over the state, together with leaflets for distribution at meetings and with statements. The result of these activities in nearly all counties of the state was a great increase in the demands for vaccine and toxoid supplied for community programs by the State Board of Health.

Nutrition Program.—The current wide-spread interest in nutrition in which a variety of lay agencies have taken a directing hand clearly called for authoritative guidance and leadership. For that reason and because better nutrition for the civilian population is important to the war effort, an official medical project for better nutrition in this state was inaugurated by the association this spring, with the cooperation and joint financial support of the State Board of Health. Four simple practical pamphlets were published for free distribution in doctors' offices, the first for expectant mothers, the second for the child from two to six, the third for the average family of adults and children and the fourth for those who are overweight. At the same time, posters were prepared bearing the slogan "For a Stronger America Eat More of the Right Foods" and telling how to secure the pamphlets. These posters were sent out widely to grocery stores, food markets of all kinds all over the state and to other public gathering places where they were likely to reach housewives and food buyers. Members who have received the pamphlets are urged to give them wide circulation and to supplement them with nutrition information of authoritative character to patients, and in all public contacts.

Tuberculosis Control.—An important part of the association's expanded program of preventive medicine has been its tuberculosis control project which was sponsored by the Committee on Tuberculosis and which has brought nationwide attention to Minnesota. This project includes an accreditation plan for tuberculosis control by counties and an experiment in county-wide testing of the entire population of Meeker county with a view to extending similar measures to other counties in the state. The plan follows the outlines of the program of the veterinarians for eradication of tuberculosis among cattle and is completely described in the report of the committee. It is in line with the plan of leadership in all public health activities which the medical association has undertaken in Minnesota and it has stirred an unusual amount of country-wide interest as evidenced in the article by Robert Thompson entitled "Worth More than a Cow" which appeared in *Colliers'* and which described the Meeker county project.

Pictorial History.—The pictorial history, "100 Years of Medicine in Minnesota," which marked the centenary of the coming of Christopher Carli, first civilian practitioner to the Northwest territory in 1841, was published by the association last fall. This publication, unique among such efforts, took advantage of the centenary to publish pictures of historical interest and to bring the story up-to-date with as complete a picture outline as possible of the extent and quality of medical services today in Minnesota. The book was sent to all physicians in the state and to libraries, organizations, schools and public officials. It received notice in all national health journals and met with universal approval. Requests for it continue to come in from all parts of the United States but the first printing has been virtually exhausted. A second printing will depend upon the demand and future budgets of the association.

In addition to the above special projects the regular services of the association were carried on as usual.

Packet Program.—The "subject-of-the-month" program by which monthly packets to physicians are coordinated with public health education on the same subjects began as usual in October and ended for the season in May. Requests for the packets climbed to a monthly average of 700 with the number reaching to nearly 1,000 for especially popular packets. Lists

of subjects are included in the report of the Committee on Public Health Education. The thanks of the association are due to the members who provided material for these packets and to the staff of the State Board of Health which provided statistical studies wherever possible. They constitute an ever more popular part of our service to members and the public.

Radio Program.—The weekly broadcasts over WCCO by Dr. W. A. O'Brien continued throughout the year, subject being selected to coincide and supplement packet subjects from October to May. This program is now in its 15th year and the oldest and most popular of all the sustaining programs on WCCO. In addition a large number of interviews and discussion broadcasts have been arranged in connection with special campaigns.

News Service.—The regular news service of the association was converted in January, 1942, from the former weekly news story release to a Question and Answer service to which nearly 200 papers are now subscribing. Each paper was provided with the mat for a standing two-column head bearing the headline "How's Your Health" on each, together with the address of the Committee on Public Health Education and an invitation to send questions to the committee headquarters at the state office for answers in print or by personal response on receipt of a stamped addressed envelope. So far the number of questions received has been highly satisfactory.

County Officers' Meeting.—Every component society in the state was represented at the County Officers' Meeting and dinner held at the Lowry Hotel, Saturday, February 28. The program was given over largely to special war requirements then shaping for medicine and attendance reached the unusual figure of 125. Dr. R. W. Fouts of Omaha, chairman of Procurement and Assignment for the Seventh Corps Area was dinner speaker.

Recruiting.—At the request of officials of the Seventh Corps Area, facilities of the State Office have been placed at the disposal of the Medical Recruiting Board which began operations for Minnesota physicians and dentists, Monday, May 25, at 496 Lowry Medical Arts Building.

The Board is part of two groups of recruiting boards operating respectively in the states east and west of the Mississippi. Officers are empowered to pass upon applications for commission and on physical findings and to administer the oath of office to qualified applicants for commission, in a minimum length of time. The objective is the procurement from the entire country of 16,000 medical officers for the U. S. Army, before December 31, 1942.

Names of applicants are checked with information on file with the office of the association.

Every possible assistance has been given to the recruiting office as part of the wartime service of the association. It is generally understood and agreed by all representatives of organized medicine that the present plan for allocating medical services to the armed forces and at the same time protecting the needs of the civilian population is better calculated to protect both the physicians and the public than indiscriminate recruiting through the Selective Service Boards.

The responsibility for supplying the armed services has been assumed by medical organizations for the first time and much will depend upon the success with which the plans of their organization, the Procurement and Assignment Service, are carried through.

It should be pointed out that there is no lack of disposition in several quarters in Washington to take the whole matter of supplying the extraordinary needs of the time away from the physicians. If that is done, the outlook for the private practice of medicine after the war in the United States will be dark indeed.

Right or wrong, the burden of proof now rests upon hard-pressed physicians. They must carry the load of providing personnel for the armed services and at the same time they must carry forward a vigorous, forward-looking program of preventive medicine and public health which will leave little excuse for government absorption of all medical services at home.

The State Office is equipped to provide the machinery and organization for this work. It depends upon officers and committees of the association to furnish the essential leadership. This they have done in full measure during the past year and the appreciation of all members as well as of the secretary's office should be extended to these men who have responded so willingly to all calls made upon them.

To the full-time staff, also, and to all who have aided in the far-flung program of the organization—but especially to the State Board of Health and its secretary and executive officer, Dr. A. J. Chesley who, with his staff has cooperated fully in every measure designed for the education and better health of the people of Minnesota—the appreciation of the secretary and of the organization should be extended.

It is a fact that without the close working relationship which exists in Minnesota between the State Board of Health and the practicing physicians, Minnesota's fine health record and our smooth, well-oiled machinery for the control and wise direction of all matters concerned with medicine and health in the state would be impossible.

The Committee on Public Policy, its faithful chairman, Dr. Sogge, and our attorney, Mr. Brist, form an integral and essential part of that machinery and their work, and Minnesota's model basic science legislation which they and their predecessors on the committee shaped and carried forward, are still the pattern toward which many other states are striving.

With this solid background of organization and achievement

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

there is little to fear except indifference or a false sense of security in our own ranks for medicine in Minnesota.

B. B. SOUSTER, M.D., *Secretary*,
R. R. ROSELL, *Executive Secretary*.

REPORT OF THE TREASURER

The attached statement of cash receipts and disbursements for the year which ended December 30, 1941, was made by Shannon and Byers, Certified Public Accountants, who finished auditing the books of the association February 25, 1942, and found them to be correct in all respects.

A comparative summary of the finances of the association in 1940 and 1941 is provided on page 2 of the statement. It will be noted from this comparison that there was a net profit of \$8,619.84 in 1940 while the net profit for the legislative year of 1941 was \$2,763.35.

In view of the increased budget for 1941, it is obvious that the financial condition of the association continues sound. The program expanded in many directions during 1941 and, in spite of unusual wartime demands and the enlarged odd-year budget there still remains a small surplus.

Delegates and members are urged to study this statement carefully for a better understanding of the administration of association affairs.

W. H. CONDIT, M.D., *Treasurer*.

STATEMENT OF CASH RECEIPTS AND DISBURSEMENTS FOR THE YEAR ENDED DECEMBER 31, 1941

CURRENT FUNDS

CASH ON HAND, December 31, 1940:

NET INCOME	\$ 2,763.35	\$ 8,619.84

THE CHAIRMAN OF THE COUNCIL

The program of the Minnesota State Medical Association has expanded to cover many new fields and activities, during the past year, and the work of the Council which approves each new project has been correspondingly varied and important.

Among projects discussed and approved during the past year the following should be mentioned:

Blindness Survey.—A survey of the eyes of all children under 21 is now being conducted in rural Hennepin county under the auspices of the Minnesota Society for the Prevention of Blindness, and the state association. This survey was undertaken because of the alarming number of eye defects found among selectees and because no information exists at this time about the actual condition of the eyes of children in the general population. At the request of Dr. F. E. Burch of the Minnesota Society, the Council this year appropriated \$500 to this worthwhile study.

Accreditation.—Two counties have already been certified for tuberculosis control under the accreditation program of our Committee on Tuberculosis which was approved by the Council in October and by the State Board of Health at a subsequent meeting. This plan, modeled upon the successful program for control of cattle tuberculosis by the veterinarians, together with the current Meeker county experiment in county-wide tuberculin testing have put Minnesota at the forefront of all the states in tuberculosis control work.

Prepaid Medical Service for FSA Clients.—At the request of representatives of the Farm Security Administration, Council approval was given for the first time to an experimental program in prepaid medical service for FSA clients in two Minnesota counties. Ottertail and Morrison were the counties picked by the Committee on Low Income and Indigent Problems to which the arrangements were referred. No conclusive figures on results are available yet, since the plan has not been in operation for a year, but physicians, clients and FSA officials are working harmoniously in giving the plan a thorough tryout. Permission of the Council has recently been given to add another county to the group, provided local physicians approve.

Program for Children with Heart Defects.—Social Security funds for crippled children have made it possible for the Division of Social Welfare, under whose direction the work will be carried on, to institute an initial program in the Children's Hospital in St. Paul. Only children from nearby counties will be eligible for care. Later the program may be extended.

History.—Material so far gathered by the Historical Committee has been published serially in MINNESOTA MEDICINE and plans for publication in book form have been extensively discussed, both as to material and as to costs. It was decided to make a special effort to secure all material up to January, 1900, from all societies in the state and to ask every society which has not already done so to complete its history to that date as soon as possible. Final plans for publication will be made when all copy is in the hands of the committee, unless war conditions make a further postponement advisable.

Fee Schedule.—The new Schedule of Allowances for Medical Services prepared by the Division of Social Welfare has this year supplanted the earlier schedule and represents a considerable increase in allowances to be paid physicians for relief work. This schedule was drawn up on the basis of careful studies by the Division and also upon findings of a Council committee and the Council has officially affirmed its fairness to all concerned. This action represented a significant milestone in the relations between relief authorities in the state and the doctors of Minnesota. It came as the culmination of

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

a new cooperative program set up two years ago through which an official advisory committee of physicians became part of the machinery of the Division of Social Welfare with county advisory committees acting comparably for discussion and adjustment of all problems having to do with medical relief.

Fifty Club.—The Council approved a new section of our organization and a new feature for all annual gatherings with the institution of the Fifty Club at this meeting. This club will be made up of all members who have practiced fifty years or more in Minnesota. Some 60 are eligible for election at this meeting and all who are able to be with us will be guests of honor at the Annual Banquet Tuesday night.

Finances.—The finances of the association continue to be in excellent condition in spite of inroads on income made by the war. A surplus of about \$2,800 remained on our books at the end of the fiscal year. The investment account is examined at intervals by the Council and adjudged to be wisely invested and in good condition to weather the dislocations of the times.

Dues.—The question of payment of the dues of members who leave for service with the armed forces has been discussed at length and, in accordance with the action taken by the House of Delegates in St. Paul, state dues have been remitted for those under grade of captain who applied by letter through their Councilors, showing their need for such relief. Many societies have taken action, however, to pay the dues of their colleagues in action by an assessment upon those who remain at home. This solution to the problem has become more and more popular and has been urged as far as possible upon all component societies by the Council. The work of the state society does not diminish in importance but in fact becomes more urgent as the war effort moves forward. For that reason it seemed necessary to the Council to deny a request from a few members for the return of dues already paid after they had left for active duty. It is as important for those who leave as for those who remain that standards of practice in Minnesota shall not change in their absence.

War Activities.—A resolution promising the aid of the Council and urging the cooperation of all members in promotion of all phases of improvement in civilian health, in cooperation with the Office of Civilian Defense and in the program of the Procurement and Assignment Service was passed by the Council in December.

In conformity with the spirit of that resolution, the state association has greatly expanded its program of public health education and has worked as closely as possible with civilian defense agencies and with the P.A.S.

At the request of Dr. A. J. Chesley, members of the Council agreed to meet with chairmen of city and county defense councils in their districts to coordinate and advise on all matters relating to local health and defense. Several such meetings have already been held and more are to follow.

Nursing.—The nursing situation is serious everywhere but particularly in the small hospitals of Minnesota. It has been brought to the attention frequently of the Council and the House of Delegates and, as a result of a series of joint conferences, a plan for a committee of nine members from the medical association, the Minnesota Hospital Association and the State Board of Nursing Examiners, to thrash out all phases of the question was approved by the Council. Drs. F. J. Savage, St. Paul; C. M. Johnson, Dawson; and P. F. Meyer of Faribault, were appointed to the committee from the medical association.

Appointments.—The Council proposed to the Governor the name of Dr. M. W. Alberts of St. Paul, to succeed himself on the State Board of Medical Examiners, with Drs. G. N. Ruhberg and James Dunn of St. Paul as alternates in that order. Dr. Alberts' term expires this year.

It is impossible to review in full here the routine work of the Council during the year touching, as it does, all manner of committee appointments, budget expenditures, finances, affiliate memberships, new and old problems of all sorts. The work must go on as it has in the past regardless of wartime hardships. This report would not be complete without again calling the attention of the House of Delegates and the membership to the excellent work done by our secretary, R. R. Rosell; the editorial work by Florence Fitzgerald; as well as the fine work done by Marion Hale, Irene Sanders, and Dorothy Peterson in their respective places. So long as the Council retains its present high level of deliberation and personnel, the interest of the public in these matters will be guarded equally with the interests of the medical profession.

W. L. BURNAP, M.D., *Chairman.*

COUNCILOR OF THE FIRST DISTRICT

Membership of the component medical societies of the first district (Freeborn, Goodhue, Mower, Olmsted, Houston, Fillmore, Dodge, Rice, Steele, Wabasha and Winona) has increased from 626 to 638 since the last annual meeting. The names of members who have joined the armed forces of the United States are included in the 638. At present (June 1, 1942) 138 physicians from this district have entered the service. In addition about 20 physicians who compose a hospital unit are expecting orders to active duty. Also, a naval unit composed of 11 physicians may be called in June.

Almost all activities have been dwarfed by those which pertain to the national emergency. In the first district there

are 45 communities, each with a population of more than 500. Of these, 7 fall into the group which is classified as having a population of 10,000 or more. In addition there are 43 incorporated towns each with a population of less than 500.

On April 4 a meeting was held in Rochester under the direction of the executive officer of the State Board of Health. To this meeting were invited—

1. Members of the District Health Section
2. County Defense Council Chairmen
3. City Defense Council Chairmen
4. County Health Officers
5. City Health Officers

Many important issues were clarified and, as a result, work was initiated which has progressed steadily. One of the most tangible values which emerged from the meeting was the plan which was presented by Dr. J. F. Schaefer of Owatonna. This scheme for emergency medical service was so comprehensive that the "Owatonna plan" was immediately adopted as a working basis for plans to fit the needs of other communities of this district. Subsequently, Dr. Lester Breslow, district Health officer, visited Dr. Schaefer and Dr. J. A. McIntyre, city health officer of Owatonna and chief of the emergency medical service. Dr. Breslow secured the details of the plan which, with modification, has been found to meet the needs of other cities of similar class. Two features which should be included in each emergency medical service are as follows: 1. The service should be built around existing hospital and other permanent medical facilities and plans should exist for the employment of auxiliary facilities in case those which are permanent are incapacitated or overtaxed. 2. Any such service should be developed with an idea of permanency; that is, it should be designed for use in civilian disasters such as fires, tornadoes and floods, and not for wartime incidents only.

The chairman of the district health section soon will send a report blank to the chief of the emergency medical service of each community in order to obtain information for the state and national health sections. When filled out, this form will give the following information:

1. The names of the members of the emergency medical committee (The membership of this committee corresponds with that of the state health section committee.)
2. Name of the emergency medical chief and his alternate.
3. How much has been accomplished in conjunction with:
 - a. Civilian Defense Council
 - b. Local Red Cross
 - c. District Health Office
4. The name of the hospital or hospitals, and provisions for emergency beds.
5. Auxiliary hospital facilities, armories, schools, churches and so on.
6. The number of medical nursing teams, available physicians, available graduate nurses, extent of auxiliary personnel, the number of ambulance drivers, stretcher bearers, victory aides, first aiders, cooks, undertakers and so on.
7. Surgical equipment, provisions for transfusions, dressings, instruments, medicaments, anesthetic agents, splints, blankets and so on.
8. Auxiliary ambulances and stretchers.

On May 25, the Minnesota State Hospital Association met in Rochester. Again Dr. Chesley was on hand and he arranged a meeting with Colonel Hunt, district representative from Omaha, and officials of the Hospital Association. Again much valuable information was released.

On May 22, Olmsted County became a tuberculosis accredited county by the award of the Accreditation Certificate for the control of tuberculosis. Dr. Chester Stewart, formerly of Minneapolis and now Head of the Department of Pediatrics of the Louisiana State University School of Medicine, was the guest speaker.

Problems regarding activities of several members of the state association, residing in the first district, have been brought to the attention of the Council and are now in the process of solution.

L. A. BUE, M.D.

COUNCILOR OF THE SECOND DISTRICT

Nine counties in the Second Councilor District have passed resolutions that they will take care of the local and state medical association dues for any member who is serving in the armed forces of the United States. These resolutions have passed practically unanimously. We feel definitely that this is a duty we owe to the members who have to leave their practices and serve to protect us all.

We have all been more or less interested in the strenuous effort that the historical committee of the State Association has been putting forth to obtain a medical history from each county in the state. It has been a very arduous proposition we understand to get anyone interested enough in each county to do this work. One member of our district, Dr. R. C. Hunt of Fairmont, Minnesota, has accomplished something that in our opinion seems to be quite a masterpiece in this regard. He has written a history of Martin County that is very complete and has collected photographs of all the early practitioners in that county. He has had the history typewritten and put together in loose-leaf book form and he is at present working to get the history of Faribault County.

For any delegate who is interested in this line of work, I shall have this booklet at the registration desk at the Duluth

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

State meeting so that it may be examined. It might help others to formulate a history of their own county medical organization.

Our district has taken a good deal of interest in the medical economics of the state though they are not neglecting the scientific part in the practice of medicine. They are having many scientific meetings especially in the spring and the fall of the year, also there has been considerable activity in the vaccination and immunization programs.

L. L. SOGGE, M.D.

COUNCILOR OF THE THIRD DISTRICT

The membership of this district has held well, and shows a slight increase over the preceding year. This, I think, shows a healthy condition, and that membership is considered of value to its holders.

The payment of society dues of members in the Service, by the local societies, has, I believe, been generally practiced. This fine gesture of appreciation has been encouraged, with the hope of lessening the burden of the Parent Society, as well as aiding in the maintenance of the membership of those men who are making these sacrifices.

The component societies have cooperated fully with the State Association, and have maintained their high standards in regard to programs and attendance.

The Tuberculosis Program has been carried on with a great deal of satisfaction and success, and immunization against smallpox and diphtheria has been quite generally practiced.

The medical care of the indigent is coming to be more generally considered the responsibility of the public, thus lessening the burden of the medical profession, to some extent.

The Minnesota Hospital Service Association, providing hospitalization on a prepayment plan, is rendering satisfactory service, and is being well received in the farming communities. It is to be hoped that if a plan for prepayment of medical services is ever adopted, that it may serve with equal satisfaction.

The war has not lessened, but rather heightened, the interest in organized medicine by the members of these societies.

This, in the opinion of the councilor of this district, justifies an optimistic outlook upon the future of our profession.

CARL M. JOHNSON, M.D.

COUNCILOR OF THE FOURTH DISTRICT

Affairs in the Fourth District have been running smoothly during the past year. Special interest has been focused on matters pertaining to the war effort and the preparation of proper lists for the Procurement and Assignment Committee, from which to choose available Doctors for Army and Navy service.

One case of threatened malpractice against a doctor in the District has been satisfactorily adjusted through the efforts of the Society's Committee, after personal interviews with those involved.

The Minnesota Hospital Service Association has extended its arrangements with additional hospitals in the District, and one hears but favorable comment in regard to the service.

We have been instrumental in helping to gather data for the Historical Society, and further work in this regard is to be done.

Civilian defense, as it pertains to Doctors and the Hospitals, is being developed.

The program for immunization and vaccination in schools is well taken care of.

Of most importance at the present time is the proper adjustment to war practice for civilian as well as military service, and while this has been put in the hands of a Procurement Committee, your Councilor is frequently called upon to help and advise in this matter.

I wish to express my appreciation for the cooperation of the Society and officers of this District.

A. E. SOHMER, M.D.

COUNCILOR OF THE FIFTH DISTRICT

The most gratifying accomplishment in this district during the past year was the reactivation of the Dakota County Medical Society. A meeting of all physicians of Dakota County who had signified their desire to reconstitute the Dakota County Medical Society was held at the Lowry Hotel, St. Paul, on Friday, April 10, 1942. Dr. L. S. Burns of South St. Paul was elected President and Dr. A. J. Emond of Farmington was elected Vice President, and Dr. A. H. Field of Farmington was elected Secretary-Treasurer. It was a great satisfaction to have this society functioning again as there has been a very definite need for it.

Cooperation was extended to the Minnesota Hospital Service Association in obtaining membership of the Rush City Hospital and the Emond Community Hospital of Farmington, Minn.

Two meetings of the Washington County Medical Society were attended. A very entertaining program was presented at each meeting.

The first meeting of the newly activated Dakota County Medical Society was to be held June 9 at Hastings and the Councilor was scheduled to attend this meeting.

Nothing else of unusual interest has occurred in this district during the past year.

E. M. JONES, M.D.

COUNCILOR OF THE SIXTH DISTRICT

I wish to submit the following report from the Sixth District, comprising Hennepin and Wright Counties.

Membership	May 1, 1941	May 1, 1942
Hennepin County.....	642	663
Wright County.....	18	19
Total	660	682

There are ten applicants for membership at the present time, a number which is considerably below the normal, due to the fact that many prospective applicants are in military service.

As of June 8, 1942, Hennepin County had a total (in all classifications including three Junior members, two visiting members, and three applicants) of 76 members in military service, or under orders to report for duty. In addition, approximately 55 medical men from Hennepin County, who are not members of the Society, are in the service, so that there are about 131 physicians from this District in the service.

The need for any special organization among the remaining physicians in civil practice, to take care of the civilian population, has not yet been acutely felt, and will be met as the occasion arises.

An organization known as Group Health Mutual, formed for the purpose of providing prepaid medical care, attempted, something over a year ago, to enter into a contract with an organized group in Hennepin County for medical care for its clients. The proposed contract was presented before the Executive Committee of the County Society, where it met with opposition. The plan was then altered, so as to include, among those whose services would be accepted by Group Health Mutual, other groups of physicians who could come within the definition of a Clinic, as stated in the contract. This was presented before a special meeting of the County Society, by representatives of Group Health Mutual. The meeting was attended by a large number of members of the Society, and the subject was freely and fully discussed. The consensus of the meeting was that the plan failed to provide free choice of physician by the patient, and that it violated the principles of medical ethics. It is rumored that Group Health Mutual has now under consideration a plan providing free choice of physician by the patient. This would, apparently, remove the most serious objection to the presentation of such pre-payment plan to the public.

STEPHEN H. BAXTER, M.D.

COUNCILOR OF THE SEVENTH DISTRICT

Influences of the war upon physicians in the Seventh Councilor District have intensified medical and scientific interests and decreased concern over economic problems, it appears. This change of interests may be due to the number of physicians called into the service and the consequent heavier demands for medical service on those remaining; or it may be due to the decreased number of indigent persons resulting from war-production employment.

In this district, eleven communities have no physician. Seven of these villages have never had a physician and the remaining four have had a physician in residence only intermittently. All of them are near enough to cities or villages having physicians that adequate medical care is within reach of their residents. In larger villages and cities in the district, induction of physicians into the service has increased the practice-load of the remaining physicians.

In the field of medical economics, the Morrison County Medical Care Plan of the Farm Security Administration has revealed interesting data. Each participating family pays \$22.00 a year for medical care. Of the 450 Farm Security Administration families in the county, 219 are participants. During the first eight months of operation \$2,900 in bills have been presented. Of these, \$2,300 worth have been paid, and \$400 remains in the fund to be distributed among participating physicians in proportion to services rendered at the end of the first year. Thus, 60 per cent has been paid, and distribution of the accumulated \$400 now would raise this figure to 70 per cent. This compares favorably with the amounts paid by indigents, marginally indigent persons and agencies responsible for them. A survey made of the 231 nonparticipating families reveals that only \$400 worth of medical care was had, and of this amount less than 50 per cent was paid.

EDWIN J. SIMONS, M.D.

COUNCILOR OF THE EIGHTH DISTRICT

Practice in the eighth district continues in a manner satisfactory to the profession and pleasing to the citizens (though some still prefer a chiropractor).

I have covered the district as thoroughly as possible and have been impressed with the progress and universal high standards of practice maintained as well as the fine spirit of comradeship exhibited.

There are beautiful, new, well-equipped hospitals recently opened and the older ones show continuous improvement. This is mostly a reflection of the doctors' efforts and they are prepared to turn added facilities to the betterment of the patients.

There are two chief sources of this leaven which is quietly raising our standards.

(1) The excellent work done by the committees of our society in gathering valuable information and dispensing it to the best advantage. This work could not be so well done without the judgment and organization ability of our Secretary, R. R. Rosell; the editorial ability of Florence Fitzgerald

and the cheerful services rendered, each in her place, by Marion Hale, Irene Sanders and Dorothy Peterson.

(2) The short courses offered at the Center of Continuation Study at the University. The opportunities there under the able direction of Dr. O'Brien supported by the faculty of the medical school, of course including the Mayo Foundation, surpass those offered anywhere else in the world and the profession would be a dumb lot if these failed to have the desired effect.

Let us continually look forward so that Minnesota may ever lead the nation and the world.

W. L. BURNAP, M.D.

COUNCILOR OF THE NINTH DISTRICT

Activities of this component of our organization have again kept pace during the past year with current responsibilities and obligations. It may be noted that, as the preliminary reports came in on the raid on Pearl Harbor, the president and executive secretary of our state association were in conference in Duluth with the local committee on arrangements for the preparation of our annual meeting. In the passing six months members have shouldered many added duties, professional as well as civic, in this total war effort. The district has assumed vital importance in the impetus given iron ore production, shipbuilding and manufacturing of military materials.

Twenty-nine members of the society have entered various departments of military service. Through additional assessments their membership has been continued and will be for the duration. The membership has been advised of the need of continuing the important work of the state association.

On May 11, in accordance with the organization of the Health Section of State Welfare Defense Committee, a meeting was held for the purpose of further coordination of the medical phases of civilian defense in the ninth councilor district. Forty representatives conferred the entire afternoon on all matters that concerned health, hospitals, nursing and sanitation as they pertained to the program. The health officers and chairman of defense councils of six cities and seven counties received valuable information from several of the federal and state authorities. The latter included: Senior Surgeon Wallace D. Hunt, Medical Officer of the 7th Corps Defense Region; Mr. James Campbell, Secretary of the Welfare Defense Committee, Minnesota Defense Council; Major Paul Dwan, First Minnesota Battalion. Appreciation is extended Dr. Chesley, Chairman of the State Health Section for his major part in organization of the program. It is felt that this meeting had accomplished a good purpose in clarifying the responsibilities of those concerned in the entire district.

Immunization was recently well extended in a program by the Director of Public Health of Duluth, Dr. M. McC. Fischer. Seven thousand were vaccinated against smallpox and the same number against diphtheria in a single drive. It is estimated that at present 68% of the population is vaccinated against smallpox. In the county area there has been also considerable extension of this program under Dr. C. A. Scherer.

Some time ago, an exhaustive survey was made of medical relief in St. Louis County by the U. S. Public Health Service, which concluded with a formal report of recommendations. Evidence of an assumption of this constructive program is the engagement of the Director of Public Health of Duluth in part-time office to act as medical director for the County Welfare Board. This is a very progressive step, which will be of value to the agency, client and profession. Our contact committee has done excellent work the past year.

On approval of the Council, representatives of the FSA presented an offer to the physicians of Carlton county to participate in a prepaid medical plan, now in effect in two other counties of the state. They decided not to accept the plan for the time being.

F. J. ELIAS, M.D.

DR. S. A. SLATER, Worthington, Chairman of Reference Committee on Officers' and Councilor's Reports:

Report of the Secretary.—The committee takes cognizance of the increasing amount of work that the secretary and executive secretary are called upon to do and want to compliment them on how well they are meeting the unusual situation that is brought on by the war conditions. The report is most gratifying, and we recommend its adoption.

Report of the Treasurer.—This report was examined by the committee, and it was very gratifying to note that the dues for membership for 1941 increased over 1940, and there was a nice surplus each year. The condition of the Association seems to be in excellent shape, and it is recommended that the treasurer's report be adopted.

Report of the Chairman of the Council.—The committee was very much impressed by the report of the

chairman, Dr. W. L. Burnap, on the work of the Council. They seem to be doing everything possible to keep the Minnesota Medical Association in the forefront in advancing medicine. A number of new projects have been undertaken, and excellent judgment has been shown. They modestly admit that it is too early to draw final conclusions. The committee realizes from Dr. Burnap's report that the duty of the Council is ever increasing, but they are doing a most excellent job, and it is recommended that the report of Dr. Burnap, the chairman, be approved.

Reports of the Councilors.—Dr. Buie's report as councilor of the first district was most complete. It shows that the district is in a healthy condition in that the membership in the component societies has increased. The committee was impressed by the large number of physicians in military service at this time, the number being approximately 170. The committee was particularly interested in the emergency relief plan originated by Dr. Schaefer and Dr. McIntyre of Owatonna. They are to be commended on their organization endeavoring to use the existing facilities for not only war emergencies but any other emergency that might arise. It is an undertaking that might well be applied to other communities.

It is highly gratifying in reading the reports of the councilors of the other eight districts to find all in excellent condition. All indicated that the war had brought on conditions which the several districts were meeting in a most gratifying manner. It was gathered from these reports that the physicians throughout the state are arising to the occasion and assuming whatever added responsibility placed upon them. We recommend the approval of these reports.

It was moved, seconded and carried that the reports be accepted.

The Speaker then called for the report of the Reference Committee on State Health Relations reports, of which Dr. O. J. Seifert of New Ulm was chairman. The following reports were considered:

COMMITTEE ON STATE HEALTH RELATIONS

PART A

In response to a letter from Dr. C. E. Proshek, the Council in December, 1940, referred to the Committee on State Health Relations the problem of possible improvement of the coroner system in Minnesota.

The problem has been discussed several times by the committee and has been further studied by a subcommittee under Dr. Boleyn, with the assistance of Mr. Brist, attorney for the Minnesota State Medical Association, Drs. Bell, McCartney, and Clausen of the University Pathology Department, Drs. Giffin and Souster and Mr. Rosell.

While our studies are not yet complete, we believe that:

1. A State Medical Examiner's Office should be established in charge of a Chief Medical Examiner (who would be a competent pathologist with a certificate of the American Board of Pathology) assisted by:
 - a. an Assistant Chief Medical Examiner (with similar unquestionable qualifications) who would be the traveling pathologist, available for assistance to coroners and law enforcement officials throughout the State, and
 - b. a toxicologist (a chemist with adequate special qualifications) who would be similarly available.
2. The State Medical Examiner should have a central office in St. Paul or at the State University and the toxicologist should have an office and laboratory at the State University.
3. The State Legislature should provide funds for the Chief Medical Examiner and his Assistants. We are studying the practicability of a nominal fee charge to counties for work done.
4. Changes in the qualifications and duties of County Coroners and their relationships with the State Medical Examiner's office are desirable if possible.
5. The State Medical Examiner should be given definite and incontrovertible legal authority to order a postmortem examination by a competent pathologist whenever he may feel it to be necessary in the interest of justice.
6. That it should be made mandatory that coroners and others notify the County Sheriff, County Attorney, State Bureau of Criminal Apprehension, and State Medical Examiner of all cases of sudden unattended or suspected violent deaths.

We hope that the members of the State Medical Association will take an active part in discussion of the problem and promotion of some adequate solution. With that in view, we

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

have in an exhibit at this meeting copies of various laws in force elsewhere and various other pertinent material, including our suggestions. Inquiries and suggestions sent to the Committee through the Secretary's office will be appreciated.

We hope, because the Legislature will meet next winter, that the House of Delegates will authorize the Council, and the Committee on Public Policy, to bring before the Legislature the proposals that will have been developed after further hearings and discussions.

PART B

It has been reported from reliable sources that efforts to consolidate still further several departments of the state government and to "complete" the so-called "streamlining" begun four years ago in Minnesota by Governor Stassen will be renewed in the next session of the Legislature.

Any attempt to subject departments dealing with public health and medical services to lay domination from other departments of the state government has been regarded from the first as unwise and undesirable by all physicians of the state.

In view of the fact that an effort was made at the last session to subordinate both the State Board of Health and the Division of State Institutions to the Division of Social Welfare, and in view of the fact, also, that further attempts are likely to be made to destroy the independence of the Basic Science Board and the State Board of Medical Examiners, the following plan is proposed by this committee:

1. That the State Board of Health be maintained as an independent board of nine members appointed by the Governor, as they are at present, from recommendations made to him by professional bodies.

2. That, if it is deemed advisable to change the Division of State Institutions, the institutions having to do with health and medical care be subordinated to the State Board of Health as the only competent professional department in the state government, and not to any lay division or department.

3. That the State Board of Medical Examiners and the Basic Science Board be maintained as independent, self-supporting boards and that no move be made to coordinate their functions and income with those of other licensing boards.

T. R. SWEETSER, M.D., *Chairman.*

COMMITTEE ON UNIVERSITY RELATIONS

The Committee on University Relations begs to report that nothing has been referred to this committee during the present year.

Harmonious relations seem to exist between our Association and all departments of the University and especially are we in excellent relations with the Medical School.

B. J. BRANTON, M.D., *Chairman.*

COMMITTEE ON PUBLIC POLICY

Since the last annual meeting of the State Medical Association there has been no legislative session; hence, nothing to report in State legislative matters. But your committee has not been wholly inactive as far as national legislation is concerned.

We have kept in touch with our two United States Senators and all the members of the House of Representatives on several issues pending in Washington. The Minnesota delegation in Congress has been very cooperative and all have promised to do their utmost in opposing certain legislation that we felt would be very detrimental to the public health of the Nation.

We have also urged, and the whole delegation at Washington is doing all in their power to have medical, hospital, dental and pharmacy bills deductible under the new income tax law. In view of the fact that the personal exemptions are constantly being whittled down, and the tax rates increased, it seems to us only fair that the taxpayers be given some consideration along the lines suggested. The Government is stressing the importance of the American people keeping well, and we know of no better way to encourage them than to permit such a deduction. We have contacted Congressman Knutson of Minnesota, who is on the powerful House Ways and Means Committee where the tax bill originates, and he is doing his best to make those expenses deductible. The Treasury Department has recommended a deduction for extraordinary medical and hospital expenses—we do not believe this is the proper solution to the problem, but that it should be approached from the standpoint of encouraging people to safeguard their health and making such expenses deductible up to a certain percentage of income, the same as money expended for church or charitable purposes.

We had hoped that such a provision would have the support of the Board of Trustees of the American Medical Association, but we understand that so far the Board of Trustees has declined to take such action. Dr. William Braasch of Rochester, who is a member of the Board of Trustees, has told us that he has done all he could possibly do to secure such approval. There have been times when we felt tempted to make direct contact with other State Medical Associations in matters such as this, but so far we have not done so.

Your Committee on Public Policy is now appointed in the even numbered years to serve for two years, the reason therefor being self-evident. There have been only one or two changes in the personnel of this committee since the death of Dr. Johnson. We have made no change in the *modus operandi* for the reason that Dr. Johnson was the originator of our present setup and he did such a splendid job that we have not been able to improve on his methods.

Your Committee most respectfully asks that this House of

Delegates bring to every member of their respective societies, the importance of taking an active interest in the 1942 elections. This year the state primary will be in September and the final election in November. In addition to electing a governor, a lieutenant governor, an attorney general and other state officials, 67 state senators and 131 state representatives are to be elected. This constitutes the entire membership of the Legislature. In view of wartime conditions and the many problems that naturally arise during such times, it is most important that our lawmakers from every legislative district, be men and women with good judgment and a desire to do what is best for all the people of the State. Most members of the present Legislature have been extremely conscientious in promoting good public health. Unfortunately, however, there are a few members who have not; the former group should be actively supported in the event they file for reelection, while the latter group should be retired to private life.

L. L. SOGGE, M.D., *Chairman.*

DR. O. J. SEIFERT, Chairman of Reference Committee on State Health Relations: Your Reference Committee on State Health Relations respectfully requests that the House of Delegates accept these reports.

We wish to call your special attention to the report of the Committee on State Health Relations with reference to the improvement of the coroner system in Minnesota, calling for the establishment of a State Medical Examiner's office in charge of a competent pathologist strongly advised.

Dr. B. J. Branton reports harmonious relations existing between our Association and all of the departments of the University, especially with the medical school.

The Committee urgently requests you to study the report of the Committee on Public Policy with reference to legislation. This is very timely and of interest to each and every one of us.

Your Committee respectfully requests the acceptance of these reports.

DR. SEIFERT: I think we have all had knowledge of incompetent post-mortem examinations in case of accident and with testimony given in court on the basis of such examinations. The establishment of a State Medical Examiner's Office, headed by a Chief Medical Examiner, is greatly needed and strongly advised.

In respect to the report of the Committee on Public Policy, the committee strongly urges every member to read and study it. We must watch legislation and maintain our organization. Our dues are our insurance premium, cheap insurance in fact. So let us be alert as Dr. Gavin told us and let us not be niggardly about our dues.

The report of the committee was unanimously adopted by the delegates.

The Speaker then called for the report of the Reference Committee on Lay Education reports, Dr. N. H. Baker of Fergus Falls, chairman (substituting for Dr. R. M. Burns of Saint Paul.)

The following reports were considered.

COMMITTEE ON PUBLIC HEALTH EDUCATION

It will be recalled that by the reassignment of committees made last year by the Council, the chairmen of seventeen scientific committees, together with chairmen of the editorial and radio subcommittees now compose the executive body of the Committee on Public Health Education.

I am pleased to report that two successful and important meetings of the whole committee were held during the year, and at each meeting at least 75 per cent of the committees were represented and made reports.

The first meeting was held in Duluth in July, 1941, and the second was held in connection with the County Officers meeting at St. Paul, February 28, 1942. At both of these meetings the various chairmen or their representatives gave full and detailed reports, and I wish to assure the members of the State Society that none of these committees is idle or dormant.

In this year of upheavals and upsets; of men entering the various services of our country and of traveling about—it does not seem wise or necessary to put into this report much detail or explanation. In the circumstance that I now proceed to list some of our major activities, it must not be assumed therefrom that omission of certain others indicates either lack of appreciation or interest. It simply means that within the reports ultimately coming to the membership through the Council, the efforts of all these committees will be made known.

1. Our central office, through Mr. Rosell and his staff, very adequately presented and commemorated our centennial

with the beautiful photographic reproduction of buildings, doctors, hospitals, personalities—all making graphic and obvious the route whereby our society has attained its commanding position within our state. This booklet should be kept and prized by all our members and all the institutions to which copies were assigned.

2. Reference should be made to the part our committee members took in the County Officers meeting in St. Paul as of February 28. This is an annual roundup, sponsored and financed by our State Society, and the greatest good comes from it. It is likely that county societies, keeping certain individuals like their secretaries in key positions for several years, do secure the advantage that comes from keeping that individual in touch with state events. It might seem more desirable, however, to shift the offices, and give more men contacts thereby with such meetings as this annual conference.

3. The Vaccination and Immunization campaign began with newspaper and radio publicity in November and included wide distribution of two posters, one urging vaccination and the other immunization, together with small leaflets on each for distribution, with doctors' statements, at meetings, etc. The result over the state has been an unprecedented increase in vaccination and immunization, judging by amounts of vaccine and toxoid distributed by the State Board of Health.

4. Nutrition. The great increase in interest in the general nutrition of our people, the advances made in investigation of deficiencies and avitaminoses, have enlisted the interest of your Health Committee. Working with the State Board of Health, four folders have been developed: one on nutrition for expectant mothers, another for the child two to six, a third on nutrition for the average family, and a fourth on reducing, have been sent to members. Various food handlers are also to get posters, also restaurants and drugstores, emphasizing the slogan "For a Stronger America Eat More of the Right Foods," and urging people to ask for nutrition folders that are available from their doctors without charge or cost.

5. The regular Weekly News Service this year has been converted to a Question and Answer service called "How's Your Health"; 160 weekly papers are using the service regularly.

6. The Radio Broadcasts, under the guidance and direction of Dr. William O'Brien, continue with ever-increasing interest and enthusiastic approval of the medical and the lay public.

7. Packet Service—Packets were prepared and distributed as part of the Coordinated Medical and Public Health Program of the Association.

Their popularity is amply attested by the growing demand which has mounted from a monthly average of 400 last year to 650 for the past eight months with requests reaching a high of 976 for one packet and 833 for another. The thanks of the committee and the association are due to the men who have contributed the fine material assembled for these packets.

8. The Tuberculosis Survey is now arriving at a point where results are scoring heavily. In the May 2, 1942 issue of *Collier's Magazine* you will find an article by Mr. Robert Thompson giving a popular version of the work done in Meeker and adjacent counties in following up tuberculosis surveys, and finding the sources within family groups of open cases of tuberculosis. This is a story of the widest human appeal. It is captioned "Worth More Than a Cow"—harking back to the obvious circumstance that there is no longer any tuberculosis in the cattle in Minnesota, but implying that the Mantoux program, if carefully followed up with x-ray films of the positives, goes a long way toward ridding our state of human tuberculosis. The physicians in Meeker and adjacent counties who have given so much of their service and time to this worthy work deserve the praise and commendation they will get not only from the public but from the doctors who more fully appreciate the contribution they have made. Dr. Myers and Dr. Stewart (now in Louisiana) worked for a long time without the medical support which is now accorded them so freely wherever the anti-tuberculosis program pushes on.

9. The Red Cross. Naturally the Red Cross has come to the fore with a situation and a demand unprecedented. Dr. John S. Lundy has enlarged the program at Rochester through some utilization of a method of teaching Red Cross through radio broadcasting. He points out, however, that for varied and obvious reasons our doctors should step into the Red Cross program of teaching, instruction and information to Red Cross groups, with the desire and intention to follow the Red Cross book of instructions and manual. This subject was editorialized in the pages of *MINNESOTA MEDICINE* for the April issue, and the reasons were outlined why, despite the doctor's urge to vary his instructions somewhat according to his own experience and most recent reading, nevertheless, for the good of all concerned and for uniformity, the method devised by the Red Cross should be adhered to as strictly as possible.

10. Wherever possible the Educational Committee expects to cooperate and to lead wherever the war exigencies will dictate. At any time we may be called upon to advance the collection of blood for desiccation on a huge scale to meet the treatment of shock, both civil and military, that may arise at any time. Suggestions are asked for from the membership for any movement along these general lines that seems to any individual to be essential and worthwhile. Such suggestions should be sent directly to Mr. Rosell.

The Committee thanks Dr. Albert Chesley and the State Board of Health for their cooperation in sponsoring the nutritional program and for timely cooperation in all other fields wherever possible.

E. L. TUOHY, M.D., *Chairman.*

EDITORIAL SUBCOMMITTEE OF THE COMMITTEE ON PUBLIC HEALTH EDUCATION

The duties of the Editorial Sub-committee of the Committee on Public Health Education have not changed. It is understood that the desire of the Association is that this subcommittee continue to act in an advisory capacity only. Most of the affairs that would be referred to such a subcommittee can be, and are, taken care of by Mrs. Fitzgerald, of the central office of the Association.

Since the last annual meeting, however, the chairman of the subcommittee was asked to look over the page proof of the pictorial booklet "One Hundred Years of Medicine in Minnesota." These proofs had to be received when available and released immediately. Therefore, it was not possible to call a meeting so that all members of the subcommittee could view the proofs. The chairman did call in for consultation, however, the President of the Association and a member of the Council, who reside in the same city with him.

Also, the chairman of the subcommittee attended a dinner meeting called by Dr. Tuohy, General Chairman of the Committee on Public Health Education. This meeting was held in St. Paul on February 27, 1942. The morning after the dinner the chairman of the subcommittee attended the meeting of the Committee on First Aid and Red Cross. Thereafter he helped Dr. Lundy, chairman of that committee, write a few paragraphs which were turned over to Dr. Tuohy and used by him to further the work of the Committee on First Aid and Red Cross.

Although, as far as the chairman of the subcommittee knows, review of any other material by a member of the subcommittee has not been needed, many activities with an editorial slant have been noted, with interest and approval: (1) the methods used in the vaccination and diphtheria campaigns; (2) the article from the January, 1942, issue of the "Journal of American Insurance" entitled, "Abuse of Medical Testimony—the Minnesota Experiment"; (3) the article from the May 2, 1942, issue of *Collier's*, entitled "Worth More Than a Cow" which was preceded by the editor's gloss reading, "That's what they think of human beings in Meeker County, Minnesota." Since Meeker led the nation in saving cows from tuberculosis it is now doing as much for man.

Moreover, the old standbys, the packets of the month, are always of interest and, when desirable, they emphasize timely topics: Nutrition (October); Influenza and pneumonia (November); Coronary disease (December); Endocrine therapy (January); Emergency surgery (February); Cancer of the breast (April); Poliomyelitis and encephalitis (May).

Other efforts, such as the radio work, the college lectures and the sight survey have been noted. Still others, not mentioned here, doubtless will have their place in reports of other committees.

RICHARD M. HEWITT, M.D., *Chairman.*

SPEAKERS' BUREAU OF THE PUBLIC HEALTH EDUCATION COMMITTEE

The Speakers' Bureau has functioned chiefly this year as the agency through which the College Lecture Course has been arranged and speakers selected.

As in previous years, two lectures were offered to each of the colleges of the state (except the University of Minnesota) and a total of twenty-seven lectures was given in fourteen colleges during the year.

Subjects for the 1941-42 course were:

Healthy Skin and Hair
The Appendicitis Problem
Fit to Fight
Adjusting Women to Their Jobs
Mental Fitness
Saving Sight and Hearing
Quackery, Drugs and Doctors

The following colleges participated:

College of St. Teresa.....	Winona
St. Mary's College.....	Winona
State Teachers' College.....	Winona
Gustavus Adolphus.....	St. Peter
Carleton College.....	Northfield
State Teachers' College.....	Moorhead
Concordia College.....	Moorhead
State Teachers' College.....	Benidji
Worthington Junior College.....	Worthington
College of St. Benedict.....	St. Joseph
St. John's University.....	Collegeville
St. Olaf's College.....	Northfield
Augsburg College.....	Minneapolis
St. Thomas College.....	St. Paul

Speakers were P. A. O'Leary, C. W. Mayo, Rochester; W. A. O'Brien, University of Minnesota; Nora Winther, University of Minnesota; F. J. Hirschboeck, Duluth; F. W. Lynch, St. Paul; J. R. Earl, St. Paul; R. A. Jensen, University of Minnesota; F. T. Becker, Duluth; O. B. Patch, Duluth; J. A. Hilger, St. Paul; D. W. Cowan, University of Minnesota.

Talks have also been arranged in response to requests from parent teacher groups, community health associations, luncheon clubs and church groups.

For county medical society meetings a list of speakers and subjects was prepared for the first time this year under aus-

pices of the Speakers' Bureau. The list was sent to officers of all component societies to aid them in arranging their scientific meetings. Speakers on the list all expressed their willingness to appear without remuneration.

Out of the activity of this bureau over a period of years a small but excellent group of speakers has been developed who can be relied upon to speak effectively before lay groups of all types.

There is no indication that the war emergency will lessen the call for speakers on health and medicine, however, and there is a definite need for more men to undertake this exacting but important phase of public health education.

F. H. MAGNEY, M.D., *Chairman.*

RADIO REPORT

For the past year the Minnesota State Medical Association has sponsored a program each Saturday from 10:15 to 10:30 a.m. over radio stations WCCO, Minneapolis and St. Paul; and WLB, University of Minnesota; also KDAL in the first nine months. The speaker has been William A. O'Brien, Director, Postgraduate Medical Education, Medical School, University of Minnesota.

The last broadcast in each month was sponsored by the Minnesota State Dental Association. The Dental Association has again expressed its appreciation to the medical profession for this cooperative effort. The subject material for each month except during the summer was keyed with the educational packet issued by the Minnesota State Medical Association for physicians.

Radio Station WCCO has given time to the Minnesota State Medical Association each week since April 4, 1928 (over fourteen years) for which we should be duly grateful, as it is the most powerful station in the Northwest.

A new program was started September 25, 1940, over radio station WLB, entitled "Your Health and You." It was given Wednesday from 11:00 until 11:15 a.m. for pupils in school grades, six through nine. Students listened in groups with the teacher. For wider coverage, radio station WLB sent the program over the North-central Broadcasting System (Mutual). The programs were arranged by Dr. William A. O'Brien, who gave each talk. The program is endorsed by the Minnesota State Medical Association and the Minnesota Public Health Association. It was learned through a survey that more than 9,000 school children "attended" these public health classes. If wider publicity and greater cooperation are given to this effort, more junior high schools will take the program next year.

In addition the radio spokesman appeared on the following programs:

University of Minnesota
Physical Education
University of Minnesota
University of Minnesota
Minnesota Public Health Association
Minnesota Society for the Control of
Cancer
4-H Club
School of Agriculture
Minnesota Foundation
Minnesota Hospital Association
Minnesota Hospital Association
Minnesota Hospital Association
Minnesota Hospital Association
Minnesota Hospital Association
Safety Council

August 28	WLB
October 10	KSTP
19	WCCO
November 5	WLB
10	KSTP
December 14	KSTP
February 13	WCCO
March 10	WCCO
29	WCCO
April 12	WMIN
20	WLOL
21	WLB
26	KSTP
May 11	WLOL
June 22	KSTP

SUMMARY

1. The regular weekly radio program sponsored by the Minnesota State Medical Association and given over WCCO by Dr. W. A. O'Brien is now in its 14th consecutive year.

This is the oldest and most popular sustaining program on any station in the Northwest and one of the oldest in the entire United States, and the appreciation of the membership should be conveyed again to Dr. O'Brien for his fine work and to Stations WCCO, WLB and KDAL for their cooperation in this program.

2. In addition to this regular broadcast, the committee this year arranged a series of radio interviews over Stations KSTP, WTCN and WMIN to initiate the state-wide campaign carried on by the association for vaccination and immunization. These programs were supplemented by interviews and announcements on several smaller stations throughout the state.

3. Two round-table discussion broadcasts were also arranged to coincide with the campaign for better nutrition. The latter were given over KSTP. The effectiveness of the entire effort was demonstrated by the surprising number of requests for literature and information that came as a response to the broadcasts. Further development of the round-table broadcast is contemplated as part of the public health education program of the association next year.

4. Station WLB, University of Minnesota, is to be commended for sponsoring Dr. O'Brien in the program for junior high school students. Physicians residing in cities with junior high schools should call this program to the attention of the school authorities.

ROBERT M. BURNS, *Chairman.*

Dr. N. H. BAKER, Fergus Falls, Acting Chairman of Reference Committee on Lay Education: The Refer-

ence Committee to study Lay Education Reports considered the Public Health Education report and recommends it be accepted as submitted and reports it is apparent that the committee as it was reassigned is functioning satisfactorily.

The Editorial Committee Report was also considered as submitted and this committee commends the favorable press maintained.

The Radio Committee Report was considered as submitted and the Reference Committee feels that some expression of appreciation should be made to the people who contributed the radio time for these programs. A word of commendation should be given to Dr. O'Brien for his fine work. It is the feeling of the Committee also that the close coordination between the other various health agencies in the state which heretofore cooperated on this program should be maintained in the future. We recommend acceptance of these reports.

The motion to accept the reports was seconded and unanimously carried by the delegates.

At this point the presentation of reports was interrupted to hear Miss Nora Rolf, representing the Minnesota State Nurses Association.

MISS NORA ROLF: The Minnesota Nursing Council for War Service is a committee created by the Minnesota State Nurses Association and is organized for the purpose of coordinating the efforts of all groups interested in nursing. The membership includes physicians, hospital administrators, nurses, and laymen. The president of the Minnesota State Nurses Association is the chairman.

The organization of the Nurses Battalion of the Minnesota Defense Force is under the Military Division. Major Ruth Boynton is a member of the Nursing Council for War Service.

The objectives of the nursing councils, national, state and local, are: 1. To supply and distribute nursing service to military forces, civilian population and office of civilian defense. 2. To recruit qualified students for schools of nursing.

The responsibilities of the nursing profession might be compared with the four duties outlined by Vice-President Henry Wallace in a speech delivered in New York City recently: "The duty to produce to the limit, the duty to transport as rapidly as possible to the field of battle, the duty to fight with all that is in us, and the duty to build a Peace, just, charitable and enduring."

We nurses have duties to perform in this all-out war effort.

Federal funds for nursing education have assisted materially in this produce-to-the-limit duty. The sum of \$1,850,000 was provided by the federal government for the training of nurses for the fiscal year 1941-1942 which ends June 30. One hundred and twelve schools of nursing in the United States were given assistance, six of which were in Minnesota. Federal funds are granted for three types of programs: 1. Basic professional programs in nursing schools connected the hospitals of at least 100 patients. 2. Refresher courses for inactive nurses. 3. Postgraduate courses in special and clinical fields offered by institutions which are already giving advanced courses.

Minnesota has had the benefit of all classifications. In addition, a program for recruiting and training nurses in public health for jobs in rural communities has been started by the Minnesota Department of Health, and allows stipends to trainees through U. S. Childrens' Bureau funds.

Recruiting of qualified students will be essential in order to fulfill our responsibilities, if nurses are released to the armed forces on the fighting fronts. The Army needs 6 nurses for every 1,000 enlisted men, and the Navy 3 for every 1,000.

The medium for providing nurses for the Army and the Navy is primarily through enrollment in Red Cross Nursing Service. Minnesota must enroll 825 nurses

in the First Reserve (that is under 40 and unmarried) before September 1 in order to attain the quota of 1,122.

Every nurse eligible for the First Reserve should be enrolled, regardless of the field of nursing in which she is employed. Plans for the assignments to the Corps Area Commanders are made by the National Red Cross Nursing Service Committee, which is a representative group of nurses from all of the various national nursing organizations.

So far, 211 Minnesota nurses have been assigned to military service, ninety from the Saint Paul committee, 181 from the Minneapolis committee, and forty from the Duluth Committee. One hundred and twenty nurses will be assigned to the General Base Hospital, seventy-one from Rochester.

Three nurses are in England with the Harvard Medical Unit.

Seventeen public health nurses have already left the state for war duties. Although this is a small number, it represents approximately 4 per cent of the total number of active public health nurses in the state.

Minnesota nurses have responded exceptionally well in the development of war nursing activities in practically every county in the state.

In Red Cross Home Nursing. Seven hundred eighty-eight nurses have attended institutes at which they received assistance in their teaching of Red Cross Home Nursing classes. One thousand fifteen have been authorized to teach, although only 925 certificates have been issued to women completing the course, before the end of this month, this number will be tremendously increased. The Minnesota quota for Red Cross Home Nursing certificates is 25,780.

In Red Cross First Aid. In many localities nurses have taken First Aid and Instructors' courses, and are assisting local physicians in this program.

The R. C. Volunteer Nurse Aide service in Minneapolis, and I believe in St. Paul and Duluth, are very popular. Before July 1 there will be 350 women in these three cities who will have completed their eighty hours of instruction and will volunteer their services in local city hospitals.

The hospital assistant program under the Office of Civilian Defense trains women to do many tasks which nurses have been doing, but which do not require professional education, i.e., receptionists, messengers, typists, and assistants in the care of the wards and rooms.

The National Youth Administration and the Works Progress Administration are also giving instruction to girls and women, so there are a number of plans for supplementing nursing service. However, there is a saturation point beyond which, for the safety of the patient, these nonprofessional workers cannot go.

An activity which is now in progress, is the following up of the National Inventory of Nurses made in 1941. We anticipate improved planning in the distribution of nursing service when we have a more accurate picture of the nurse supply in various counties. A Guide has been prepared by the National Nursing Council, and is available to communities. It will assist them in making plans for the distribution of nursing service.

The Minnesota Nursing Council for War Service, in its advisory capacity, has serious duties ahead. The success of the entire effort will depend upon the participation of all local communities in the war nursing activities. With foresight, planning and wisdom, we can deliver the necessary services and personnel.

The job must be done!

MISS LOUISE NEWCOMBE, president of the Minnesota State Board of Nursing Examiners: When war was declared, the nursing profession was no more ready for it than was the rest of the nation. Actually we had been hearing for sometime about a shortage of nurses for civilian needs, and occasionally it was said the shortage was due to the State Board of Nurses' Examiners hav-

ing closed so many schools. This most emphatically was not true. Some of the real reasons for the nurse shortage are as follows (and all of this applies not only to Minnesota but to the nation):

During the depression years of 1929-36-37, unemployment amongst graduate nurses caused most hospitals to add many graduate general duty nurses to their staff and correspondingly reduce their student enrollment, so fewer nurses were graduated each year and because graduate nurses could be had for so little, many smaller hospitals closed their schools as it was cheaper to have an all graduate staff than to run a good school.

However, in a few years the economic pendulum swung again, work became more plentiful and a nurse shortage was spoken of.

Changes had been taking place throughout the country which used up the increased supply of nurses.

1. The new and attractive field of stewardess on airlines and passenger trains had taken up a good many nurses. These have been given up now for the duration I understand.

2. Marriages increased with improved economic conditions.

3. Passing of the Social Security Act in 1935 made possible a vast expansion in all forms of Public Health work and public health nurses increased by about 2,000.

4. Industrial nurses increased by about 1,000.

5. Hospitals were affected, too, in various ways.

- (a) Hospital service plans had greatly increased the extent to which the public used hospitals.

- (b) Having become accustomed to a large graduate staff, hospitals found it difficult to dispense with them.

- (c) In line with other branches of industry, hospitals had put in the 8 hour day and 48 hours week and this called for a good many more nurses.

- (d) The increase in specialization, and new and scientific treatments had increased the amount of nursing service rendered to patients.

- (e) Because some of the public has become so "claim conscious" hospitals have found it necessary to keep more extensive records.

The above and other similar duties have become quite time-consuming.

6. Then, too, wherever Defense Industries and war projects have sprung up they have added hitherto unknown problems and hazards.

This was our situation when we went into the war. Our men have now been sent to the four corners of the globe and, of course, our doctors and nurses follow our fighting forces.

Last year (1941) Minnesota nursing schools graduated 829 nurses and this year they expect to graduate 1,300. Minnesota has 29 accredited nursing schools and 3,021 students in those schools as at present. In the U. S. as a whole there are 1,300 accredited nursing schools with 900,000 students in those schools, the only state having no nursing school being Nevada.

Even that 900,000 is not enough. It must be increased to 100,000 this year and 110,000 in 1943. There is urgent need for more nurses and not just more nurses to release graduate nurses for military duty. When the war is over, American nurses in almost countless numbers will be needed to help with the tremendous job of reconstruction. Our National Government has urged that standards be not lowered during this emergency, either in type of students recruited or in content of course offered.

Hospitals are going to face many difficulties of supervision as their skilled workers leave for active service and their places are taken by younger less experienced workers.

The National Nursing Council for War Service suggests that hospitals do the following:

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

1. Offer Refresher Courses to older inactive nurses so they may replace those who have left.
2. Economize nursing time by simplifying nursing procedures.
3. Allocate nonnursing duties to nonprofessional workers. We may have to change our ideas as to what duties must be done by nurses and what nonprofessionals can be taught and allowed to do safely.
4. Hold their essential administrative and teaching staff by maintaining good service conditions for all employees as to reasonable workers' hours, salaries and wages, food and housing, etc.
5. Urge all nursing personnel to make it their own responsibility as a national defense measure to do everything possible to safeguard their own health and so avoid lost nursing time.
6. Last and most important—put on a far-reaching recruitment program for well qualified students. The greatest difficulty at present is the competition at high wages from defense industries and business firms for young women in this age group. To offset this, radio talks are being planned and speakers from the nursing groups are going to ask women's clubs and organizations, High Schools and Colleges to be allowed to present the urgent need for more nurses. The National Government has given nursing a high priority rating.

It has also been suggested that the medical profession can render valuable help at this time by

1. Using private duty nurses on the basis of need rather than ability to pay, in other words "rationed" like sugar and tires.
2. Advocating group nursing in hospitals and hourly nursing in homes.
3. Using housekeeping aides in homes, where possible.
4. Economizing in the use of nursing time by careful scheduling of operations and reducing research work calling for nurses' time to that necessary for defense work.
5. Lastly, by trying to interest the right type of young women to take up nursing.

Our Board, as a board and individually through its members, is doing all it can to help in every way, trying to carry out the law with as liberal interpretation as possible and with understanding of present difficulties. Ours is the only accrediting agency for nurses, there is no other. We have moved our Fall examination usually held in November, forward to August in order to accelerate the registration of nurses—561 of whom are ready to write at that time. We may, for the first time, hold a third examination this year—in December.

It may be that some of our hospital schools now closed may wish to re-open and several such schools, if near together, might consider pooling their teaching resources and clinical services.

Our Board is always glad to give advice and assistance to any schools now in operation, or to any who may wish to re-open. As we have no Educational Director at present and the law does not provide remuneration or traveling expenses to Board Members for this work, any hospitals wishing our help would have to pay our traveling expenses and we would be glad to give our own time to this work.

In conclusion—there was never a time when all the allied professional groups—doctors, hospitals, nurses and Board of Examiners needed so much to work closely together. We believe we can rely on your co-operation in all the days that lie ahead and we do assure you of ours.

DR. F. J. SAVAGE, chairman of the Committee on Interprofessional Relations: No one could have listened to the reports of Miss Rolf and Miss Newcombe without being impressed with their scope and sincerity. Nothing needs to be added to Miss Newcombe's lucid

explanation of the shortage of nursing. I believe she did not mention the fact that whereas there were some sixty-four accredited schools of nursing there are now only twenty-nine. Any school which has been closed and wishes to re-open will get all possible assistance as Miss Newcombe said, if it wishes to re-open.

It should be noted that certification by the State Board is necessary to admit any nurse to service with the Red Cross or the Armed Forces. Any hospital which feels it has a grievance against the Board for any reason, may, if it wishes, report the matter to me as chairman of the Interprofessional Relations Committee. A board has been established consisting of three nurses, three doctors and three hospital administrators to hear such grievances. It has not yet met but will function whenever there is a call for its services.

The Speaker thanked Miss Rolf and Miss Newcombe for their reports and then called for the report of the Reference Committee on Medical Economic reports, Dr. M. C. Piper of Rochester, chairman. The following reports were considered:

EDITING AND PUBLISHING COMMITTEE

It again becomes my privilege to submit a report on the publication of MINNESOTA MEDICINE for the calendar year of 1941.

It may be recalled that at the outset of the year we expressed some anxiety concerning the journal during that year. We are happy to state, however, that MINNESOTA MEDICINE has continued to make a good showing financially in 1941, although we had to contend with considerable difficulty in maintaining advertising revenue.

The average number of copies printed during the year and the number of illustrations published per issue happened to be just the same as for the year 1940, the peak year in volume of printing for the journal. The net cash surplus for 1941 amounted to \$1,318.67, which was remitted to the office of the State Medical Association. This remittance represents a substantial sum to the credit of MINNESOTA MEDICINE.

The total number of copies of the journal printed during 1941 was 40,000, an average of 3,333 copies for each of the twelve monthly issues. The total number of pages printed amounted to 1,264, including two 4-page inserts as a center spread in the April and September numbers respectively, on the account of the Center for Continuation Study at the University. Of the total number of pages printed, 936 were devoted to reading material and 328 to advertising. The reading pages include 125 scientific articles, an average of 10½ such papers per issue; 22 case reports, 9 of these 22 reports appearing under the heading "Clinical-Pathological Conference," and 2 abstracts of papers published as part of the Proceedings of the Minnesota Academy of Medicine. There were 191 illustrations published, or an average of approximately 16 illustrations for each issue.

The special section devoted to Medical History filled a total of 79 pages, or an average of 6½ pages per issue; that for Medical Economics, including the special page on Industrial Health, filled 70 pages or approximately 6 pages for each issue. The page on Industrial Health was introduced in the August number, and is being published under the supervision of the State Committee on Industrial Health. Another new section added in 1941 is that of the Clinical-Pathological Conference, which made its initial appearance in the issue for April, 1941. Here appear discussions of interesting cases by members of the Minneapolis General Hospital Staff under the direction of Dr. Frank Andrus.

Other special sections include Editorial, Reports and Announcements of Societies, News Items, Book Reviews, the Yearly Roster of Members, and Minutes of the Annual Meeting of the State Medical Association. The section on news items continues to occupy a large portion of the journal due to the extra effort which is being made to gather material of this kind through all possible sources.

Subscription records for 1941 show a total number of paid member subscriptions of 2,614, with about 57 subscriptions carried the first part of the year as delinquent; paid non-member subscriptions amounted to 168, with 52 delinquent. The total number of subscriptions is 2,891, plus miscellaneous copies to advertisers, advertising agencies, complimentary, exchange and single copy sales of 411. Surplus copies on hand for filling orders for back copies, sample copies to prospective subscribers and advertisers, average about 100 monthly.

As a concession to conditions and at the request of the Co-operative Medical Advertising Bureau, an affiliate of the American Medical Association, the Editing and Publishing Committee approved of placing some of the advertising in the back of the book opposite reading material. This is now the policy of practically all state medical journals, as well as privately owned journals. No advertising is ever placed opposite any of the scientific papers.

The country is now at war, and it is of course impossible to even estimate what the effect of the war will be upon business. Conditions are bad and they are definitely growing worse as time goes on. More and more restrictions are being placed upon business concerns, and this is having its effect upon advertising volume. How severe these conditions will become before they become better only time can tell.

It is encouraging, though, that advertising volume so far for

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

the first five issues of the year compares favorably with the corresponding period for 1941. There are indications that medical manufacturers will not be as seriously affected as other industries. We are hoping that in the curtailment of advertising in the large consumer mediums, there is the possibility, although remote, of an increase in such class publications as medical journals. It is realized that this may be wishful thinking, but there is no definite evidence at this time of any loss in advertising volume. This, however, should be regarded only as a statement of conditions which have prevailed during the first five months of the year. They may be entirely different during the other seven months.

E. M. HAMMES, M.D., *Chairman.*

INDUSTRIAL AND CONTRACT PRACTICE COMMITTEE

No ethical infractions in connection with industrial or contract practice have been reported to the committee this year. In one or two instances contract arrangements are being closely watched, but there is nothing of a definite nature to report concerning them at this time.

F. A. OLSON, M.D., *Chairman.*

MEDICAL ADVISORY COMMITTEE

No unusual problems requiring a meeting of the entire committee have arisen during the past year.

The chairman has continued to receive reports of malpractice cases, threatened or actually started, and has studied them all carefully. In numerous instances he has given advice to the Insurer regarding special aspects of individual cases. At the request of the Insurer, also, he has reviewed material submitted and given an opinion as to the best manner of handling the case.

The number of cases submitted to the committee has shown a slight decline during the last year. There may have been other cases, of course, which have not been referred to the committee but the fact that our rate appears to be declining in comparison with last year may be safely taken to indicate that the general rate of malpractice suits is going down. This we regard as a healthy indication.

W. H. HENGSTLER, M.D., *Chairman.*

COMMITTEE ON MEDICAL ECONOMICS

The Committee on Medical Economics functions mainly through its extensive organization of sub-committees. Its work has been reported in detail through the respective chairmen of these committees and will not be repeated here.

In general it should be pointed out, however, that the war has substantially and inevitably altered the social and economic aspects of medical practice. The immediate problems of this committee, as of all other committees of the association, have been concerned during the past year, first, with the provision of medical services to the armed forces and, second, with the essential adjustments which must be made to meet the wartime medical needs of the civilian population.

Interest in new plans for the distribution of medical services, such as medical insurance plans and the extension of hospital insurance plans, continues to be active in many quarters within and without the medical profession, however, and the danger still exists that wartime exigencies may be used to promote hasty and ill-advised measures which, in the long run, will unnecessarily endanger scientific progress.

For that reason, in spite of emergency needs of the moment, physicians must examine every proposal carefully in the light, not only of the immediate need, but of the long-range effect upon medicine and the public welfare.

The section devoted to Medical Economics which appears each month in MINNESOTA MEDICINE is under direct supervision of the chairman and members of the executive sub-committee. Its aim has been to keep members informed specifically upon immediate war problems of medicine and upon progress elsewhere with medical insurance and other experiments in distribution of services, upon trends in legislative action in Washington and upon association policies as reflected in meetings of the Council Delegates and committees of the association.

Suggestions and contributions of officers and members will be welcomed by editors and members of this committee.

GEORGE EARL, M.D., *Chairman.*

SUB-COMMITTEE ON MEDICAL ETHICS OF THE COMMITTEE ON MEDICAL ECONOMICS

The Sub-Committee on Medical Ethics of the Committee on Medical Economics of the State Association has not had any question brought before it concerning the ethics of any individual medical practitioner in the State of Minnesota and therefore there is no formal committee report.

ROBERT D. MUSSEY, M.D., *Chairman.*

COMMITTEE ON LOW INCOME AND INDIGENT PROBLEMS

Several conferences have been held during the past year with officials of the Farm Security Administration. As a result of repeated requests by FSA authorities, the Farm Security plan for prepaid medical service is now being tried experimentally, with Council approval, in Ottertail and Morrison counties. The experiment began only a few months ago and while, so far, it seems to be working out fairly well, not enough time has elapsed as yet to evaluate the results.

Application by FSA officials to introduce the plan in Carlton county, also, was considered carefully and rejected by Carlton county doctors.

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

Permission has been granted by the committee and the Council for similar experiments in a few more counties. So far, however, no action on the matter appears to have been taken other than by physicians in the counties concerned or by the F.S.A. The whole question narrows down, therefore, to success or failure in Ottertail and Morrison counties. At least a year would elapse before any conclusions in the matter are attempted.

W. A. COVENTRY, M.D., *Chairman.*

COMMITTEE ON SICKNESS INSURANCE

The Committee on Sickness Insurance begs to report the activities of the Committee during the past year.

Representatives of the Minnesota State Medical Association attended the Conference on Medical Service Plans, which was held in Chicago, Illinois, on February 14, 1942, and herewith submit a summary of the discussions that were had at that meeting.

Conference on Medical Service Plans February 14, 1942, Chicago, Illinois

There are four types of medical service plans:

1. Cash indemnification. There are two types under this group; (a) insurance company plan; (b) employer-employee groups. Less than 6% population in U. S. A. have sick accident insurance.
2. Group clinic or consumer clinic type; 30 such plans in the U. S.—150,000 persons covered. Example: Ross-Loos Plan, Los Angeles—Group Health Association.
3. Voluntary prepaid medical service plans. These plans are sponsored by medical societies; 25 such plans in U. S., 750,000 persons covered.

Reason for conference: to coördinate these plans.

4. Compulsory medical service. Least desirable of all plans. Medical service is a personal relation and should be maintained as such; the welfare of the patient is the primary consideration. The financial aspect should be subordinate. Contract practice restricts choice of physician. Study has been made of 335 plans. A voluntary plan need not lead to a compulsory plan.

At the meeting various types of medical service plans were discussed. (Details of the plans are deleted for brevity's sake.—EDITOR.)

There is no likelihood of a uniform plan throughout the United States. Material on various plans was assembled for a meeting of the American Medical Association held in Atlantic City in June. A committee was appointed to meet with the Board of Trustees of the AMA to consider permanent organization of prepaid medical service plans. Motion was passed to also appoint a committee to meet with a like committee from the Hospital Service plans.

Following the Conference in Chicago, the Committee on Sickness Insurance met and decided to make surveys along three lines of investigation as follows:

1. A sub-committee, composed of Dr. O. I. Sohlberg, St. Paul, chairman, Dr. F. R. Hirschfeld, Minneapolis, Dr. O. W. Holcomb, St. Paul, was asked to consider prepayment service plans that might be workable for urban groups.
2. A sub-committee, composed of Dr. W. W. Will, Bertha, chairman, Dr. J. L. Mills, Winnebago, Dr. E. W. Johnson, Bemidji, was asked to investigate plans that might be workable for rural groups.
3. Further, it is the consensus of opinion that if any sort of a state-wide prepayment medical service plan or plans were to be instituted, it would be necessary to prepare an Enabling Act which would be submitted to our legislature and a sub-committee of the following was appointed to carry on this investigation: Dr. C. A. McKinlay, Minneapolis, chairman, Dr. V. P. Hauser, St. Paul, and Dr. R. R. Cranmer, Minneapolis.

As these subcommittees continued to carry on their work, a meeting of members from various states where prepayment plans have been instituted was held in Atlantic City on June 10, 1942, at the American Medical Association Meeting, at which time reports were made concerning the difficulties and the success and failure that had been met with in their respective plans. (The report of various plans in detail is omitted for brevity's sake.—EDITOR.)

In general it can be stated that the physician is the most difficult one to sell and educate on the plan. Rates have generally been too low. No plan has been in operation long enough to have reliable statistical data. States must have special laws enacted unless operated as insurance company. All plans are under the jurisdiction of the insurance department of each state. The Committee strongly favors gathering of data by the Bureau of Medical Economics of the AMA and meeting once each year in Chicago either in November at the Secretary's meeting or in February at the Medical Conference.

The Committee on Sickness Insurance then met to review the activities of the various subcommittees.

Dr. Sohlberg submitted a report which is as follows:

This is the report of your sub-committee on urban plans for prepayment medical care. There does not exist enough experience to warrant a full report from an actuarial point of view.

The best experience is in Toronto, Canada, where a highly successful plan is working. This plan is successful because of the hard work and the genius of Dr. Jason Hannah. He is firmly of the opinion that any plan not sponsored and controlled by the medical profession will ultimately be run with money as a criterion and not service.

The Toronto plan takes in hospital care, nursing, medicine and medical care. It began in 1937 and has grown from 750 to over 30,000 subscribers. People must buy it; it is not so-

lited. The cost is \$2.50 per month with additional charges for dependents. It is watched closely by Dr. Hannah. He states that about 88 per cent of the medical profession are very much for the plan, about 7 per cent accept it and about 5 per cent oppose it. It has paid well. They have bought a complete filing system and have accumulated a surplus of over \$50,000.00. This plan deserves further study and could well be used as a model.

There is a very good plan functioning well in Wichita, Kansas. This, however, is a postpayment plan sponsored by the local medical society and financed by the Community Chest. Such a plan deserves further study and may be as good a solution as the prepayment plan. At least it is working satisfactorily there.

The medical society asked the Community Chest to pay for the social investigations and they agreed to do so. People needing medical care and who express concern over the cost are referred to the Social Service, who investigate and report. They may suggest full payment, part payment (and what part) or free service, or they may suggest deferred payment. The medical profession as a whole endorses it, work with it and is satisfied. The public is well pleased. This plan is little publicized. Possibly this is the best plan for a city unless a full time medically trained executive is prepared to take over as Dr. Hannah has in Toronto.

Other plans are surgical only (Michigan) or limited in some other way.

In the Twin Cities we are looking with benevolent neutrality at a plan proposed by a Credit Union of the employees of Ramsey County, "Group Health Mutual, Inc." It is very limited as yet but they show the proper spirit of service and it allows a free choice of physician. It costs 90 cents a month. It, however, is an experiment and should be interesting to watch.

These are in our opinion the three best examples for us to watch and follow if we see fit.

OLOF I. SOHLBERG, M.D., *Chairman.*

Dr. Will reports that his subcommittee had difficulty in preparing a report in view of the fact that rural communities have not as yet developed successful plans for conducting a prepayment medical service plan and therefore has no specific suggestions to make at this time.

Dr. McKinlay's subcommittee which was to investigate the Enabling Acts found that they did not have adequate reports on Enabling Acts and therefore postponed making any recommendation until the report from the recent meeting in Atlantic City was submitted. He further reports that the program is too large to arrive at a hasty decision but his subcommittee is willing to continue its efforts in conducting a survey in collecting the material for subsequent meetings.

At the conclusion of this meeting the following resolution was suggested:

The Committee as a whole with the aid of our attorney, the executive secretary and secretary, have made many investigations and in view of the fact that there has been a great deal of study of prepayment and postpayment medical service plans, and inasmuch as the medical service plans in operation are still in their experimental state, your Committee on Sickness Insurance believes that we are not prepared to make definite suggestions concerning the development of a state-wide prepayment or postpayment medical service plan at this time.

The Committee is most willing to supply the data accumulated and to advise those local groups within the state who might be interested in experimenting with and developing prepayment or postpayment medical service plans.

The Committee recommends further study along these lines and to that end recommends:

1. That copies be obtained of all the Enabling Acts enacted in the various states.
2. Copies be obtained of the contracts now used in those medical service plans which are in operation.
3. That definite information be obtained as to the service charges to the contract holders.
4. That information be obtained with respect to the professional fees paid for the various services under such contracts.
5. That all information in the way of suggestions and criticism of the various plans now in operation be obtained from time to time.

The Committee further recommends that the Minnesota State Medical Association send representatives to and participate in the Annual Conference of Medical Service Plan Representatives.

A. W. ADSON, M.D., *Chairman*

DR. M. C. PIPER, Rochester, Chairman of Reference Committee on Medical Economics reports:

Editing and Publishing Committee.—This is a very enlightening report and both the committee and the publishers should be complimented on the successful year. The reference committee feels that it has maintained its standard of excellence.

The item of future revenue and cost was carefully discussed with reference to the possible decrease of revenue from advertising and increased cost of publishing. It was felt that possibly the earnings of the past year might be kept as a definite reserve fund to meet possible future deficits.

It is assumed that the Editing and Publishing Com-

mittee has a definite plan of curtailing expenses, if necessary, due to a reduction in advertising revenue.

The reference committee recommends the adoption of this report.

Industrial and Contract Practice Committee.—The reference committee recommends adoption of the report of the Industrial and Contract Practice Committee, and feels that this is an essential, and its activities should be continued.

Medical Advisory Committee.—The reference committee feels that this report should be adopted, but with the general recommendation that more specific data as to the reduction in malpractice suits as compared with previous years and their method of solution might have been more enlightening to the House of Delegates.

Committee on Medical Economics.—The reference committee recommends adoption of this report.

Subcommittee on Medical Ethics of the Committee on Medical Economics.—The reference committee recommends adoption of this report, but feels possibly that the House of Delegates would like to be enlightened as to the specific functions of the Medical Ethics Sub-Committee of Medical Economics.

Committee on Low Income and Indigent Problems.—The reference committee recommends the adoption of this report.

Committee on Sickness Insurance.—The reference committee recommends adoption of this report on sickness insurance, and wishes to compliment the committee on their activities and the excellence of the report which they have submitted, and recommends to the House of Delegates the adoption of the five proposals made in the committee report. The reference committee would like to suggest that a copy of this report be placed in the hands of the secretary of all component societies, to be read by such component societies and to be kept as a record of reference.

DR. GEORGE EARL, Saint Paul, chairman of the committee on Medical Economics: The work of the Medical Economics committee is done by its various subdivisions and their excellent chairmen whom you will undoubtedly hear later. Responsibility for one phase of the work lies with the chairman and the editorial subcommittee. That is the section on Medical Economics in MINNESOTA MEDICINE. Here we try to give information on economics and the war, on legislation in Washington, sickness insurance, medical care for low income and indigent groups and other related subjects. I want to thank Mr. Rosell, who checks over this material, and Mrs. Fitzgerald, who edits the material, for their assistance in this work.

DR. A. W. ADSON, Rochester, chairman of the Committee on Sickness Insurance: The problem of prepayment and postpayment plans for handling costs of medical service are among the most vital before the medical profession today. You will see in the report of the committee that there has been a great deal of experimental activity all over the country and two conferences in Chicago and in Atlantic City which Mr. Brist and I attended. You will find Mr. Brist's notes on experiences reported elsewhere at these meetings in the report. You will note, also, the findings of our subcommittees on urban and rural plans from Dr. Sohlberg and Dr. Will and on enabling acts from Dr. McKinlay, in the report. Also the recommendations from the committee which, in view of the confused and inconclusive state at this time, suggest further study. You will be interested perhaps in the proposals which Group Health, a cooperative organization of credit unions with offices in St. Paul pre-

sented to the committee. The first plan of this organization was not approved because it did not provide free choice of physician. But it is understood that a policy is being developed which corrects that fault.

As a whole we have come to the conclusion that the demand for sickness insurance comes chiefly from people who have failed to realize the difficulties involved. Also though we are willing to supply data to local groups within the state who may be interested in experimenting with prepaid plans, we are convinced that organization of a state-wide plan is a tremendous undertaking. We do not feel that we are in a position yet to state whether it might be a good thing or not, but we are attempting to learn everything possible from those who are trying it elsewhere.

DR. GEORGE EARL, chairman of the Committee on Medical Economics: Even in Michigan where they started with complete medical service, they have largely restricted their service to surgical benefits only. They were bankrupting themselves under the original plan. Obviously we are not ready yet, on the basis of experience elsewhere, to recommend a state-wide plan here; but we must make it clear to our members that our delay in taking action in Minnesota is not due to neglect nor failure of this committee to function.

DR. ADSON: It appears from Michigan's experience that limited surgical and obstetrical service may be more practical than complete service. It might be noted, also, that one of the chief problems that confronts all such undertakings as this is the problem of selling. The people don't just come and ask for the service and neither do the doctors accept it wholeheartedly. A great deal of missionary work is required to make it a going concern. There is also the problem of finding an administrator, preferably a doctor, who will be willing to give up his practice to develop the organization. In dealing with this entire matter the committee has been very careful, furthermore, not to say or do anything that might lay the medical profession in Minnesota open to charges of monopoly or of attempting to obstruct the development of the movement toward new plans for covering cost of medical service.

It was brought out in discussion between Dr. Adson, Dr. Earl and Mr. Rosell that the Michigan State Medical Society had appropriated a total of \$50,000 to set the Michigan plan in motion and that there is now a deficit of \$60,000, after two years operation, and that the Massachusetts State Medical Society has already appropriated \$20,000 to the development of a plan which is not yet in operation.

At Dr. Adson's request, the Speaker then called on Dr. Gunderson of Wisconsin:

DR. GUNDERSON: Among many objections to sickness insurance as so far developed is the fact that, like all other insurance, it must be on an actuarial basis and must be controlled by experts who know insurance. In Michigan that meant that the plan must be controlled by laymen since no physician was available who was an expert in the insurance field. That is a very serious objection. Furthermore, sickness insurance has to be put at a very low premium to make it attractive enough to sell, too low to pay for proper medical service. The best service cannot be given for the premium charged and so you foster two standards of medicine, one for subscribers to insurance, and one for private noninsurance patients, a very dangerous condition in medicine. If your committee can suggest solutions to these two problems it will deserve great credit.

In response to questions from the floor about the California plan, Dr. Adson said that there is a state-

wide plan there and that it is encountering much the same difficulties as Michigan.

DR. EARL: A group of men who are running both the San Francisco and the California plans talked to me at Atlantic City about their troubles. They had difficulties, for instance, where a group of three doctors were practicing in the same building and were obliged to parcel off patients between them, the internist having one patient for a while, then the eye, ear, nose and throat man, then the surgeon.

DR. SEIFERT: There is disagreement as to fees and as to what bills should be honored and what not honored. Also they have not been able to pay anywhere near the fees stipulated, but have had to settle for a percentage and sometimes a small percentage.

The Speaker then asked for the report from the State Board of Medical Examiners by Dr. J. F. Du Bois, secretary, which was confidential and therefore not recorded.

A Resolutions Committee composed of Dr. R. W. Morse of Minneapolis, Dr. M. J. McMahon of Green Isle and Dr. Clarence Jacobson of Chisholm was then appointed by the Speaker and delegates were asked to submit resolutions to this committee. The House adjourned until 7:30 p. m.

Sunday Evening Session

The Speaker called upon Dr. T. H. Sweetser of Minneapolis to discuss the report of the Committee on State Health Relations adopted at the afternoon session.

DR. SWEETSER: Members of the Committee on State Health Relations will be on hand in the booth reserved for us in the exhibit to discuss the matter of the proposed reform in our coroner system. I hope all of you will come to see us and inform yourselves of the proposal which, as you now know, calls for setting up a State Medical Examiner's office with a travelling pathologist and toxicologist for the state so that legislators can be informed in advance when we go to them with the plan next winter. We found that it will not be possible or advisable to attempt to upset the county coroner system now in existence, but we are sure that the plan outlined will afford a great improvement over the present situation. We may have difficulty now securing qualified men for the office, but we hope to have the setup ready so that we won't have to go back to the present unsatisfactory condition when the war is over. Information will be published on the matter from time to time in MINNESOTA MEDICINE. We hope you will watch for it and discuss it with your legislators.

The Speaker then called upon R. R. Rosell, executive secretary, to discuss the report of the Committee on Low Income and Indigent problems in the absence of Dr. W. A. Coventry of Duluth, chairman of the committee, at another meeting.

MR. ROSELL: The Farm Security group of the Social Security Division came into the state two years ago and secured permission of the Council to experiment with their plan for prepaid medical service to Farm Security clients in two counties, Ottertail and Morrison. After six months' operation in these counties they asked also for permission to go into Carlton and Beltrami counties for similar experiments. The Council approved, pending approval of local physicians in the counties. But the local doctors felt that the plan was not needed and rejected the proposal. Later experiments in Aitkin and Mille Lacs county were approved and doctors there are studying the matter to see if extensions shall be made to those two counties. To date no action has been

taken. The plan will have been in operation one year on September 1 in Ottertail and Morrison counties, but no conclusive figures are available as yet as to the success of the work.

The Speaker then called on Dr. A. J. Chesley, secretary and executive officer of the Minnesota Department of Health. Dr. Chesley's address was of a confidential nature and was not recorded.

The Speaker next called upon Dr. W. F. Braasch of Rochester to report on the work of the National Physicians' Committee.

DR. BRAASCH: The National Physicians' Committee got off to a rather slow start for two reasons. First because difficulties of organization were great and, though we were really a stepchild of the American Medical Association, we were not given the official stamp of approval. Reasons for this failure are now largely overcome, and I am happy to say, since the last meeting of the House of Delegates at Atlantic City, we are now a legitimate offspring and have the green light to go ahead. The second is that we were originally organized through a central committee which actually operated to limit our progress somewhat. Now that is being corrected and we are organizing by states and large communities and are cementing a truly nationwide organization. It must be remembered that propaganda costs a tremendous amount of money and we cannot fight our battles without money. Thus we must not only ask for money once; we must ask for it continually. We have accomplished a great deal with the limited funds available so far but we need much more. You are all familiar with the pamphlets and advertisements that have already been distributed. They have had a surprisingly widespread effect on public opinion. This year we propose to provide 1200 newspapers throughout the country with weekly editorials, and we have embarked also on a program of radio broadcasts. Successful propaganda calls for constant repetition of facts by every possible medium. Beginning this fall our program will increase in volume and activity because it is more than ever necessary to acquaint the public with what medicine in America stands for. There is evidence on every hand that unless a determined stand is made now the independence of medicine in America will be a thing of the past and we shall be controlled by outside forces. The future of medicine, from a scientific as well as economic point of view, depends upon our efforts alone. Unless we hang together on this issue we shall certainly suffer separately. I hope you will bring this message to your members at home and help in every possible way to carry on this work.

DR. F. J. SAVAGE, Saint Paul, chairman of the Minnesota Division of the National Physicians' Committee: Our state-wide committee was the first completely organized committee within the National committee and we had the distinction, last year, of leading all other states in the Union in contributions. I would like to correct the number given by Dr. Braasch of newspapers receiving the NPC editorials. It is, I believe, 12,800, not 1200, and I am sure those editorials, thousands of which are used weekly, as clippings at headquarters show, are having a tremendous effect. Results may be a little bit intangible, but I have it on good authority that President Roosevelt's declaration supporting private practice and the right of the patient to choose his physician, made a few years ago at the dedication of a hospital in Maryland, was directly due to activity of the committee. Soon you will be receiving another letter from Dr. Braasch and myself about the needs of the committee and I hope you will respond as well as you did last year.

The Speaker then called upon Dr. H. Z. Giffin of Rochester, president of the Minnesota State Medical Association, to give his presidential address. (Dr. Gif-

fin's address was printed in the July issue of MINNESOTA MEDICINE.)

The Speaker now called upon Major C. A. Wood of the Medical Officers' Recruiting Board in Saint Paul.

MAJOR WOOD: Before December 7 and the outbreak of war, the Procurement and Assignment Service was set up at the request of the American Medical Association so that, in case war came, the handling of wartime medical service would be kept entirely in the hands of the physicians without government interference. The object was to avoid any wartime dangers of state medicine. The government concurred and the classification of physicians began with a view to determining community needs, and the men who could be spared to enter the armed forces. Committees were set up in each state and, in the meantime, questionnaires were sent to all from the national headquarters of the Procurement Service to provide a complete and up-to-date file on the professional personnel of the country. The majority of the physicians filled out and sent in their questionnaires in good faith. But then came December 7. We got into the war and the emergency became acute. Physicians were needed immediately but they did not respond in sufficient numbers. They have not responded up to the present time. Minnesota has done as well or better perhaps than the average in enlistments—there are, I believe, some 400 Minnesota men in the various branches of the armed forces—but that number is not enough.

The Medical Recruiting Board was set up to get more physicians and to get them quickly because two or three months are required to get a commission through the Surgeon General in Washington and time is short. The Recruiting Boards were directed to facilitate induction and cut that time to a minimum. The purpose is to get all who have been classified as available by the state Procurement Committee to come in to Saint Paul at once and apply for Commissions. We need approximately 400 more in Minnesota by the first of January. Here is our procedure. The first thing we do when a man comes in is to find out if he is available. We get that record from the Minnesota State Medical Association office next door. If he is available, application blanks are typed by the staff. That takes about half an hour and then the man is sent out to Fort Snelling for his physical which takes about three or four hours. Then he goes home and when we get his papers back from Fort Snelling (usually in three or four days) the man is notified. If he is physically qualified he comes in, is sworn in and given a month's deferment to close his business affairs. His papers are sent to the Surgeon General together with the date when he will be available and he is notified from Washington where he is to go and when. Notification from Washington sometimes is delayed a few days beyond the month set, but he is actually in the Army within a week after he applies for a commission.

The Recruiting Board commissions dentists only up to and including thirty-six years. We can give physicians to thirty-six commissions of first lieutenant and, from thirty-seven to forty-four, commissions of captain. For higher commissions applications must be made to the Surgeon General. All this is, of course, on a purely voluntary basis. But the draft may catch up with the man in A-1 who delays too long. Then he is liable to service as a buck private. From ages forty-five to fifty-four we can take applications and make examinations but applications must go to the Surgeon General for approval. Of course, the Army needs young men chiefly and only a small number of these can be majors or lieutenant colonels. A few men with special qualifications can attain those grades but many majors and colonels have already been called in from the reserve and the Army is not interested in many more in those grades.

We have sent out some letters to men who are classified available and so has the Procurement and Assign-

ment committee. As a result, since last May, we have had ninety-three applications from physicians of whom only thirty-three have been sworn in to date. Many came in with physical disabilities but were sent for examinations so that they could be turned down officially. One physician from New York was sworn in as private last week after his New York draft board ordered the Minnesota board to have him inducted. When the order came he tried to apply for a commission but it was too late. I mentioned that case in my letter and a lot of men resented it very much. But the fact is that the Army can get its medical men and surgeon for a private's pay of \$50.00 a month if it wishes—and if the physicians wait for the draft. For the present they are offering commissions but there is no regulation on that and the policy may be changed.

These are some of the reasons given by the young men who are still staying out. There has been a misunderstanding about Procurement and Assignment. Many thought it was a kind of draft and that they could sit tight until they were summoned by Procurement and Assignment. But the Procurement and Assignment Service has no authority to summon men. Some thought the letter sent should be more personal. Others appear to believe the war will be over in a few months. If anybody can cite any good news that has come out of the war since Pearl Harbor outside of Coral Sea and Midway I don't know what it is. Many others want a higher rank or they want to be assured that they will be able to do some special type of service such as ophthalmology. Many have criticized Procurement and Assignment. They say they have not been informed if they are available. There may be some justice in that. In any case, three or four times as many physicians volunteered in the first six months of the last war than have volunteered this time. Col. Hullsiek of the Selective Service has told me that the draft boards do not want to draft physicians into the ranks if they can help it. But the war must go on and physicians will have to be secured in some fashion. I, myself, was in private practice before I went on active duty and I am going to have to try to make a living again when this is over. But I want the privilege of going out and digging for it where and how I please without dictation from the government. The only way to avoid that, as I see it, is for all of us to help make this Procurement and Assignment plan work. It was started at the request of the American Medical Association, and it is up to us to see it through.

LIEUT. COMMANDER MILLER, U. S. Navy: The office for Officer Procurement for the Navy opened about a month ago at 706 Roanoke Building, Minneapolis. We are receiving applications there for junior and senior lieutenants and lieutenant-commanders from physicians up to fifty years of age, though we prefer men of the age group to qualify as junior and senior lieutenants. It takes about six weeks in Washington and one week here to get cleared for commissions in the Navy and we shall be glad to interview and give physical examinations to any who wish to come in. So far the Navy has been more fortunate than the Army and its needs have been supplied from those who come in. Applications for the Navy Air Corps are handled through the same channels. For the Air Corps, applications must be made for commission. After that a request is made to be sent to Pensacola for flight training. Most flight surgeons will go on aviation recruiting service, however, and only a few will actually serve as flight surgeons with the aviation corps.

DR. W. F. BRAASCH, chairman of the State Committee on Procurement and Assignment: Our state committee on Procurement and Assignment, as you know, represents all sections of the state. Dr. Collins is representative from this section; Dr. Gosslee of Moorhead represents the Northwest; Dr. Thabes of Brainerd, the North Central; Dr. MacDonald represents Minneapolis;

Dr. Dougherty, Saint Paul; Dr. Hunt of Fairmont, the Southwest, and I represent the Southeast. In addition, we have committees in each county in the state. All of our decisions are strictly impersonal and impartial and they are not the decisions of any one man.

There seems to be confusion as to the duties of the Procurement and Assignment Committee. As Major Wood has told you, the committee cannot force a man into the service nor tell him he must apply. The committee may call attention to the need but it functions only to classify men as to their availability on the basis of community need. If a man is essential to his community or to industry or to education or war research, we classify him as unavailable. If he can be spared from his community and is not engaged in these special services then he is classified as available. It is apparent, as Major Wood has said, that a number of men have understood that they should await orders from the Procurement and Assignment Committee before applying. But the PAS cannot give orders. It can and does classify as to availability and its decision in that matter is accepted by the draft boards. We have nothing whatever to do with a man's rating with his draft board, nor with the commission which he may be given. PAS has been handicapped because the national PAS was slow to get into action. Delays were due to lack of funds and inability to get procurement issue blanks printed. The Recruiting Boards were set up because the need was urgent and the Surgeon General had to have immediate action. Major Wood has cooperated fully with our state committee and the State Office.

We were interested in the reaction to McNutt's speech at Atlantic City. If you have read it, you will agree, I'm sure, that the situation demanded something of the sort though the manner might have been more delicate. We do not hear quoted those other remarks in which he reiterated that, so far as he is concerned, there will be no attempt after the war is over to socialize medicine, that he will do everything in his power to maintain free enterprise in American medicine.

The point is that we must raise more than 400 men between now and January 1 and there has been a tendency for some reason or other and particularly in the larger communities, to hang back and wait for the younger fellow to go in. I believe that tendency will change now that misunderstandings will be removed by this session. Rest assured that this committee will do all in its power to see that no community suffers for lack of medical service.

Discussion from the floor revealed the fact that many were under the impression that Procurement and Assignment would notify them individually when their services were required and that, having indicated their willingness on PAS questionnaires to serve, they were required to do nothing further until they received such notice. It was revealed that they had been told officially in some instances by representatives of the national PAS that they "should sit tight" until they received such notification. It was explained, in the course of discussion, that the first letters sent out by the state committee were directed to men in the lower age groups who had been classified as available; that this letter should have been regarded as sufficient notice that the recipients were needed; that notices would be sent to older men up to 45 as they were needed; that the fact that not all men in the lower age group had received letters must be assumed to be because some were classified as not available because they were essential to hospital or teaching staffs or for other reasons could not be spared from their communities.

It was agreed that a general letter should go out to all members explaining the precise functions of the Procurement and Assignment Service and that only men in the lower age groups who are now classified as available and those in older ages who are unmarried would be especially asked to apply for commissions for the present. All men under 45 should hold themselves in readiness to apply, however, as they

are needed. It was also pointed out that when the quota for Minnesota is filled (approximately 400 more by January 1) no further applications would be urged by PAS.

Discussion also brought out the fact that any man who is classified as available may appeal to the state committee on Procurement and Assignment for a change in the classification if he believes a mistake has been made. Men who have been placed in A-1 in the draft may also appeal the decision of the draft board within ten days if they feel an injustice has been done.

Major Wood said that Minnesota is doing as well or better than the average in providing medical officers but that the Army needed 5,000 more physicians by the end of July and that Minnesota had produced, through his office, only 33, actually signed up and sworn in, and that he is certain the rest of the states had not produced enough to make up the remainder.

Dr. Braasch said that the action in Alaska has precipitated the need for more doctors quickly, that whereas they had aimed at 6.5 doctors for each thousand men previously they were now asking for 10 doctors per 1,000 and that quick action by the recruiting boards in cooperation with Procurement and Assignment was essential.

It was re-emphasized that draft boards are now accepting the classification as to availability made by PAS and that no physician classified in A-1 who applied for a commission would be inducted as a private for the present, but that he runs the risk, if he does not apply in time, of being drafted, provided he has not appealed on ground of undue hardship and been deferred by his appeal board. There is a physician on each appeal board and all such cases will be given consideration.

Dr. B. B. Souster of Saint Paul, secretary of the Minnesota State Medical Association, then read a newspaper account of the talk made by Manpower Director Paul V. McNutt at the Atlantic City meeting of the American Medical Association.

DR. BRAASCH: The newspaper accounts of McNutt's speech were not complete and did not emphasize his clear statement against state medicine which accompanied the call to doctors to go into the service.

DR. BUTE: I heard Mr. McNutt's speech in Atlantic City and I was aroused but not insulted by it. I fear some of us fail to realize that the Office of Procurement and Assignment was conceded to us by the Army officials in response to the request of representatives of the American Medical Association. Mr. McNutt's technique offended many physicians. Certainly no one would accuse him of courting our political favor. His remarks were intended to arouse members of the American medical profession to a full realization of the gravity and urgency of the problem which he presented. I am not sure that he was entirely successful in doing much more than aggravating many of his hearers. Certainly there has not been a sensational increase in requests for commissions.

The American physician needs the Office of Procurement and Assignment. I hate to think of what his fate might be if the Manpower Board should take over the job of recruiting the medical corps. Mr. McNutt warned us to do the job "or else" and it was that "or else" which caused the irritation. If we will pause and analyze our position, I am sure that we will realize that discreet action is needed or we may be forced to accept an arrangement which may differ little from the civilian selective service.

There is some justification for the attitude of those who have criticized the Office of Procurement and Assignment but any failure should not be attributed to the State Committee or to Major Wood of the Medical Recruitment Board. This committee is not to blame for the present confusion and obviously Major Wood

has dealt with his problem with efficiency and commendable tolerance.

Confusion should be expected. It could scarcely be otherwise while we are attempting to increase an army from thousands to millions within a period of a few months. Lt. Col. Seeley, executive officer for the National Office of Procurement and Assignment, admitted that the early methods were productive of misunderstanding long before the State Committee was created. I believe the state offices of Procurement and Assignment were established in order to iron out difficulties which arose as a result of plans promulgated by the Washington office. You will recall that early we were advised to "sit tight" and to wait. Recently this position was reversed and now the utmost speed is desired. If physicians appear apathetic it is because they have been following instructions; but these instructions did not emanate from the State Office and the members of that committee should not be blamed. Nevertheless, the problem is now an urgent one and the responsibility for its achievement rests squarely on the shoulders of that body of men. They have an immediate and pressing task and they are trying to accomplish it. The physician is not to blame because he appears to be delinquent. As a matter of fact, it is probable that there has been no delinquency on his part in the majority of cases. Right now, however, it is clear that we will improve our position by a discontinuance of these considerations. Instead, we should make an earnest effort to carry out the scheme which is now proposed by Dr. Braasch and his committee and by Major Wood. We need their protective influence. We should consider them our own local committee and through it we can accomplish much more than through an office in Washington or by some form of drafting. If we will do this, I prophesy that there will be a gratifying response to the letter which Dr. Braasch has promised.

Lt. Commander Miller said that the Navy is not sending out any letters, that it is relying solely on men who come into the office voluntarily and that men who do so apply, pass the physical examination and secure recommendation there for commission, will be cleared with their draft boards even though there is a delay of some six weeks in getting their commissions from Washington.

The Speaker then called upon Dr. A. W. Adson of Rochester to give the report of the delegates to the American Medical Association.

Dr. ADSON: The meeting was called to order on Monday, June 8, 1942. A very large proportion of the delegates, in fact larger than any other initial meeting (164 out of a total of 175) were present. The usual reports such as the annual address of the Speaker of the House, the President, and the President-elect were presented and should be read in the *American Medical Association Journal*.

The report of the Secretary, Dr. Olin West, shows the gradual increase in the number of physicians belonging to the American Medical Association. In the last year there has been an increase from 118,441 to 120,701. In the state of Minnesota, the membership has shown a very substantial increase.

The discussion of what to do with doctors who enlist in the Army, so far as the Medical Association dues are concerned, is not a concern of the American Medical Association. There are no dues to the American Medical Association. A doctor pays eight dollars for the *Journal of the American Medical Association*.

There are nine trustees appointed or elected at staggered intervals by the House of Delegates. These are chosen from points throughout the United States, usually because of their activities in things concerned with the American Medical Association. They are elected for two terms of five years each and really constitute the Board of Directors of the American Medical Association. Financially, the gross income for

1941 was \$1,939,127.39; the net income was \$223,347.64. Of this, \$77,424 represents interest on investments. There are employed by the AMA some 644 persons, so one can readily see that this is a large organization.

Another topic was the *Journal of the American Medical Association*. Minnesota averages very high in number of physicians in the state who subscribe to the *AMA Journal*, the average of this state being 57 per cent. This is a fine journal and more physicians should subscribe. Some of the special journals which the Association prints show a profit and some a loss—but they are continuing as before and reducing the size of two of them. During the year a new magazine has appeared on the list called *War Medicine*, which deals with all phases of war and its treatment as far as medicine is concerned, and it should be very much in demand during this period of stress. It has made a very fine and satisfactory increase in its circulation, and the Association feels proud of this magazine.

As you know, there are many subdivisions of the Association and one of them is the Council on Pharmacy and Chemistry which works in conjunction with governmental agencies in the standardization of drugs. Many new drugs have come out during the past year, probably more than usual, and much of the time of this Board has been spent on their proper nomenclature, and as to whether or not they shall meet with the approval of the American Medical Association. Their various publications are available through the *Journal of the AMA*.

The Council on Physical Therapy is continually getting out reports on different physical ailments and classifying physical therapy procedures and machines. Those that are approved at least have merit.

The Council on Foods and Nutrition has been chiefly concerned with the question of fortifying foods with vitamins and certain minerals and still keeping within certain bounds. They have approved, however, supplementing with B₁ along lines suggested by the National Research Council governing the Food and Drug Administration. They are in favor of adding vitamin E to oleomargarine to raise the standard of this product to the level set by the Food and Drug Administration. The question of mixed vitamin therapy was discussed and more or less rejected.

The Council on Industrial Health is a very active group and does a lot of work. They are stressing the question of physical examinations in industry now and care of occupational diseases. They are making progress, and this is a fertile field at this time.

In 1941, 2,806 package libraries were distributed by request to every state in the Union, to the District of Columbia, Canal Zone, Hawaii and Mexico; 12,833 periodicals were loaned in the same period; 6,650 reference questions were answered; 7,279 copies of the directory of the American Medical Association were sold.

The Council on Research has studied artificial respiration, specifications for Ultra-Violet lamps used for disinfecting have been formulated, methods for estimating loss of hearing have been studied.

In 1941, the Bureau of Health Education answered 10,000 letters from laymen, over 300,000 pamphlets were sent out, 88,000 health posters were sent to industrial plants. They have cooperated with the editor of *Hygeia* and for six years this bureau has been on the air. The director and assistant director have appeared before 148 audiences in 16 states. This involved 43,000 miles of travel. They have cooperated with various lay organizations, 4-H clubs, National Congress of Parents and Teachers, American Public Health Association, National Health Council, National organization for Public Health Nursing, county and state medical societies and governmental agencies.

Approximately 10,000 inquiries were submitted to the Bureau of Investigation. They came from physicians, laymen, governmental agencies, business concerns, commercial organizations, newspapers, radio stations and

high school and college students. The subjects most frequently asked about were so-called cancer cures epilepsy, diabetes, coal tar drugs, cathartics and the treatment of colds.

The Bureau of Legal Medicine and Legislation always has many problems on its desk. A good deal of importance this year has been attached to the taxation of Accounts Receivable of a person whose practice has ceased. They are working hard on this problem and will probably straighten it out in a short time.

During this war period there is much concern with the question of priorities in war procedures. If anyone has any definite problems with respect to this question he can write to the AMA and have them straightened out there for him.

It might be stated here, as you have probably noticed in the papers, that the Court of Appeals in Washington has decided adversely to the American Medical Association. It is the understanding that this matter will be carried to the Supreme Court.

In the Bureau of Medical Economics, most of the work during the past year has been switched to the Procurement and Assignment Service. Work has been done on a prepayment medical service plan, but nothing very definite has been brought to a focus and most of the progress has been in study and observation. Do not, however, think for a minute that this question of the economic future of medicine, etc., has been dropped. Progress is always being made although something might overshadow it for the time being. One should constantly, every week, read his *Journal* very carefully in order to keep posted on proceedings of all Councils.

Several incidental things which are not distinctly connected are introduced at this time for your comment. The delegates approved setting up schools for medical laboratory technicians in medical schools approved by the Bureau of Medical Education. Another resolution that was discussed with emphasis was that concerning certificates to prostitutes who are particularly prevalent around Army Camps. Many have been issued certificates of good health by physicians. It was decided that this was decidedly unethical and was not approved of in any way, shape or manner.

An attempt was made by a resolution to increase the number of trustees from nine to eleven, so as to get a better distribution of the trustees as far as geographical areas are concerned. This, however, failed because eleven is too many. A better way to handle it would be to be more careful in the selection of trustees and this year a trustee was elected from California, which section of the country has not had representation before. The same question which came up last year about the *recognition of women* doctors as officers in the Army and Navy was again presented and again turned down. A resolution was introduced approving and encouraging the National Physicians Committee in the work which they have done, but clarified by the statement that this is not a branch, or in any way connected with the American Medical Association as an institution. There was a resolution introduced asking for recognition of the American College of Apothecaries. This was turned down because it is not the policy of the Association to recommend any Associations outside of our own profession.

A highlight of the evening meeting was an address by Mr. McNutt of Washington. His talk was on the need for physicians. He stated the United States needs 5,000 doctors by July 1, 1942, and there seems to be a lack of interest on the part of the medical profession. The Procurement program, he says, may fail. He stressed the need also of medical men in boom towns which have sprung up because of the defense program. If an adequate number of physicians do not volunteer for service, he said, it may be necessary for the government to draft them.

By and large, the attendance was a little less than it has been in previous years, during the first two days. Compared with the last meeting of the American

Medical Association there was only a loss of 300 in registration, at first, but on the third day this loss stepped up to nearly 1,000. The threat of war, the possibility of bombardment, a blackout of Atlantic City, along with the rubber shortage, detracted a great deal from the total. It was our impression, however, that the scientific exhibits and the commercial exhibits were on a par with any previous meeting that we have attended.

It may be said in general, that we believe that the American Medical Association is making very decided progress in furthering our individual interests as well as keeping medicine to the fore. They are keeping a sharp outlook on the question of Socialized Medicine and they are coöperating 100 per cent with the Army and Navy in the question of the Procurement and Assignment Board. If there is anything wrong anywhere, it is with the individual member and not with the Association itself.

Dr. Adson further reported as follows: You may be interested in a brief description of procedure in the House of Delegates. The very able speaker is Dr. Shoulders, a quick-witted Southerner, well versed in parliamentary procedure. Dr. Fouts of Omaha is vice speaker and these two are on the platform continuously with Dr. Olin West to keep them posted on agenda. All delegates receive a report with names of officers, reports from the councils and bureaus, a financial report of the association and names of reference committees. Resolutions are presented from the floor and referred to proper reference committees. Those interested in the resolutions may go before the reference committees. These committees are very active and tear them apart or bring in a majority or minority report or adopt them as the case may be. Anyone may bring in a resolution and it will be considered.

Among this year's resolutions was an interesting one brought in by Ohio and adopted and referred for action to the Board of Trustees which operates in the same manner as our council. This was a resolution to petition the Army for refresher courses for men in service so as to prepare them better for return to private practice. The resolution asking that women physicians be accepted in the medical corps of the Army was turned down again. Dr. Braasch told you about the resolution endorsing activities of the National Physicians' Committee. It was decided, in case the usual big meeting scheduled in 1942 at San Francisco had to be abandoned, the House of Delegates would meet in annual session at Chicago. Dr. Paullin of Atlanta was elected president and Dr. Hassig was reelected trustee.

The Speaker announced that a booth had been arranged by Mr. Rosell in the Armory as headquarters for Major Wood and Lt. Commander Miller who will be there to answer questions about service in the Army and the Navy. He then asked Dr. M. C. Piper, chairman of the Historical Committee, to present the following Necrology report:

NECROLOGY REPORT

Hallward M. Blegen, Warren. Born 1885. University of Minnesota 1909. Died March 26, 1942. Aged 57.

John H. Bong, Jasper. Born 1872. Minneapolis College Physicians and Surgeons 1897. Died December 13, 1941. Aged 69.

Donald R. Claydon, Red Wing. Born 1902. University of Louisville 1926. Died August 28, 1941. Aged 39.

Herman B. Cole, Redwood Falls. Born 1872. University of Buffalo 1896. Died March 29, 1942. Aged 70.

Raymond E. Doering, Minneapolis. Born 1894. St. Louis University 1924. Died January 13, 1942. Aged 48.

Eric O. Giere, Minneapolis. Born 1868. University of Minnesota 1892. Died February 12, 1942. Aged 74.

Norven H. Gillespie, Duluth. Born 1874. Queen's University 1896. Died March 26, 1942. Aged 68.

Robert Graham, Duluth. Born 1865. Wayne University 1893. Died September 22, 1941. Aged 76.

Stephen B. Haessly, Faribault. Born 1875. University of Illinois 1904. Died January 11, 1942. Aged 67.

Arthur L. Herman, Minneapolis. Born 1900. University of Minnesota 1923. Died April 24, 1942. Aged 42.

David J. Jacobson, Bemidji. Born 1891. Drake University 1913. Died April 17, 1942. Aged 51.

Joseph R. Kuth, Duluth. Born 1881. University of Minnesota 1904. Died August 1, 1941. Aged 60.
 J. C. Markoe, Saint Paul. Born 1856. Jefferson Medical College 1882. Died November 28, 1941. Aged 85.
 Charles F. McNevin, Saint Paul. Born 1877. Northwestern University 1908. Died February 16, 1942. Aged 65.
 William W. Moir, Minneapolis. Born 1881. University of Minnesota 1906. Died February 3, 1942. Aged 61.
 Reuben Pennington, Minneapolis. Born 1893. University of Minnesota 1930. Died February 25, 1942. Aged 49.
 John A. Pratt, Minneapolis. Born 1868. University of Michigan 1894. Died February 21, 1942. Aged 74.
 Franklin W. S. Raiter, Cloquet. Born 1889. Milwaukee Medical College 1911. Died October 2, 1941. Aged 52.
 Lemuel M. Roberts, Little Falls. Born 1862. Hahnemann Medical College 1883. Died October 9, 1941. Aged 79.
 Jesse A. Slocumb, Plainville. Born 1873. University of Illinois 1895. Died July 3, 1941. Aged 68.
 Edward O. Thorson, Luverne. Born 1875. Bennett College Eclectic Medicine and Surgery 1906. Died May 27, 1942. Aged 67.
 T. C. Clark, Minneapolis. Born 1853. Rush Medical College 1883. Died June 20, 1942. Aged 89.
 The meeting adjourned until 12:15.

Monday Session

Having ascertained from Dr. Bayley, chairman of the Committee on Credentials, that a quorum was present, the Speaker called for a report of the Council from Chairman W. L. Burnap.

Dr. Burnap thereupon reported that the Council at its Monday morning meeting had agreed to cooperate in every way possible with the work of the State Procurement and Assignment Committee and had directed that an article for MINNESOTA MEDICINE and a statement in the monthly News Letter should be prepared so that not only doctors in the draft age but all older physicians also would be informed.

The Council recommended, also, that the delegates to the AMA whose terms expire December 31, 1942, namely Dr. W. A. Coventry of Duluth and Dr. A. W. Adson of Rochester, together with alternates Dr. J. C. Hultkrans of Minneapolis and Dr. W. L. Burnap of Fergus Falls, be reelected by the House of Delegates.

Dr. E. J. Simons of Swanville, chief of the Medical Unit of the Division of Social Welfare and a member of the Council, reported for the information of the Council that selectees rejected from the draft because of tuberculosis cannot be accommodated for treatment at the present time in the county sanatoria because of lack of beds. These cases should be referred first to the family physician, and then referred by him, if necessary, to the sanatoria.

The request from the Editing and Publishing committee for approval of a new policy with respect to editorial notices about advertising matter in MINNESOTA MEDICINE was referred to the committee for an expression of opinion prior to taking action. It was suggested also that the committee confer with the editor of the *Journal of the American Medical Association* before adopting a policy in the matter.

The resolution presented to the State Conference of Social Work last spring calling for a radical increase in funds to be appropriated to public health work and medical care for the needy was tabled at the last conference of that body, Mr. Rosell reported. Appointment of a committee made up of representatives from the State Board of Health, the State Medical Association and the State Dental Association to meet and study the problem was made by the Conference as a substitute action.

Mr. Rosell also called attention of the Council to the report printed in the *Congressional Record* of a proposed Technical Corps made up of chiropractors to be organized under the Specialists Corps; also a bill introduced into Congress asking appropriation for setting up military medical schools in each Corps Area for two-year courses in medicine.

At the request of Dr. Burnap, Dr. Braasch outlined again the plan of the State Procurement and Assignment Committee to send out a letter to every man classified as available in the state. Those up to the age of thirty-seven plus a few others over thirty-seven who

are single men and can be spared from the community will be asked to apply for commissions at once. The older men up to forty-five will be asked to hold themselves in readiness for a call should the need arise.

Any men who feel that they have been classified mistakenly are to be invited to appeal their cases for a hearing by the state committee. Applications should be made preferably to Major Wood in the Medical Recruiting Board in the Lowry building in St. Paul or to the Surgeon General in Washington. Navy applications are to go to Lt. Commander Miller, Roanoke Building, Minneapolis.

In response to questions, Dr. Braasch reemphasized that the recipients of the letter should apply at once, that Selective Service would also be supplied immediately with names of men who have been made available. It was moved, seconded and carried that the report of the Council be accepted.

Dr. Burnap moved that the delegates pass a vote of confidence in Dr. Braasch and the State Committee on Procurement and Assignment and that they express the willingness of the association to cooperate in every way possible. The motion was seconded and carried unanimously.

The Speaker then called on Dr. R. L. J. Kennedy of Rochester, chairman of the Committee on Child Health to report on the plan for aid to mothers and babies of men in service.

DR. KENNEDY: In a communication from the United States Department of Labor, Children's Bureau, Division of Health Services, to Dr. A. J. Chesley, it was recommended that State Health Agencies develop plans to finance from MCH funds the obstetric, pediatric and hospital care needed by wives and children of men in active military service who are unable to pay for such care.

In order to make this possible the Children's Bureau has set aside 10 per cent of the MCH fund B, appropriated for the fiscal year 1943, which amounts to \$198,000, for allotment to the State Health Agencies wishing to establish these services.

This committee recognizes as does the state association that the problem in question, if it exists, is one which must be met for the duration of the present war.

Pursuant to suggestions received from the Director of the Division of Health Services, Children's Bureau, United States Department of Labor, and in view of the conditions which may develop in our state during the present war, this committee desires to submit to the House of Delegates the following recommendations:

1. That the Minnesota State Medical Association approve of a request by the State Board of Health to the Children's Bureau for funds with which to defray the cost of this service in Minnesota. The amount necessary to carry on such a program in this state cannot be determined with accuracy at this time because of the unknown factors involved. It is suggested, however, that information on which to base the amount to be requested can and will be obtained by the State Board of Health through contact with the various County Welfare Boards and the American Red Cross Chapters and other sources, relative to the present case load and to the recent past experience in this field. While it is impossible to formulate in detail plans for carrying out the program, certain principles should be adhered to in so far as possible.

2. *Eligibility.*—All expectant mothers in the state, irrespective of legal residence, whose husbands are in active military service (U. S. Army or U. S. Navy, including Marine Corps and Coast Guard) and not commissioned officers, should be eligible for obstetric and hospital services provided under the MCH program, without cost to the family, whenever to the knowledge of the state health agency such obstetric and hospital services are not otherwise available. Any child under 1 year of age whose father is in active military service, but not a commissioned officer, may be eligible for pediatric and hospital care under the MCH plan.

(NOTE: "Under 1 year of age" is suggested since the present funds available are insufficient to provide care for all children in these families.)

3. It has been agreed in this committee that in order to
 - (a) expedite the carrying out of the program
 - (b) define sharply the responsibility of the federal, state, and local agencies involved in the program and
 - (c) avoid the cost of separate administration, it is proposed that the County Welfare Boards with the aid and advice of

PROCEEDINGS EIGHTY-NINTH ANNUAL SESSION

their respective medical advisory committees be asked to assume the responsibility of determination of eligibility for this assistance. Suitable forms will be supplied by which requests for this assistance may be made either upon the patient's application to the County Welfare Board or to her attending physician. Such request for assistance properly filled out will be submitted by the County Welfare Board to the State Department of Health for approval and authorization. In cases where the necessity for consultation arises, the proper consultant shall be supplied through arrangement with the county medical advisory committees.

4. Services are to be rendered by doctors of medicine licensed to practice in Minnesota by the State Board of Medical Examiners.

5. Hospitalization should be authorized only in those hospitals that have been listed by the State Board of Health for this purpose.

6. Cost of obstetric, pediatric and hospital service: obstetric and pediatric fees should be paid for in conformity with the average current fees for such services as have been found to obtain in 60 of the 84 rural counties of the state, as determined in the survey of medical fees in Minnesota made by the state-wide medical advisory committee in 1941. It is estimated that the average cost for the care of the normal obstetric case will be \$35; for hospital care for mother and baby \$35; and for care of the baby during first year of life \$30.

7. Payments should be made to the attending physician by the State health agency upon the receipt of a satisfactory maternity or pediatric record, on forms prepared by the State health agency for the use of the attending physician.

8. Hospital care that has been authorized by the State health agency should be paid for at the per diem rate of the hospital concerned. Pediatric care should also be paid for on this per diem basis. Payments should be made to the hospital upon receipt of record showing the date and hour of admission and discharge of each patient for whom care was authorized by the State MCH director.

DR. KENNEDY: This is not a detailed recommendation because details are impossible to work out. It is a statement of principles for your consideration, requested by Dr. Chesley as a guide for State Board of Health action which must be made this month.

It was moved that the recommendation be accepted and the Speaker called on Dr. Helen Curtis of the Children's Bureau in Washington to discuss the matter.

DR. CURTIS: These recommendations appear to meet the principal requirements of the Children's Bureau. Of course they may vary from state to state to meet local situations. For instance, in some states it is not possible to require 10 days' hospitalization because beds are insufficient. In some states it may not be possible to require that all medical participants be graduates of Class A schools. Your recommendations call for regularly licensed practitioners. I do not know what is required for a license in Minnesota.

At the request of the Speaker, Dr. Adson informed Dr. Curtis that licensees in Minnesota are required to graduate from a Class A school, to be American citizens and to pass basic science and State Board of Medical Examiners' examinations.

Dr. Curtis declared that the requirement for license here would more than meet Children's Bureau requirements for those who are to give service under the plan.

Dr. Curtis said, in response to questions from the floor, that it was not expected that Social Security funds would finance the plan beyond the first few months, but that, where necessary, new funds would be asked later for the purpose; that the plan would be administered through the State Board of Health; that each state would make its own estimate of the amount needed to administer the plan and that the staff of maternal and child health divisions of the departments of health would be used generally, and that it would certainly be an economy to use existing Social Service agencies also; that only those soldiers' wives would benefit who were unable to obtain care out of their own resources, assuming that most men who are not receiving officers' pay might find it difficult to finance obstetric care, but each individual case would be considered on its merits; that no one state would receive less, depending upon the need; that funds come from appropriations already made and earmarked as an emergency measure for this purpose, though states may use other funds allotted for maternal and child health if the plan is approved. In cities where there are general hospitals, patients already eligible for care

there would not be included in the plan but many wives moving about with their husbands would not be eligible to care in clinics and hospitals set up for care for local needy. In some cases the patient might be able to make part payment on care received and that principle should be adhered to wherever possible. The plan is set up with the idea in mind of starting things moving in the emergency and Dr. Curtis said, further, that women who for some reason were unable to get into a hospital would have to be delivered under the plan in their own homes. She was unable to answer the question about what would happen to the plan when the war is over. It is being set up to care for an emergency due to war service.

Dr. L. A. Barney of Duluth suggested from the floor that the plan looked like a form of state medicine. The motion to accept the recommendations of the committee was seconded and carried.

The Speaker then called upon Dr. R. W. Morse of Minneapolis, chairman of the Committee on Resolutions. Dr. Morse read the following resolutions, all of which were unanimously accepted.

WHEREAS we are now engaged in a war for the survival of our nation and our freedom and

WHEREAS the needs of our armed forces and of our industrial mobilization to provide the weapons and equipment needed by our brave fighting men supercede all lesser considerations having to do with the pursuits and aims of peace, be it therefore

RESOLVED that this House of Delegates here go on record pledging the members of the Minnesota State Medical Association individually and as an organization to devote themselves exclusively during the coming year and until the war is won to the provision of all needed medical services to the armed forces and to the civilian population at home regardless of what individual hardships it may entail; to do everything that may be in their power to improve the health of workers on the industrial front and to aid in organization of medical protection in civilian defense against attack and sabotage at home to the end that medicine may continue in the high tradition of sacrifice and service established by our forebears in Minnesota.

* * * * *

WHEREAS a bill known as H. R. 7231 has been introduced into the Congress which provides for nine schools of military medicine to be organized and operated on the plan of the military and naval academies at West Point and Annapolis and

WHEREAS it is proposed in this bill that students with pre-medical training shall be accepted by Congressional appointment and shall be given a brief course on military surgery, leaving out much of the basic training necessary to the practice of all the specialties, including military surgery, and all of the training in branches that do not pertain directly to the care of soldiers in the armed forces and

WHEREAS graduates of these schools, one in each Corps Area, would be commissioned as officers in the Army Medical Corps and would be available, according to the sponsor of the bill, to man many government services after the war is over including the Veterans' Administration Facilities, the United States Public Health Service, and any government health insurance project which might be set up in the future, and

WHEREAS the existence, under government sponsorship, of schools whose graduates, though inadequately trained, would be accepted as physicians because of their commissions in the Army Medical Corps would endanger the high standards of medicine developed in America after a period of long and painful endeavor on the part of physicians and educators with the staunch support and cooperation of high officials in the Army, Navy and Marine Corps, Be it therefore

RESOLVED that this House of Delegates go on record in unanimous disapproval of any schools of medicine which do not offer a well-rounded course in accordance with the best standards of medical education in America and that this resolution be sent to members of the House and the Senate from Minnesota.

* * *

WHEREAS the State Board of Health has carried on a consistent sound and forward looking program of public health and preventive medicine in Minnesota during the past year in spite of heavy demands occasioned by the war emergency and

WHEREAS the Board has also generously cooperated with its endorsement and with material aid in the special programs undertaken by the Minnesota State Medical Association including the tuberculosis control program, the campaign for vaccination and immunization, the program and studies of the Committee on Maternal Health and the nutritional program, especially in the preparation, publication and distribution of the four nutrition pamphlets which formed an important part of the campaign for better nutrition in the state,

BE IT RESOLVED that this House express its profound appreciation to the Board and to Dr. A. J. Chesley, secretary and executive officer, and his staff, for their interest and assistance in these special programs and for their fine cooperation with the doctors of the state in all movements looking to the improvement of the health of the people of Minnesota.

WHEREAS the State Board of Health has carried on an outstanding program for control of preventable disease and especially of venereal disease in this state for many years, and

WHEREAS this notable program which has reduced the incidence of syphilis in Minnesota to a rate which is below that of most of the states in the country by utilizing expert medical services on a part-time basis, and

WHEREAS this policy has had the approval and close coöperation of the entire medical profession of the state, Be it Therefore

RESOLVED that the House of Delegates of the Minnesota State Medical Association hereby officially endorses the policy of the Minnesota State Board of Health with respect to control of preventable disease and regards with disapproval the suggestion recently made by the United States Public Health Service that full-time medical service be substituted for it in the program of disease control in Minnesota.

The thanks of this House are extended to the St. Louis County Medical Society and the Committee on Local Arrangements headed, in the absence of Dr. T. G. Clement, by Dr. M. McC. Fischer for their fine entertainment and excellent arrangements which have contributed so much to the interest and enjoyment of this great meeting.

The Appreciation of this House is likewise accorded to Radio Stations KDAL, WEBC and WDSM for their generous contribution of time for broadcasts by our distinguished guests. Such broadcasts constitute a valuable addition to our program of public education about the developments of medical science and the progress of our control over disease.

To the newspapers and news services of the state for their extensive and accurate reporting of the events of this meeting this House expresses its gratitude and its recognition also, of the invaluable assistance given by the press throughout the year to the program of public health education carried on by this association.

The House of Delegates also wishes to note the unflinching courtesy and helpfulness of the Hotel Duluth and its staff and to record especially its thanks to the manager, Mr. Siegrist, for his generous attention to the comfort and convenience of all who have attended the many business committee meetings and entertainments housed in this hotel.

The Speaker then called for nominations for the office of president-elect.

Dr. J. M. Hayes of Minneapolis placed in nomination the name of *Dr. Stephen H. Baxter* of Minneapolis for *President-elect*. There being no other nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary be instructed to cast a unanimous ballot for Doctor Baxter.

DR. BAXTER: When you contemplate something that may perhaps take place in the future, you think you can prepare for it and being forewarned is to be forearmed! But when the event comes, it takes your breath away anyway, and you find yourself speechless. Fortunately this is not the time for a speech, anyway, and so I shall content myself by saying thank you for this great honor.

Dr. J. F. Norman of Crookston was then nominated for *First Vice President* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary cast a unanimous ballot for Dr. Norman.

Dr. F. W. Lynch of Saint Paul was nominated for *Second Vice President* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary cast a unanimous ballot for Dr. Lynch.

Dr. B. B. Souster of Saint Paul was nominated to succeed himself as *Secretary* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Executive Secretary cast a unanimous ballot for Dr. Souster.

Dr. W. A. Condit of Minneapolis was nominated to succeed himself as *Treasurer* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary cast a unanimous ballot for Dr. Condit.

Nominations for the office of Speaker of the House of Delegates being called for, Dr. E. A. Meyerding of Saint Paul, Vice Speaker, took the chair.

Thereupon, Dr. W. W. Will of Bertha was nominated to succeed himself as *Speaker* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary cast a unanimous ballot for Dr. Will who then resumed the chair.

Dr. E. A. Meyerding of Saint Paul was nominated to succeed himself as *Vice-Speaker* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary cast a unanimous ballot for Dr. Meyerding.

Dr. A. E. Sohmer of Mankato was nominated to succeed himself as *Councilor of the Fourth District*, and there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary cast a unanimous ballot for Dr. Sohmer.

Dr. Archie E. Cardle of Minneapolis was nominated as *Councilor of the Sixth District*, and there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary be instructed to cast a unanimous ballot for Dr. Cardle.

Dr. W. L. Burnap of Fergus Falls was nominated to succeed himself as *Councilor of the Eighth District* and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary be instructed to cast a unanimous ballot for Dr. Burnap.

Dr. W. A. Coventry of Duluth was nominated to succeed himself as *delegate to the American Medical Association*, and there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary be instructed to cast a unanimous ballot for Dr. Coventry.

Dr. J. C. Hultkrans of Minneapolis was nominated to succeed himself as *alternate* for Dr. Coventry and, there being no further nominations, it was moved, seconded and carried that the Secretary cast a unanimous ballot for Dr. Hultkrans.

Dr. A. W. Adson of Rochester was nominated to succeed himself as *delegate to the American Medical Association*, and, there being no further nominations, it was moved, seconded and carried that the nominations be closed and that the Secretary be instructed to cast a unanimous ballot for Dr. Adson.

Dr. W. L. Burnap of Fergus Falls was nominated to succeed himself as *alternate* to Dr. Adson and there being no further nominations, the Secretary was instructed to cast a unanimous ballot for Dr. Burnap.

An invitation to meet in 1943 in Minneapolis was extended by Dr. J. M. Hayes.

It was moved, seconded and carried that the invitation be accepted and that the 1943 meeting of the association, if it is to be held, take place in Minneapolis.

SPEAKER W. W. WILL: It is my belief that not enough of the information and stimulation that comes out of these state meetings goes back to the county societies. I believe that the men back home should be informed immediately of what this House has done and that the problems brought up here should be more thoroughly discussed in our own societies. I should like to suggest, therefore, that the first meeting of all our societies following the state meeting be devoted exclusively to reports from the delegates and that others besides the delegates who took part in this session be invited to speak.

Dr. Hayes asked what plans had been made for newspaper publicity to counteract unfavorable notices already printed about the slowness of doctors to enlist in the armed services.

Dr. Braasch sketched again the plan of the State Committee on Procurement and Assignment which calls for a letter to all who have been classified as available, articles for MINNESOTA MEDICINE and the *News Letter* and statements to the newspapers showing the considerable contribution already made by Minnesota to the war effort.

It was pointed out by Dr. A. G. Liedloff of Mankato that many physicians who are over-age by present government standards have tried to apply and are willing to go as soon as they can be admitted.

There being no further business to come before the House, it was moved, seconded and carried that the meeting adjourn.

REPORTS and ANNOUNCEMENTS

AMERICAN COLLEGE OF SURGEONS CANCELS CLINICAL CONGRESS

The annual Clinical Congress of the American College of Surgeons which was scheduled to be held in Cleveland, November 17-20, 1942, was cancelled by the Board of Regents of the College at a meeting held in Chicago, Wednesday morning, October 14. Motivated primarily by patriotism, the Regents were influenced by the present conditions surrounding the general war program which have led to a greater burden on the members of the surgical profession in their local communities as a result of the large proportion of the profession which is serving with the armed forces. The Regents by this action took cognizance of the desire of the profession to do nothing which would interfere with the successful prosecution of the war program such as would be caused by temporary absence of its members from civilian duties during the period of the Congress, embarrassment of the transportation system, and interference with the work of the local profession in Cleveland in preparations and presentations incident to such a meeting.

PEPTIC ULCER FILM

There is now available for free showings before groups of physicians the first complete movie film on peptic ulcer, in color and with sound track.

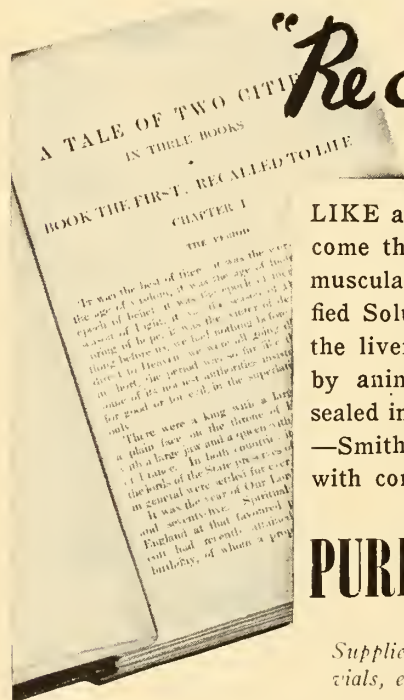

The film is entitled "Peptic Ulcer" and was produced under the direction of the Department of Gastroenterology of the Lahey Clinic of Boston. The American College of Surgeons has awarded its seal of approval to the film.

Running time of the film is forty-five minutes, 1,600 feet of 16 mm. film, and covers a presentation of the following problem of peptic ulcer: Pathogenesis, diagnosis, treatment, pathology, complications, including obstruction, hemorrhage, and perforation, gastric ulcer, surgery and jejunal ulcer.

Arrangements for a showing of the film may be made by writing to the Professional Service Department of John Wyeth and Brother, Inc., Philadelphia, who will provide projection equipment, screen, film, and operator for medical groups, without charge.

MINNESOTA SOCIETY OF INTERNAL MEDICINE

At the meeting of the Minnesota Society of Internal Medicine held in Rochester, October 29, 1942, Dr. Paul G. Bowman of Duluth was elected president; Dr. B. T. Horton of Rochester, vice president, and Dr. Reuben G. Johnson of Minneapolis, secretary-treasurer (re-elected).

"Recalled to Life"

LIKE a call to renewed life for the pernicious anemia patient, come the latest developments in liver therapy. . . . For intramuscular injection, Smith-Dorsey has prepared a U. S. P. Purified Solution of Liver containing all the fraction G (Cohn) of the liver extract. Rigidly standardized . . . twice tested by animal injection to prevent local tissue reaction . . . sealed in ampoules and vials . . . finally tested for sterility—Smith-Dorsey offers a product to which physicians can turn with confidence.

PURIFIED SOLUTION of LIVER

Supplied in 1 c.c. ampoules and 10 c.c. and 30 c.c. ampoules, each containing 10 U.S.P. Injectible Units per c.c.

The Smith-Dorsey Company

LINCOLN ♦ NEBRASKA

Manufacturers of Pharmaceuticals to the Medical Profession since 1908

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

The Southern Minnesota Medical Association elected Dr. Alphonse E. Sohmer of Mankato as president at its annual meeting on September 28 at Rochester. He succeeds Dr. N. W. Barker of Rochester.

Dr. Fred L. Bregel, Saint James, was named first vice president; Dr. Ernest M. Hammes, Saint Paul, second vice president. Dr. Austin C. Davis, Rochester, was reelected secretary-treasurer.

New members accepted into the society are Dr. L. Loomis, Winona, and Drs. G. G. Stilwell, D. Pugh, K. M. Simonton, Walter F. Kvale and W. Dearing, all of Rochester.

Announcement was made that the medal and \$100 prize given annually by the society to the most proficient student in the University of Minnesota medical school graduating class had been awarded this year to Dr. John Schulze.

Drs. A. H. Wells, S. Boyer, Jr., and R. L. Nelson of Duluth were awarded the Society's medal for the best exhibit at the Minnesota State Medical Association's annual meeting. Their exhibit was on "Calcified Nodular Disease of the Aortic Valve."

Richard J. Dorer of the state department of conservation spoke at the dinner on "Our Most Fundamental National Problem: Conservation." Short talks were also given by Dr. H. Z. Giffin, president of the Minnesota State Medical Association, and Dr. Barker.

Civilian and industrial accidents were discussed by Mrs. P. F. Dwan and R. C. Webb, Minneapolis, and Mrs. H. K. Gray, R. K. Ghormley, H. H. Young, W. H. Mickel, T. H. Seldon and E. G. Wakefield, Rochester.

SOUTHWESTERN AND LYON-LINCOLN SOCIETIES HOLD JOINT MEETING

The first of a series of two joint meetings of the Southwestern and the Lyon-Lincoln Medical Society groups was held October 6 at Slayton. Dr. P. W. Harrison of Worthington, president of the Southwestern Society, presided at the sessions.

Among those appearing on the program were Dr. R. K. Ghormley of Rochester, who spoke on "Fractures" and Dr. P. W. Brown, also of Rochester, who presented the subject "Intestinal Diseases."

Because of the central location of Slayton the second joint meeting will be held there also. This choice was made in the interest of conserving gasoline, oil and tires.

Arrangements for the meeting were made by Dr. Roy F. Pierson of Slayton.

WABASHA COUNTY SOCIETY

The Wabasha County Medical Society held its seventy-fourth annual meeting at Lake City, Thursday, October 8, 1942, Dr. R. A. Glabe, president, presiding.

At the business session in the afternoon, the following officers were elected for the coming year:

President—T. G. Wellman, Lake City
Vice President—D. P. Dempsey, Kellogg
Secretary-Treasurer—W. F. Wilson, Lake City
Delegate to the State Association—E. C. Bayley, Lake City (reelected)
Alternate—E. W. Ellis, Elgin
Censor for three years—D. G. Mahle, Plainview (reelected)
Censors holding over—W. J. Cochrane, Lake City and W. H. Replogle, Wabasha

NOVEMBER, 1942

Industrial Workers with LAME BACK

Often Put Back On Job Quickly

by means of a

SPENCER SUPPORT

Higher morale—greater efficiency—longer hours of work with less fatigue often follow when a worker wears a Spencer Support designed especially for him (or her).

Spencers designed for patients with lame back restore balance — lessen movement of part when desirable—afford protection—support abdomen. Frequently, instantaneous relief is experienced.

Spencer Supports are designed of *non-stretchable fabric*. Spencer designers have never used rubber to make a corset fit or as a means of support. All Spencers are light, flexible, easy to slip on and adjust—readily laundered—exceptionally durable. They permit perfect freedom of action.

Every Spencer is guaranteed never to lose its shape. (Ordinary supports soon stretch out of shape and become useless before worn out.)

For service at patient's home, your office or hospital, look in telephone book under "Spencer Corsetiere" or write to us.

Pictured above—Spencer Sacro-iliac Support for women. A pad is held snugly against sacrum by means of flat bands that encircle pelvic girdle inside garment and merge outside.

At left—Spencer Support for Men. Can be slipped on in a jiffy, and adjusted to whatever degree of support is required by means of flat tapes and slides.

May We Send You Booklet?

A pheasant dinner was served to the members, the wives, and invited guests through the courtesy of the Lake City physicians.

At the scientific session in the evening, the following program was presented:

PRESIDENT'S ADDRESS—"Pain as a Symptom of Appendicitis"—R. A. GLABE, M.D., Plainview.

REPORT on the Proceedings of the House of Delegates at the Annual Meeting held at Duluth, June 29 to July 1, 1942.—E. C. BAYLEY, M.D., Lake City.

MOTION PICTURE DEMONSTRATIONS

I. "Proctoscopic Diagnosis"—N. D. SMITH, M.D., May Clinic, Rochester.

II. "Correction of Nasal Deformities"—From the Washington University School of Medicine.

Dr. A. J. Chesley, executive officer of the State Board of Health, gave a short talk on the civilian defense program.

Dr. V. O. Wilson reported on the new rules pertaining to maternity and child welfare care in the families of those absent in military service.

There were twenty-nine in attendance, including members and guests.

W. F. WILSON, *Secretary*.

WASHINGTON COUNTY SOCIETY

The regular monthly meeting of the Washington County Medical Society was held October 13. The secretary reported that examinations of the 4H Club members of the county were made as usual during September by the Stillwater doctors.

Guests at the meeting were Dr. A. J. Chesley, Executive Secretary of the Minnesota State Board of Health and Dr. D. A. Dukelow, also of the State Board, who addressed the meeting on Public Health Nursing, its great value to any community and how to obtain nurses for such work in counties not now so favored. Dr. Chesley made some comments and in addition briefly touched on the health situation now and as it is going to be affected by the war.

E. SYDNEY BOLEYN, M.D., *Secretary*

WEST CENTRAL SOCIETY

The West Central Medical Society held its fortieth anniversary meeting in Morris, October 14, 1942. Judge E. R. Selnes gave a talk on "Medical Jurisprudence" and Dr. C. E. Caine spoke on "The Medical History of Stevens County."

Dr. F. W. Behmler was elected president; Dr. Otto Bergan, vice president; Dr. Herman Linde, secretary-treasurer; Dr. C. I. Oliver, delegate to the state convention, and Dr. Charles Bolsta, alternate.

At this meeting there were four charter members in attendance: Drs. Charles Bolsta, E. E. Caine, J. R. Elsey and C. I. Oliver. Each one of these members made an appropriate speech for the occasion. At the time the West Central Medical Society was organized there were fourteen charter members; at the present time the membership is twenty-eight.

INDUSTRIAL HEALTH

(Continued from Page 901)

factor. It may provide a variety of movements or it may use a few muscles over and over again. Skilled labor is more fatiguing than unskilled labor. Speeds of work above that which give maximum efficiency and above the natural rhythm of the workers are unfavorable.

Group Diagnosis Helps

One of the simplest ways to learn whether the ill health, accident proneness and loss of efficiency of a worker are due to fatigue incident to occupation is to examine the group in which he works. Although there are individual differences in the reaction to occupational environment, certain common factors provide necessary data for group diagnosis. These include occupational mortality and morbidity rates, accident and efficiency rates, short-time absence and labor turnover rates.

A physician is an unfortunate gentleman who is every day called upon to perform a miracle, namely to reconcile intemperance with health.—VOLTAIRE.

Hennepin County

The year's program for the Hennepin County Auxiliary opened with a tea for new members and officers at the home of Mrs. Frederick Schaaf.

Two new projects are under way in Hennepin County this year. One is the Red Cross dressing group, which was organized last year, but, due to lack of supplies, did not begin to function until this year. Mrs. J. P. Hiebert is chairman with Mrs. J. M. Hall acting as co-chairman.

The second activity is the staffing of a War Savings Stamp booth in the Medical Arts lobby with Mrs. Hugh Tunstead in charge. Both war projects are carried on with the coöperation of the Dental Auxiliary.

Nicollet-Le Sueur County

The auxiliary of the Nicollet-Le Sueur County Medical Society met September 22, 1942, at St. Peter. Dr. A. V. Stoesser of the University of Minnesota department of Pediatrics spoke on "Allergy." Mrs. J. P. Josewski, State President, spoke to the assembly.

◆ OF GENERAL INTEREST ◆

Dr. Walter A. Carley announces the opening of offices at 1124 Lowry Medical Arts Building, Saint Paul, with practice limited to Psychiatry and Neurology.

* * *

Dr. T. F. Crabbe, member of the staff of the Cass Lake Indian Hospital since July, left in October for South America. He will be in government service in Brazil, where he is being sent because of his knowledge of tropical diseases.

Lymanhurst Hospital has now been officially designated as the Elizabeth Kenny Poliomyelitis Institute and Miss Kenny's clinic is established there and will operate under its present financial setup until January 1, when the Minneapolis Welfare Board will set up a Board of Trustees to supervise finances after that time. The city heart clinic now being operated in the same building will continue there, but its budget will be kept separate from that of the Poliomyelitis Institute, according to an announcement by the Welfare Board.

* * *

Wives and babies of soldiers and sailors in enlisted grades who are shown to be in need will be provided with obstetrical and pediatric care through a special fund provided to the State Board of Health by the Children's Bureau. Applications for this assistance will be investigated by the County Welfare Boards in the same manner as other aids to the needy. If approved, physicians giving the service will be paid direct by the State Board of Health. The fund is limited to \$10,000 and existing facilities must be used first. The plan was approved by the Committee on Child Health. An initial survey showed some 411 mothers and 114 children in need of care. Applications for aid must be signed by physician and patient. Forms are available at county welfare boards or the Division of Maternal Health, State Board of Health.

* * *

Dr. Thomas Francis, Jr., chairman of the Department of Epidemiology, School of Public Health, University of Michigan, and Director of the Influenza Commission of the United States Army, gave the Clarence Martin Jackson lecture provided each year by the Phi Beta Pi medical fraternity, at the University of Minnesota, October 21, 1942.

In his lecture entitled "An Interpretation of Current Studies in the Control of Epidemic Influenza," Dr. Francis brought out the facts that influenza is a virus disease, transmitted directly through the respiratory tract and that gauze masks are useless in preventing infection. The infection destroys the ciliated columnar epithelin of the respiratory tract. Natural immunity which exists in a certain percentage of individuals is acquired during an attack and may last a few months. One may be immune to one of the two types, termed A and B, and not to the other. Subcutaneous and intramuscular injection of the living virus fails to pro-

duce the disease. The development of immunization
measures is more likely to be effected through intra-
nasal methods than by injection.

* * *

John Reginald McCarthy, son of Dr. W. R. McCarthy
of Saint Paul, was recently awarded the Navy Cross,
the highest award given by the Navy, for his extraor-
dinary heroism and contribution to the success of a
naval engagement.

Lieutenant (j.g.) McCarthy graduated in 1939 from
the Aero-Engineering School of the University of Min-
nesota, was called into service in September, 1939, and
obtained his commission in June, 1940. The same month
he married Elizabeth Rosacker of Minneapolis and the
day following the ceremony flew to the west coast
where he was immediately assigned to sea duty and
dive bombing in particular. On the morning of Decem-
ber 7, 1941, he was flying toward Pearl Harbor in com-
pany of another plane piloted by Lieutenant Clarence E.
Dickinson when he was shot down. In bailing out he
suffered a leg fracture but was picked up and taken to
the hospital at Pearl Harbor where he spent two
months. Later in the Midway battle, after shooting
down two Japanese Zero planes, he ran out of gas,
bailed out again, but in so doing suffered a broken nose
and laceration of the scalp. Fortunately he was picked
up from his rubber life boat by a destroyer and by
coincidence his scalp wounds were sutured by Dr. John
H. Peterson of Duluth. Soon transferred to another
vessel and taken back to Pearl Harbor, he miraculously
escaped the destruction of the destroyer from which
only nine of the personnel were saved. Because he
failed to get back to his carrier he was first reported
missing. He is now in this country.

* * *

A portrait of Dr. W. H. Valentine of Tracy by
Walter Scott Darr, a well-known portrait artist of
New York City, was presented to the Tracy Hospital
by Dr. H. F. McChesney of Brooklyn, New York, a
cousin and classmate of Dr. Valentine at Carleton
College in the nineties. Dr. McChesney is a native of
Minnesota and took his medical training at Johns Hop-
kins, beginning practice in Brooklyn in 1901. Dr. Val-
entine obtained his medical degree at the University
of Minnesota in 1900 and in May of that year began
practice in Tracy. Unable to attend the presentation
ceremonies Dr. McChesney wrote in a letter to the fam-
ily:

"I am presenting this portrait to the Tracy Hospital
in recognition of Dr. Valentine's personal worth as
well as his professional ability and a life-long devo-
tion to the people of his community and the establish-
ment of a hospital to minister to the needs of the com-
munity—not only for the present but for many years
to come. I have a very profound appreciation of the
work and constructive effort Walter has expended for
the good of his clientele and community.

"This hospital is really a monument and memorial
for generations to come. Walter's work and devo-
tion should live long after the present contemporary
people of his community have passed on."

At the 101st Annual Meeting of the State Medical Society of Wisconsin held in Milwaukee, September 4, 15 and 16, Minnesota members of the medical profession participated in both the General Session presentations and the Round Table discussions. Those who appeared on the program were:

General Sessions—Arlie R. Barnes, Rochester, "Diagnosis of Pathologic Conditions of the Heart"; S. W. Harrington, Rochester, "Constricting Pericarditis"; Wesley W. Spink, Minneapolis, "The Clinical Applications and Complications of the Sulfonamides"; E. H. Rynearson, Rochester, "Actual Clinical Disturbances of the Endocrine Glands"; E. A. Hines, Jr., Rochester, "The Range of Blood Pressure and Hereditary Factors in Normal and Hypertensive States"; E. T. Bell, Minneapolis, "The Pathology of Hypertension"; Wallace H. Cole, Saint Paul, "The Kenny Treatment of Anterior Poliomyelitis"; H. O. McPheeters, Minneapolis, "The Present-Day Treatment of Varicose Veins"; E. L. Pool, Rochester, "The Treatment of Urinary Tract Infection with the Sulfonamide Group of Drugs."

Round Table Discussions—Arlie R. Barnes, Rochester, "The Cardiac Problems of the General Practitioner"; Wesley W. Spink, Minneapolis, "Medical Management of Gall-bladder Disease"; E. H. Rynearson, Minneapolis, "The Practical Use of Hormones"; H. O. McPheeters, Minneapolis, "Injection of Varicose Veins"; Wallace H. Cole, Saint Paul, "Orthopedics in Children"; E. T. Bell, Minneapolis, "The Etiology of Primary Hypertension"; E. A. Hines, Jr., Rochester, "The Prevention and Treatment of Thrombosis and Embolism."

On the Wednesday morning Motion Picture Program Dr. H. O. McPheeters presented a picture on "Skin Graft."

* * *

The American Gastroenterological Association on January 1, 1943, will publish the first issue of a new journal to be called *Gastroenterology*. The new journal will be owned by the Association, will be the official publication of the Association, and will be published by Williams and Wilkins Company. It will appear monthly, and the subscription price will be \$6.00 per year.

Dr. W. C. Alvarez will be the editor (after June, 1943) and Dr. A. C. Ivy will be the assistant editor. The Editorial Board will consist of Doctors A. H. Aaron (Buffalo), J. A. Barger (Rochester), H. L. Dockus (Philadelphia), W. C. Boeck (Los Angeles), J. B. Crohn (New York), R. Elman (St. Louis), F. Hollander (New York), Sara Jordan (Boston), J. L. Kantor (New York), B. R. Kirklin (Rochester), P. Klemperer (New York), F. H. Lahey (Boston), F. C. Mann (Rochester), H. J. Moersch (Rochester), V. C. Myers (Cleveland), W. L. Palmer (Chicago), J. M. Ruffin (Durham), R. Schindler (Chicago), and D. L. Wilbur (San Francisco).

Gastroenterology invites for publication clinical and investigative contributions which are of interest to the general practitioner as well as the specialist and which deal with the diseases of digestion and nutrition, including their physiological, biochemical, pathological, parasitological, radiological and surgical aspects.

Physicians in Service

Minnesota physicians who have been called to active duty this month include the following:

Dr. Paul C. Benton of Gibbon is at Camp Barkeley, Texas, serving as a First Lieutenant on the Army hospital staff. His practice will be cared for during his absence by Dr. J. E. Schroepel of Winthrop and Dr. A. L. Kusske of New Ulm.

Dr. R. V. Fait of Little Falls is at Bremerton, Washington, at the Puget Sound Naval Hospital. His practice at Little Falls will be in the hands of his associate, Dr. Douglas L. Johnson.

Dr. L. H. Heinz of Hastings has been commissioned First Lieutenant in the Medical Corps and has reported for service at the Aviation Cadet Center in San Antonio, Texas.

Dr. L. J. Monson of Hendricks has reported to the Navy Hospital at San Diego, California, for training. He is commissioned a Senior Lieutenant in the Naval Reserve.

Dr. Harry B. Neel of Albert Lea will serve as Lieutenant at the Bremerton Naval Hospital, Bremerton, Washington.

Dr. A. M. Nielsen of Northfield has reported to Mare Island, San Francisco, California, as an assistant surgeon in the Medical Corps of the U. S. Navy. He has the rank of Lieutenant, Junior Grade.

Dr. M. O. Nesholm of Emmons has been inducted as a First Lieutenant in the medical division of the U. S. Army Air Corps.

Dr. Orien B. Patch of Duluth has been commissioned as a Captain in the Army Air Force and is now on duty at the Lincoln Air Base Hospital, Lincoln, Nebraska.

Dr. Russell O. Spittler of New Richland has been called to serve as Captain in the Medical Corps of the Army and has reported for duty at Fort Sam Houston, Texas.

Hospital News

Dr. J. A. Cosgriff of Olivia has opened a hospital annex of several rooms to his present office. Rooms on the second floor have been remodeled and equipped for the use of patients.

* * *

Through the efforts of the American Legion Auxiliary and public contribution, a number of towns in Minnesota have received hospital equipment for use by the entire community. At Faribault a resuscitator has been purchased. Olivia has a portable fracture bed which will be used by several other towns in the vicinity including Danube, Renville, Sacred Heart, Bird Island, Hector, Buffalo Lake, Fairfax, Franklin and Morton. Oxygen tents, three in number, have been purchased for use of patients in Anoka, Cambridge and Princeton and the surrounding rural areas. At Mahtomedi a combination patrol car and ambulance will serve the community.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

THE ESSENTIALS OF EMERGENCY TREATMENT. Compilation of a series of articles by various authors. Sponsored by Connecticut State Medical Journal. 144 pages. Price \$1.00, paper; \$2.00, cloth. New Haven: Connecticut State Medical Journal, 1942.

CLINICAL ANESTHESIA—A Manual of Clinical Anesthesiology. John S. Lundy, B.A., M.D. Head of Section on Anesthesia, Mayo Clinic; Professor of Anesthesia, Mayo Foundation for Medical Education and Research, Graduate School, University of Minnesota; Diplomate and Member of the American Board of Anesthesiology, Inc.; Member of the Subcommittee on Anesthesia, National Research Council. 771 pages. Illus. Price, \$9.00, cloth. Philadelphia: W. B. Saunders Co., 1942.

MEDICAL PARASITOLOGY. James T. Culbertson, Asst. Professor of Bacteriology, College of Physicians and Surgeons, Columbia University. 285 pages. Illus. Price, \$4.25, cloth. New York: Columbia University Press, 1942.

SULFANILAMIDE AND RELATED COMPOUNDS IN GENERAL PRACTICE. Second Edition. Wesley W. Spink, M.D., F.A.C.P. Associate Professor of Medicine, University of Minnesota Medical School. 374 pages. Price, \$3.00, cloth. Chicago: Year Book Publishers, 1942.

METHODS OF TREATMENT. Logan Clendening, M.D. Clinical Professor of Medicine, Medical Department of the University of Kansas; Attending Physician, University of Kansas Hospitals, and Edward H. Hashinger, A.B., M.D. Clinical Professor of Medicine, Medical Department of the University of Kansas; Attending Physician, University of Kansas Hospitals; Attending Physician, St. Luke's Hospital, Kansas City, Mo. Seventh Edition. Pp. 997. Cloth. Price \$10.00. St. Louis: The C. V. Mosby Company, 1941.

This seventh edition of Dr. Logan Clendening's Method of Treatment (first published in 1924) features the collaboration of Dr. Edward H. Hashinger. Some new sections and chapters, dealing with newer developments in chemotherapy, in deficiency states, etc., have been added. Other chapters have been entirely rewritten, and drug therapy has been brought up to date in conformity with the Eleventh Edition of the U. S. Pharmacopoeia. Otherwise the treatise follows the general plan of Dr. Clendening's previous editions.

The work is essentially a comprehensive outline of accepted therapy and procedures, with succinct directions for their technical accomplishment. The illustrations of technique are simple and clear, in the same manner in which the descriptive text is direct and brief. The text is replete with numerous practical observations and suggestions gleaned from the wide experience of the authors. The book is not designed as a complete medical text; however, in the opinion of the reviewer, it serves admirably as a ready, concise and practical therapeutic reference.

PHILIP F. ECKMAN, M.D.

Effective, Convenient and Economical

THE effectiveness of Mercurochrome has been demonstrated by twenty years' extensive clinical use.

For the convenience of physicians Mercurochrome is supplied in four forms—Aqueous Solution for the treatment of wounds, Surgical Solution for preoperative skin disinfection, Tablets and Powder from which solutions of any desired concentration may readily be prepared.

Mercurochrome

(H. W. & D. Brand of dibrom-oxymercuri-fluorescein-sodium)

is economical because solutions may be dispensed at low cost. Stock solutions keep indefinitely.

Mercurochrome is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

HARDRx Prescription lenses are for general use and are tempered for increased margin of safety against breakage.

BENSAF Prescription Safety lenses are of heavier construction and hardened for industrial and hazardous sports wear.

Both are of highest quality and are case hardened by a controlled heat treatment. Each HardRx lens is subjected to impact of $\frac{1}{2}$ " steel ball dropped one meter and Bensafe lens to $\frac{3}{4}$ " steel ball dropped one meter.

FOR NERVOUS DISORDERS

Operated In Connection

with

Homewood Hospital

Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.

A bid for closer patient cooperation in adjustments of smoking hygiene

THE pace of modern life leaves its mark on many individuals. Symptoms, though remote, sub-clinical, may be of interest to the physician, perhaps in connection with nicotine intake.* Obviously, the exploration of this potential requires the patient's close cooperation.

In this situation there is an advantage to you in advising slow-burning Camel cigarettes. Millions have changed to Camels for their superior mildness and flavor—the famous Camel “pleasure factor.”

Patient's compliance with your suggestions should lead to improved accuracy in case histories. This may present new clinical opportunities, especially when such records are grouped and studied as a whole.

COSTLIER TOBACCOS

Lessons from Pearl Harbor

Destruction of barracks at Wheeler Field, T. H., December 7, 1941.
Photo by U. S. Army Signal Corps.

OUT of the chaos and confusion—the burns, lacerated wounds and compound fractures—that was Pearl Harbor on that first Sunday of December, 1941—have come many lessons. Not the least among them is the value of the sulfonamides—used topically for the management of the potentially infected traumata.

Field conditions were ideal for the production of Clostridial infections—yet the incidence of gas gangrene was remarkably low and resulted in no deaths. Hospital facilities and surgical skill were hard-pressed and surgical operations were delayed from hours to days. Due in no small measure to the use of the sulfonamides, postoperative mortality was only 3.8 per cent, and most of these fatalities were from shock and hemorrhage.

Topical use of sulfonamides is assuming increasing importance not alone in military prac-

tice but in industry and civil life. These compounds should be regarded as an important adjunct to surgery, regardless of whether the surgeon is dealing with grossly contaminated wounds or maintaining asepsis in his operative field. Further studies must, of course, be made to determine the method of application best suited for each type of wound.

The Squibb Laboratories have available many of the sulfonamide compounds. There are several dosage forms under laboratory and clinical investigation and these will be provided as the need arises and results prove favorable.

REPORTS FROM ENGLAND CITE THREE DISABILITIES AMONG FATIGUED WAR-WORKERS

Spencer Sacroiliac Support
for Men

1. ENTEROPTOSIS
WITH SYMPTOMS
2. SACROILIAC SPRAIN
(Other Back Injuries)
3. HERNIA

This probably explains why we are receiving here a greatly increased number of prescriptions for supports for these same conditions.

When you augment your treatment of *Enteroptosis with Symptoms* by a Spencer, the support you prescribe is individually designed for the patient to help return abdominal organs to optimal functioning position—and to improve posture. Frequently an immediate improvement in general health and mental outlook is noted.

For inoperable *Hernia*, a Spencer is especially created for the patient to gently, but firmly, support the hernia,

Spencer Abdominal Support-
ing Belt for Women

while guiding the body to better posture. Spencer Hernia Supports will not yield under strain or move out of place. They are comfortable, lightweight, flexible, easily laundered, durable, with no hard rubber or metal parts.

For *Sacroiliac Sprain*, a special posture-corrective support is designed for the patient, in which is incorporated a simple band which encircles the pelvic girdle, immobilizing the affected joints. Usually prompt relief is experienced.

Every Spencer Support is individually designed for the patient, of *non-elastic* material. Hence, the support it provides is *constant*, and the Spencer can be—and IS—guaranteed NEVER to lose its shape. Spencer Supports have never been made to *stretch to fit*; they have always been *designed to fit*. Why prescribe a support that soon loses its shape and becomes useless before worn out? Spencers are light, flexible, durable, easily laundered.

For service, look in telephone book under "Spencer Corsetiere" or write direct to us.

While it is impossible to list all of the stocked items, a partial listing can be found in your copy of the P & H catalog. For fast, thorough service be sure to use this catalog as your drug buying guide.

PHYSICIANS and HOSPITALS SUPPLY COMPANY, Inc.

"Peace On Earth, Good Will Toward Men"

It may seem ironical to quote those familiar words at a time when the earth is ablaze with war; yet implicit in their beauty is the very essence of that for which we are fighting . . . This war is not of our making, not of our choosing. We are in it because the principles in which we believe are threatened with annihilation, and because deep down in our national conscience we know that our way of life, for all its shortcomings, is the practical as well as the idealistic approach to "Peace on Earth, Good Will Toward Men" . . . There are cynics who argue that there will always be war, that it is man's nature to fight man; but their reasoning is specious. Had Ehrlich, for instance, lacked the faith and incentive to persevere, had he been discouraged by six hundred and five unsuccessful experiments, 606 might never have been discovered and the chances are that one of man's greatest scourges would still be uncontrollable . . . In our great struggle, we of the United Nations derive strength and courage from a sublime faith in our cause. Our conscience is clear and unafraid. In the laboratory of World Events we are using all of our spiritual and physical resources to discover the formula that once and for all will put an end to the scourge of war. Please God, at this Yuletide, that we may soon find that formula through Victory, so that our children and their children and the generations to come may know the full glory and meaning of "Peace on Earth, Good Will Toward Men."

WARTIME PROBLEMS IN INDUSTRIAL HEALTH

CARL M. PETERSON, M.D.

Secretary, Council on Industrial Health, American Medical Association
Chicago, Illinois

CERTAINLY no one factor about modern warfare has so impressed everyone of us as its dependence on industrial production. There is great and justifiable concern about our resources in materials, machines and manpower. As a matter of fact, our greatest shortage of all is *time*. It is now regarded as axiomatic that no modern military power can afford to lose the productive energy of skilled and capable craftsmen from exposures unfavorable to health which in the main are preventable. In the course of current events, it is becoming plainer daily that the unprecedented mobilization of everything we possess must include intensification of industrial health effort.

The wartime problems of medicine in industry are not so much the acquisition of new information as wider and more direct application of what we already know. Industrial hygienists believe that the medical and engineering profession have accumulated sufficient data and have in their possession equipment and knowledge of technical procedure to control all but the very newest occupational exposures or the very latest modifications of old ones. To be sure, research is a highly essential factor in the prosecution of wartime industrial health activity to such an extent that a considerable share of the total activities of such agencies as the Division of Industrial Hygiene of the National Institute of Health and many committees set up in the National Research Council is directly applicable to the physical welfare of workers. The Subcommittee on Industrial Health and Medicine of the Federal

Security Agency has listed certain problems as of particular significance, as, for example, the intensified occupational dermatoses problems associated with the increased use of cutting oils, compounds and chemicals; the appearance of new abrasives in grinding operations; the reversion to sand in many blasting operations; the enormous expansion in the use of acids in pickling operations and solvents of almost uncounted numbers and uses; the employment of x-rays in line operations; modifications in paint spraying methods and many other types of exposures which can be exceedingly troublesome if proper control measures are not utilized. All of us are familiar with the risks of munitions manufacture and production of war gases. Certainly, one of the most perplexing problems facing industry at the moment is the shifting nature of the work force resulting from the dislocation of young males to the military establishments requiring replacement by women, older men, substandard workers of various types including handicapped individuals or others not eligible for military service, practically all of whom require selective placement in occupations suitable to their physical and temperamental makeups.

But in the main, the principal industrial problems which confront the medical profession over and above those which have to do with improved standards of medical and surgical care, are those involved in the wider application of preventive medicine and surgery in industry and the much more extensive and improved industrial health supervision by physicians in plants of all kinds and sizes. The directions in which we are likely

Presented at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1942.

to find a solution to these complex situations may possibly be best illustrated as follows:

About a year and a half ago the director of the bureau of industrial hygiene in one of our state health departments asked the personnel manager of a good-sized machine tool company to maintain sickness records as a means of analyzing the causes of employe absenteeism. The plant was most coöperative and after careful study the conclusion was reached that considerable sums in lost wages and in shop production could be saved if more adequate industrial health supervision could be provided for the plant personnel. In the course of events a full-time industrial physician and three full-time industrial nurses were employed to supply this type of service to approximately 2,500 workers.

This procedure aroused interest elsewhere in the same industrial community and other smaller plants were impressed with the contribution which medical service could make in lowering lost time absences arising out of causes related to health. Since these plants felt unable individually to support a full-time physician, the local medical profession was consulted. It was suggested that individual practicing physicians might meet these new medical requirements if a basis agreeable to the employer and to the doctors could be arranged. After full discussion a rotating scheme for personal visitation by physicians to the plants was hit upon, such visits to occur daily, to last at least an hour, and to occur at a definite time of day, usually in the morning. It is interesting to report that frequently these physicians have become interested enough so that they spend more time than is actually required. The manner of rotation and all other medical policies, including compensation, are made by the local profession and recommendations sent directly to the personnel managers. All physicians in the community can participate if they care to, and nearly all of them do.

This experience compresses into one compact case history a number of very important considerations—

1. It exemplifies the growing recognition by industrialists of the value of industrial health service. We have something they can use provided a method is devised which the employer can comfortably support.

2. It supplies an answer, at least in part, to the vexing question of how industrial health can be brought to the small plant.

3. It dramatizes the immensely improved relationships which are rapidly coming to exist everywhere between the three major classification of physicians on whom industrial medical activity largely rests:

- (a) The industrial hygienist, commonly associated with bureaus of industrial hygiene in state health departments, whose functions are mainly investigative or consultative directly to industry and to the medical profession as well as certain duties in relation to enforcement of public health and sanitary codes relating to conditions of work. Prevention of industrial disability, whatever form it takes, occupies a prominent place in his thinking.
- (b) The full-time physician serving in one or several plants who exemplifies specialty practice in this field. He is concerned very materially with prevention in all of its aspects but in addition he must treat compensable disability and occupy himself with the many details of medical department administration.
- (c) The private practitioner in general or special practice who serves on call or part time. Best current estimates indicate that 80 to 85 per cent of medical service to industry is supplied in this fashion. As such it has been mainly remedial in character to such an extent that medium-sized and smaller plants have been left without the considerable advantages of preventive industrial medicine and surgery.

Objectives and Program

The ability of the private practitioner to extend his interests in the industrial field and to face new problems and altered relationships has engaged the complete attention of the Council on Industrial Health for many months, both singly and in combination with the Subcommittee on Industrial Health and Medicine of the Health and Medical Committee, Federal Security Agency. From the very outset the Council became convinced that its educational and other services could only be made effective through wholehearted coöperation with each state medical society. We have been in close touch with developments in the Minnesota State Medical Association through its own Committee on Industrial Hygiene and Occupational Diseases under the chairmanship of Dr. J. L. McLeod of Grand Rapids. I am thoroughly convinced that as the full implications unfold, no committee in your state association structure will be called upon to provide a higher type of leadership or will contribute more to existing medical standards or to the advancement of sound professional relationships. It now becomes desirable and even imperative to extend this same type of coöperative

organization into counties to enable our membership to respond to the medical needs of industry occurring in their own individual communities.

What kind of program do we have in mind? In the first place, we must agree upon objectives. The purpose of medicine in industry is to promote the health and physical well being of industrial employees. These objectives should be accomplished by:

1. Prevention of disease or injury in industry by establishing proper medical supervision over industrial materials, processes, environments and workers.
2. Health conservation of workers through physical supervision and education.
3. Medical and surgical care to restore health and earning capacity as promptly as possible following industrial accident or disease.

Certainly no new principle is enunciated in this list of objectives but it does provide a foundation on which the superstructure of specific functions in industrial medicine can rest and can be so regarded with confidence by all elements in the medical profession.

In the second place, we must define a little more in detail the medical needs of industry in terms of personnel and specific functions which will bring to plants both large and small good medical supervision, satisfactory both to those who receive as well as those who supply these services. All existing plans contain the following essential components:

For every plant:

1. A physician.
2. Nursing service.
3. Industrial hygiene service.
4. Proper correlation of plant health activities with:
 - (a) The practicing profession.
 - (b) The industrial commission.
 - (c) Units of local, county and state health departments.
5. A health program to include:
 - (a) Health conservation by physical supervision and education.
 - (b) Plant inspections to establish control over harmful exposures.
 - (c) First aid and emergency care.
 - (d) Proper reporting of all lost time disability.
6. Adequate compensation of industrial health personnel.

As this ideal goal is reached (and enormous impetus is accumulating under the pressure of war industry and in the expressions of influential people in the government, in industry, and in

labor) we can begin to feel that the quality of industrial health supervision is approaching reasonable uniformity—the quality only varying according to size of the plant. To hasten this end, the Council on Industrial Health has issued a series of pamphlets descriptive of Medical Service in Industry which includes such titles as—

1. *Outline of Procedure for Physicians in Industry.* This is designed to acquaint the practicing physician with duties and relationships in industry—a most helpful and useful statement.

2. *The Industrial Medical Department.* A brief description of how to go about setting up a plant dispensary.

3. *Plant Hygiene Studies.* This emphasizes that no physician will make a real contribution unless he gets out in the plant and makes instructive suggestions about the prevention of harmful exposures, using necessary industrial hygiene consultation and study whenever necessary.

All these publications and others on various aspects of industrial health are available on request from the Council office in Chicago or through your own state committee organization.

Procurement

Now that we have defined specific needs and objectives in industrial health, we come to the most serious problem of all—the procurement of professional and technical personnel sufficient in number and in competence to supply these services about which we have been talking. There are three main aspects:

1. Shall existing industrial-medical services be maintained as essential to the war effort?
2. From what sources may we expect to draw additions and replacements to our present industrial medical organizations?
3. What provision is necessary to arrange for the training of new recruits?

Plans are on foot to clarify the status of the industrial physician. He is always ranked high in the essential civilian medical services along with members of hospital staffs and faculties of medical schools. Instructions are being prepared by the Procurement and Assignment Service with the help of its Advisory Committee on Industrial Health and Medicine, so that the state procurement and assignment committees will be able to refer to explicit instructions about maintenance of industrial physicians at existing assignments. Evidently also these same state procurement and

assignment committees will function more and more as placement centers for new untrained medical personnel needed in war industry.

The most difficult problem to solve has been the matter of providing the proper training. A few professional schools have developed advanced training courses and there has been some effort to provide continuation study under existing postgraduate programs in state medical societies. The greatest success has been encountered where there has been concomitant training of physicians and industrialists together in the benefits to be derived from industrial health activity. The "Outline of Procedure for Physicians in Industry" will act as an immediately available guide to all ordinary duties and relationships. For more extended training both before and after graduation, the Council on Industrial Health and the Committee on Education of the American Association of Industrial Physicians and Surgeons have prepared a report entitled, "The Teaching of Industrial Health," which we will be glad to supply either directly or through application to your own state society committee.

Conclusion

In the last analysis, a considerable share of the problems in industrial health boil down to these three:

1. Is this environment a safe and healthful place in which to work?
2. Is this worker properly equipped physically and temperamentally for the work he is doing or

for which he is applying, and if not how can he be fitted to perform it?

3. Is this physician properly equipped to recognize and control forms of disability most likely to occur in plants or in occupational groups under his supervision?

In each of these fields attempts are being made to apply the techniques of standardization and certification. Plants are already being inspected for hazards to health and safety. Industrial medical departments are being approved as fulfilling certain minimum standards. In keeping with the times, it is proposed that physicians limiting practice to industrial medical affairs demonstrate their qualifications as specialists before a certifying board.

These prospects, whatever else may be said about them, indicate that industrial health is a province in medicine of great vitality and with most interesting potentialities. Many of its important aspects which only physicians are equipped to perform are virtually unexplored. Here, perhaps, is one of the few remaining opportunities for the extension of needed medical service on the basis of personal initiative by individual physicians. Again, developments which have already occurred may be the spearhead leading to nationalization of certain forms of medical service. In any event, the highest type of medical leadership and diplomacy is needed to see that the essential interests of the worker, the employer and the physician are properly understood and intelligently safeguarded.

MINNESOTA'S INDUSTRIAL HEALTH PROGRAM

L. W. FOKER, M.D.

Director of the Division of Industrial Health
Minnesota Department of Health
Minneapolis, Minnesota

THIS is the first meeting of the Association since the establishment of a Division of Industrial Health in the State Health Department. We hear a great deal at this time of the importance of protecting the health of the industrial worker, "the man behind the man behind the gun," and for this reason this is probably an opportune time to introduce this new activity.

We should not be led to feel, however, that the importance of the activity hinges upon the war effort, or that this State, because of the war, is enjoying a position of industrial importance which will soon collapse following the cessation of hostilities. On the contrary, figures from the 1930 Census show that upon the basis of the number of persons employed in the mineral, manufacturing, and mechanical industries, Minnesota with 210,299 employes ranks twenty-

Presented at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1942.

second among the States. This position is not as low relatively as it may appear, since Minnesota has only 32,000 fewer employed in the above mentioned groups than the state occupying fifteenth place. In other words, Minnesota ranks practically among the upper third of states according to the number of persons employed in mineral, manufacturing, and mechanical industries. Connecticut, a state commonly regarded as of much greater industrial importance, employs only 50 per cent more persons in these industries. The war then has helped focus upon this problem the attention which it deserves.

I do not believe there are many of us who appreciate the extent of the problem of protecting the health of the industrial worker. I have here some astounding figures which were presented several weeks ago by Paul V. McNutt in a talk before the National Conference of Governmental Industrial Hygienists in Washington, D. C. He has shown that on an average, four hundred million working days are lost each year due to disease and injury in industry, by far the greatest part of which is due to disease. The implication for the war effort of these astronomical figures is impressive: if all the disabling illness and accidents struck tomorrow in our war industries, we would have to cease production for sixty-six days.

We should emphasize here that we should not consider the problem as the protection of industrial workers against only the specific occupational diseases attendant with certain industries, but against illness due to all causes. There is evidence that the morbidity and mortality rates of certain industrial groups are higher than in the general adult population or than in the industrial population as a whole. Studies conducted in a number of industries have shown a high incidence of certain diseases commonly considered as nonoccupational, such as tuberculosis, pneumonia, and the degenerative diseases. While it is true that much of the disease among wage earners is due to harmful dusts, vapors, fumes, chemicals, excessive temperatures, and faulty plant sanitation, yet we cannot disregard the effects of improper living conditions, hurry, strain, malnutrition, and communicable diseases.

Governmental and other agencies have recognized for some time the importance of the effects of industrial environment on the health of the worker and on the community as a whole. Soon

after World War I, the U. S. Public Health Service formed its Division of Industrial Hygiene; since that time thirty-six states, four cities, and two counties have formed industrial hygiene units.

Industrial management has been stimulated to join the movement for the protection of industrial health by the growing recognition of its responsibility to protect the health of its workers, through the passage of workmen's compensation acts, and by the realization that among industrial workers, illness, much of which is preventable, causes at least fifteen times as much absenteeism as do industrial injuries. It has been estimated that the total cost of sickness in industry for the United States is five billion dollars annually.

The National Manufacturers Association has shown in a survey of 2,064 plants that by the provision of proper plant medical services and the application of preventive medicine, industrial absenteeism can be reduced 29.7 per cent. Other very significant savings which should be mentioned here are a reduction in the specific occupational diseases of 62.8 per cent; compensation insurance premiums are reduced 28.8 per cent, and labor turnover 27.3 per cent.

The medical profession has not been unaware of the importance of the protection of the health of the wage earner. In 1937, the Council on Industrial Health of the American Medical Association was established and many committees on industrial health have been formed in state and county medical associations. Physicians have begun to appreciate the opportunities in ethically managed industrial health programs and the mutual benefit to be derived from proper relationships between industrial and private practitioners. The private practitioner also is beginning to appreciate his opportunities among the 85 per cent of the industrial workers who are without the benefit of plant medical programs.

In Minnesota, in 1940, the Committee on Industrial Health and Occupational Diseases was formed in the State Medical Association. In 1939 the Minnesota State Legislature passed an act requiring the reporting of occupational diseases and authorizing the State Department of Health to investigate and make recommendations for the control of industrial health hazards. Early in 1940 an Industrial Hygiene Unit was formed within the State Department of Health to carry out this function. In July, 1941, the status of the

Industrial Hygiene Unit was changed to that of a full Division of Industrial Health.

The general function of the Division is to offer a medical and engineering advisory service to assist industry in the many technical aspects of the control of industrial health hazards. The broad outline of its program is as follows:

1. To receive and investigate reports of occupational disease.

2. To promote more adequate medical services within industry, such as the employment of full-time or part-time physicians and nurses, the provision of properly equipped first aid rooms, and the maintenance of sickness records.

3. To encourage the use of ethical pre-employment and periodic physical examinations.

4. To confer with industrial physicians in regard to special problems or general industrial health programs. Special blood and urine analyses for evidence of industrial intoxication will be made when warranted.

5. To provide engineering personnel who are specially trained and equipped to make studies of plant environment (*e.g.*, air analysis for toxic

vapors, gases, and dust, in an effort to determine whether the working atmosphere is safe or otherwise) and to make recommendations for the control of health hazards found. These studies will be made at the request of physicians, plant managements, the State Department of Labor and Industry, and others concerned with the health and welfare of the industrial worker.

6. To promote within industrial groups adult hygiene programs, such as the control of tuberculosis, syphilis, and other communicable or preventable diseases.

7. To prepare and disseminate information on various toxic materials and processes, and methods for their control.

Much of the success of this program depends upon the coöperation of the members of this Association. One means by which the members of the Association can coöperate most effectively is the reporting of occupational diseases, using the reporting blanks which have been recently furnished for this purpose. Obviously, these reports are important in pointing out conditions in industry which are hazardous to health, conditions in the control of which we may be of assistance.

PREVENTION AND TREATMENT OF HEAT COLLAPSE AMONG INDUSTRIAL WORKERS

F. J. ELIAS, M.D.
Duluth, Minnesota

DISABILITY as a result of increased environmental temperature is of special interest to us at the present time. Our war effort demands every consideration toward the reduction in loss of time through accidents and preventable disease; conservation of health and increased efficiency are paramount. This may not be a new hazard to our armed forces but it is certain many of our troops are now being seasoned in far-off tropics. Review of the literature on heat injuries reveals many early contributions emanating from the territories to which our troops are moving, many over the period of only a few days.

It is important to recognize that excessive heat exposure is responsible for three typical maladies: one producing an expression as vivid as any emergency one may encounter in industrial practice known as heat cramps; another, a highly

fatal condition, heat stroke, differing distinctly from the preceding condition. The third, heat exhaustion, manifests also an individual picture with a separate physiologic basis.

Briefly, these disabilities are due to a disturbance in the mechanism of heat production and heat loss, or control of body temperature. Heat production has its source, mainly, in the skeletal muscles of the body and is derived from the oxidation in the tissues. Heat loss is accounted for: 75 per cent through conduction and radiation and 25 per cent through evaporation from the lungs and skin. When environmental temperature approximates or exceeds the temperature of the body, conduction and radiation lose their rôle, the load being transferred to evaporation from the skin.

The total amount of salt in the human body is estimated to be about 150 grams; the daily in-

¹Presented before the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July, 1942.

take is from 8 to 12 grams. As much as twenty-five per cent of the latter may be lost in an hour under certain conditions. The important property of salt, especially the sodium ion, is in the osmotic regulation of the body fluids and juices. Of interest to us is the behavior of body water. The kidneys maintain an equilibrium of salt in the body even with the ingestion of large quantities of water. The sweat glands fail to suppress the excretion of salt in perspiration and considerable depletion occurs with excessive activity. With the abnormal loss of salt and coincident ingestion of large quantities of water, normal tissue fluids are replaced by fluid of different concentration. This is constantly associated with heat cramps, to a less degree in heat exhaustion and is absent in heat stroke.

Heat cramps occur in the early period of a hot spell, do not produce unconsciousness and follow extreme activity with profuse sweating and increased ingestion of fluids. The body temperature is normal. The most prominent symptom is a spasm of groups of muscles, subsiding for a period to recur with varying degree and frequency. The muscles of the extremities are the most frequently involved. Subjects indicate the pain as indescribably intense. In the severe case, the relief observed in replacement of salt through intravenous injection is striking. The milder cases require only oral administration. Patients are usually relieved after twelve to twenty-four hours.

Heat exhaustion presents a picture of shock and weakness. The individual is pale; the skin cold. The pulse is usually weak and rapid; the temperature is below normal. It is more frequent in the older age group and those handicapped by systemic disease.

Patients with heat stroke manifest a high temperature, 106 and above, unconsciousness and a dry skin. There is absence of sweating and its cessation occurs before the onset of an attack.

Its occurrence is more frequent after the second and third day of a hot spell. No loss of chlorides is noted, its basis being a disturbance of the heat regulatory center. This condition is the most serious of the three and demands prompt measures toward the reduction of body temperature.

In general, the measures conducive to a good industrial health program include the prevention of heat collapse in the industrial worker. The periodic physical examination, including that after sick absenteeism and prompt report of illness on the job, needs greater attention during this season. Dietary indiscretion and alcoholism are frequently observed as factors in the incidence of heat exhaustion and heat stroke. Careful attention should be given by the employe to the meal carried to work in the lunch kit. Too frequently it contains food remnants inadequately stored or refrigerated. Education in the selection and preparation of this important meal has broad possibilities in the hygienic program. Adequate rest, often obtained with difficulty, during protracted periods of hot weather, should receive consideration.

Sufficient experience in the use of salt in the prophylaxis against heat cramps in recent years has proven its value. The use of the tablet is the most practical method of administration under most circumstances. The coated tablet appears to meet with more favor. In the treatment of heat exhaustion, facilities should be available where adequate examination and observation may be carried out.

Of major importance in the management and control of this serious disability is the necessity for a sound industrial health program under the supervision of an efficient and well-organized medical service.

Appreciation is extended to the Industrial Relations Department of the Carnegie-Illinois Steel Company for the presentation of their interesting sound film on "Beat the Heat."

POLIO INCUBATION PERIOD AVERAGES TWELVE TO THIRTEEN DAYS

Infantile paralysis takes from twelve to thirteen days, on the average, to develop after a child has been exposed to the disease, Dr. Albert E. Casey, of Birmingham, Ala., reports (*Jour. AMA*, Nov. 14).

This period, known scientifically as the incubation period, varied from five to thirty-five days in the thirty-seven cases Dr. Casey studied. The twelve-thirteen day incubation period is compatible, he reports, with that in eleven cases reported in medical literature and with the incubation period in monkeys or chimpanzees inoculated with freshly isolated human strains of the infantile paralysis virus.—*Science News Letter*, November 21, 1942.

DIET AND MUSCULAR FATIGUE

AUSTIN F. HENSCHEL
Minneapolis, Minnesota

IT is common knowledge that in order to do work one must eat. In total starvation muscular efficiency and work capacity fall continuously. Food is the source of the energy for work. We must admit, however, that our detailed knowledge of the function of many foods is scanty. Most everyone will agree that certain classes of foodstuffs—as glucose, amino acids, fatty acids, minerals, vitamins, and water—are absolutely necessary for normal metabolism. But what effect does maximal or minimal daily intake of the various dietary constituents have on the human ability to do muscular work? Can one do more work or prevent the onset of muscular fatigue by following any special dietary regime? Scientists have long known that carbohydrates—specifically glucose—play a major role in muscle metabolism. It was recognized that tiredness, fatigue, and, in extreme cases, even collapse occurred when the blood sugar was depleted. Men kept on a low carbohydrate diet soon exhibited decreased muscular efficiency and ability to do hard physical work.²⁴ In experiments on the efficiency of industrial workers^{11,12,13,14} it was found that when the blood sugar was low, the muscular efficiency—and consequently the output—of the workers decreased. When the blood sugar and muscular efficiency of the workers had fallen to fasting levels, as they were found to do within three hours after the last meal, the ingestion of 30 grams of glucose or 225 c.c. of fruit juice raised the blood sugar 75 per cent and the muscular efficiency 25 per cent. From this evidence it appears justifiable to conclude that the total amount of work and the efficiency with which one can do it are decreased when the blood sugar falls below some optimal value. There is, however, no evidence that in normal humans fatigue can be delayed or decreased by maintaining a superoptimal blood sugar level. One might, also, criticize the results of the experiments on the industrial workers on the basis that it has been shown³⁰ that almost anything one does to change the worker's routine will increase output.

The role of the fats and proteins in work and

fatigue is not firmly established. When men were kept on a high fat diet they were less efficient and fatigued faster. However, this finding may have been related to the relatively lower carbohydrate intake. Protein intakes up to 500 grams per day have been investigated. The subjects were more efficient on the high protein diet than on the high fat diet, but were not as efficient as when the blood sugar was kept at high levels by giving carbohydrates.¹² Numerous papers have appeared on the value of a high glycine diet. Some of the investigators found that work output could be increased up to 200-300 per cent by a daily intake of 10 to 50 grams of glycine.^{1,4,32} In other laboratories the beneficial effects of glycine could not be confirmed.^{15,17,21} Consequently, it remains for the future to show the true importance of the amino acids in muscle metabolism.

Amphetamine sulfate (benzedrine) has been used rather widely to postpone the onset of fatigue and to lessen its symptoms. Research has in part, justified its judicious use. It has been shown that 10 to 20 mg. of benzedrine sulfate given to patients complaining of chronic fatigue markedly improved 80 per cent of them. In a group of 80 normal people 62 per cent of those receiving the drug recorded subjective feelings of decreased fatigue and increased efficiency while only 16 per cent of those receiving placebo recorded any subjective help²⁹. Benzedrine given 3½ hours before the end of the working day increased the flicker fusion frequency and decreased the sense of fatigue in a group of office and laboratory workers³⁴. Doctor Ivy¹⁸ has concluded that the diminution of the sense of fatigue by benzedrine was entirely a subjective phenomena. This might cast some doubt on the ability of benzedrine to influence true muscular fatigue.

The use of coffee, tea, and "cokes" to combat fatigue is a common practice. One might be tempted to think that the popular mid-morning coffee and afternoon tea habit might reflect something a bit more fundamental than accidental habit. Caffeine⁵ has been shown to prolong the onset of fatigue and increase the total work out-

From the Laboratory of Physiological Hygiene, University of Minnesota. Presented at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1942.

put of an isolated frog muscle. In the normal noncoffee drinking human it took from 0.5 to 1.0 gram of caffeine intravenously to produce any subjective or objective effect on fatigue⁹. With such high doses the recovery rate from fatiguing work and the total amount of work that could be done before complete fatigue were increased. If it takes about 1 gram of caffeine intravenously to be effective, it hardly seems logical that the average coffee drinker would get enough caffeine to have any alleviating effect on fatigue.

Of particular interest is the part played by the vitamins—especially ascorbic acid and thiamine—on muscle metabolism. There is no doubt that the vitamins are dietary essentials for maintaining normal muscular activity. The recognition that an increased intake of vitamins will increase the physical vigor of frank vitamin deficiency cases has given rise to the belief that a superabundance of these vitamins may produce supermen or at least help one in meeting physical strain. Research on isolated muscles has led a few investigators to believe that ascorbic acid and thiamine will increase the ability of a normal muscle to do work.^{2, 3, 16, 27} Others, however, were unable to confirm the results.^{20, 33}

Experimentally induced thiamine deficiency in human subjects has produced interesting results. When subjects were kept on a diet adequate in all respects except thiamine (0.5 mg. or less per day) they developed clinical symptoms of thiamine deficiency including muscle soreness, weakness, and a decreased ability to do work^{8, 19, 26, 35, 36, 37}. As the daily thiamine intake was progressively increased a level was attained where the clinical symptoms disappeared and the work capacity was increased. When still higher doses of thiamine were given to these subjects on intakes just sufficient to prevent deficiency symptoms, the amount of work the subjects could do seemed to be further increased. Clinical symptoms disappeared on thiamine intakes of 0.5 mg. per 1,000 calories while maximal benefits were obtained with not more than 1 mg. of thiamine per 1,000 calories. Thiamine intakes of that order fall within the 1.2 to 2.3 mg. per day, suggested by the Committee on Food and Nutrition of the National Research Council.³¹ Food purchase surveys have shown that from 30 to 50 per cent of the American diets would fall into the sub-clinical deficiency class receiving less than 1 mg. thiamine per 1,000 calories.^{6, 7} It would be

expected then that a great many people should be helped physically by an extra thiamine intake. Addition of up to 15 mgs. per day of thiamine to uncontrolled human diets has been reported to improve such muscular performances as holding the breath, arm-holding, cycling, and football playing.^{10, 25, 28} However, the results can be justly questioned because the experiments were poorly controlled.

Doctor Ancel Keys and I^{22, 23} have carefully investigated the possibility of increasing work ability by vitamin supercharging. The subjects were healthy, normal enlisted men of the United States Army who were eating the regular garrison ration. Analysis of the ration showed it to be sufficient in all respects. The thiamine content was not less than 1.7 mgs. per day's ration. Increasing the daily vitamin intake by 17 mgs. of thiamine, 100 mgs. of nicotinic acid amide, 20 mgs. of calcium pantothenate, 10 mgs. of riboflavin, 100 mgs. of pyridoxine, and 200 mgs. of ascorbic acid over periods ranging from 5 to 6 weeks had no effect on the subjects' biochemical and physiological response to a set task of severe work. Each subject was on a control period which was identical to his experimental period except that he was given placebos identical in size, shape, and color to the vitamin tablets. In this way each subject served as his own control so that individual variations were eliminated. The variables measured to assess the effects of the vitamins were pulse rates, heart size, stroke output of the heart, oxygen consumption, respiratory quotient, urinary nitrogen and ketone body excretion, blood glucose, blood lactate, hemoglobin, blood acetone, and two-hour glucose tolerance curves. Except for a slight training effect none of the variables measured were significantly different during the control and the experimental periods. Only one subject expressed any subjective improvement and that happened when he was on the placebos.

The garrison ration contained the suggested optimal thiamine intake, consequently the experiments did not cover the subclinical thiamine deficiency levels which might, according to some other investigators, be benefited by increased thiamine intakes. We have now finished a series of experiments on normal active college men who have been kept on the suboptimal thiamine levels for periods ranging from five to ten weeks. As with the soldiers each subject has served as his

own control. The subjects ate only the basal diet. During half of each experimental period they received extra thiamine and during the other half they got placebos. Thiamine determinations were run on the diet every day and twenty-four-hour urinary thiamine excretions were done each week. One-half day each week each subject was subjected to a standard routine of severe muscular work. Complete blood chemistries were run before and after each work period. The results indicate that the ability to do the set task of work was the same when getting extra thiamine as when on the basal diet alone. No symptoms of deficiency were noted. These experiments indicate that thiamine intakes of more than 0.3 mg. per 1,000 calories of food consumed have no effect on the ability of a normal person to do severe muscular work.

Summary

Although special benefits from special foods have often been suggested for normal humans, there is little evidence that the special benefits are actually obtained.

Extra supplies of vitamins have no influence on physical ability, resistance to fatigue or the rate of recovery from severe muscular work.

The usual dietary constituents are essential for normal muscular activity and physical well-being. However, the optimal intakes of the various foods are not fully established. By following the recommendations of the Committee on Food and Nutrition of the National Research Council, basic food requirements for all normal needs would be amply fulfilled. Even though the recommendations may in some cases exceed the optimal requirements, it is comforting to know that the results of a superoptimal intake are nothing more serious than a waste of money.

Normally humans absorb 70 per cent of the *carotene* in raw carrots or cooked spinach, furnishing them with vitamin A, but this drops to 50 per cent if there is no fat in the diet.

FIRST AID TO THE INJURED WORKMAN

R. F. McGANDY, M.D.
Minneapolis, Minnesota

IT IS gratifying to one who has been associated with industry for some time, to see the increase in interest shown towards the first-aid care of the injured workman. I think the impetus for this has been due in part to the increasing number of lay people who have taken first-aid courses. These courses not only have had an effect in preventing accidents but also have given the layman an appreciation for the care of the injured, which I believe can be obtained in no other way. I think it fitting, therefore, that we as medical people take advantage of this situation so that the care of injured workmen will be improved still further. In the past, this problem has been the concern principally of larger industries. However, the same care can be carried out in small industries where we have some of the workmen trained as first-aiders. Industry has been in a unique position in that it has had an opportunity of controlling the injured workman from the time of the inception of the injury until he is completely healed. This is a situation which does not present itself to men who see injuries in private practice.

First aid always begins by preventing accidents. One of the best ways to prevent accidents is by having a careful physical examination of all employes before they start to work. This examination should be repeated if the employe has had a serious injury or accident. In organizing any first-aid procedure for injured workmen, men should be picked who not only have had first-aid instruction but who have practical ability for taking care of an injured man. In a large plant where an official first-aid station is maintained, probably manned by a graduate nurse or a doctor, this is not necessary. Instructions for first-aiders should be extremely simple, clear-cut and of such a nature that they can be understood by any workman. These instructions can be improved by having illustrations or pictures showing the use of certain equipment, such as bandages, splints and so forth. It may be that the specific instructions of a surgeon for a spe-

cialized type of industry are necessary but in general all instructions should be simple. First-aid kits are essential.

In the electric industry, we have kits to fit each truck where there are small crews. In these kits are bandages and other equipment, most of which have illustrations in the form of pictures showing how the equipment is to be used. I believe a first-aid kit should contain sterile gauze compresses of varying sizes, bandages, splints, and possibly a tourniquet. I think this makes an excellent first-aid kit. Employers and employes alike should realize that the day when the injured workman dashes to the medical kit and pours some iodine or other antiseptic into a wound and then forgets it, has passed.

We should also appreciate that we are not making doctors out of first-aiders. All wounds regardless of size and the embarrassment of the employe sustaining the wound should be reported and taken care of. It is a well-known fact that serious complications more frequently follow small wounds than large wounds. In many industries, men are penalized in some way for not reporting any and every wound. In treating these wounds we should impress on the workman who has received one that nothing should be done which will increase injury in the first-aid care.

This brings up the matter of antiseptics. Koch's influence in the treatment of wounds has changed our methods of procedure quite radically. If doctors as well as laymen would realize that the pouring of any antiseptic into a wound only increases the injury already done, first aid would be improved. Any antiseptic can do just as much injury to the tissue cells as it will to the bacteria. If the tissue cells are destroyed or injured, their natural defense mechanism has been impaired and an excellent medium for the growth of bacteria has been set up. Furthermore, Fredrich has definitely shown that bacteria do not penetrate the tissues for the first six hours. With these facts in mind I do not believe wounds should be treated with any antiseptic by a first-aid-er. I feel that the proper thing to do for

Presented at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1942.

such wounds is to cover them with a sterile compress holding it in place by some form of bandage and get the patient to the doctor or hospital as soon as possible. I do not believe the first-aider should go so far as to clean dirt, grease or debris off a wound before applying sterile gauze. This just increases the trauma and therefore increases the possibility of further damage to the wound. In general, the dressing used for the wound should be large enough to more than cover it, the tendency of most workmen being to apply too small a dressing to a wound. Further than this we need not worry about anything except the control of hemorrhage as a first-aid procedure.

This brings up the fact that most surgeons realize that the tourniquet does more damage than good in the hands of the average first-aider. I certainly heartily agree with this fact. I think it should be impressed on first-aiders that hemorrhage in general from wounds can be controlled by pressure of the bandage over the sterile gauze compress on the wound in most cases. Rarely will a tourniquet have to be used. If a tourniquet is used, I think it should be used with the same materials and at the points designated in the *First-aid Manual* put out by the Red Cross, for the sake of uniformity. Most of the damage done in the late war by tourniquets was because of the long time which they were applied. This is obviated in industry because of the proximity of the patient to the doctor or a hospital in this state.

I do not feel as a first-aid procedure that foreign bodies in the eye should be removed at the site of an accident by an employee. In this situation, I feel the eye should be properly covered and the patient taken to a physician.

In the first-aid treatment of burns, we must remember that they are wounds just the same as any other wound. It is my policy in extensive burns to minimize the first-aid treatment as follows: the patient should be covered by a sheet or blanket, kept warm, recumbent and transported to a hospital as soon as possible. In other words, I do not believe the shock should be increased in any way by a layman attempting to apply some ointment or liquid to a burn. In the majority of cases, they would not have enough material to cover the burn and in the next place the doctor as a rule has his own definite ideas about the care of specific types of burns. If the burn is

small I believe it should be properly covered by a sterile dressing like any other wound. In no case do I feel any ointment or other material should be applied to the burn by a first-aider. This might be changed in cases where a dressing room manned by a nurse is established at the industry. It must be remembered that a covering over a burn will minimize pain to a great extent. In some severe burns, the doctor may have to be called to administer an opiate before the patient is moved.

Artificial respiration is an extremely important first-aid procedure in industry where asphyxiation is possible. I believe the prone pressure method described in the Red Cross *First-aid Manual* is the best procedure because of its simplicity and the fact that no equipment is required. All employees should practice this frequently, particularly in the electric and gas industry. More recently in the electric industry, we are teaching what is known as pole-top resuscitation. This is a procedure which can be carried out at the top of a pole where many of our electric accidents occur. The results have been extremely gratifying because there is little time lost between cessation of breathing and artificial respiration. The prone pressure method in the same accident could not be started until the patient reached the ground, which is a matter of at least three minutes.

Considering fractures, from a first-aid standpoint, I wish to call your attention to the work done by the Fracture Committee of the Minnesota Medical Association, which was reported in the November issue of the MINNESOTA MEDICINE for 1941. I do not believe that there is any deviation from the opinion that fractures should be splinted where they lie and before they are moved. Where a First-aid Station is manned by a doctor or a nurse this is simplified. The problem is how best to teach this to first-aiders, in the case of smaller industries. If we combine what is given in the *First-Aid Manual* put out by the Red Cross, plus the changes made by the Committee from the Army, Navy and American College of Surgeons, I think we can arrive at a few simple rules. All individuals with skull fracture and head injuries should, of course, be transported lying flat on their back. The same applies to the cervical spine; whereas, those with fractures of the thoracic and lumbar

spines should be transported on their belly. In the case of neck fractures proper support should be given to the head. This is a very simple and definite rule and I do not believe it should be changed. First-aiders should furthermore be impressed with the fact that those with head injuries or fractures of the spine should not be set upright or jack-knifed in the back seat of a car. If they understand the reason for this, first aid will be improved. Fractures of the upper extremities, I feel in most cases, can be taken care of by some simple padded splint, such as a board or metal splint and the use of a sling. The Navy apparently took exception to the use of the full-ring hinged splint for fractures of the arm. They believe that in fractures of the humerus the arm should be placed in a sling and let gravity take care of the fragments where the victim can sit up or stand. I do believe, however, that in civilian practice, there is no danger from the pressure of a full-ring splint where the distances to the hospital, as I have stated before, are short. Fractures of the lower extremities are best taken care of without question in a half-ring hinged splint. Fractures of the ankle and foot in my

opinion are best immobilized by the use of a pillow splint.

In connection with the ring splints, as mentioned above, I wish to call your attention to the fact that due to the efforts of Dr. Webb and his Committee, an ordinance has been passed in Minneapolis whereby the ring splints for both the upper and lower extremities are carried in all ambulances. The ambulance not only must have the splint but the ambulance attendant must be able to apply it before he is able to obtain a license to operate an ambulance. This does not make it necessary for the men in Minneapolis to carry splints in their cars. However, I believe it would be a good plan for any doctor dealing in fractures to carry such splints. I would suggest that you read this ordinance which has been recently passed in Minneapolis and possibly use it for a model in your own communities for a similar ordinance.

In conclusion, I wish to state that first aid can be brought to smaller industries by the instruction of lay people provided the rules are simple and instruction is limited to first aid and not treatment.

WHAT THE MEDICAL PROFESSION CAN DO TO INCREASE SAFETY AND HEALTH IN WAR INDUSTRIES

ALBERT N. WOLD

State Safety Consultant

National Committee for the Conservation of Manpower in War Industries

United States Department of Labor

Saint Paul, Minnesota

DOCTOR GEORGE McLEAN is dead. He died the other day at a ripe old age. He died in sunny California—far from the wind-swept prairies of Dakota Territory, where he practiced medicine in the eighties and nineties of the last century.

Through the years I have retained a distinct interest in "Doc Mac"—as he was known far and wide. He officiated at my advent into the world, my immediate world then being a log structure with a sod roof. He also was on hand when my older sisters and brothers came along. It seems that our birthdays were all arranged for the summer and early fall so that the snow-blocked trails of winter would not bog down

Doc's fast-traveling horses. The day came when Dr. George McLean decided to pull up stakes and move elsewhere.

I clearly recall him driving up to our new house one summer's day. He was driving his span of high-stepping bays which were the envy of every lover of horse flesh. Tied to the back of his buggy was his beloved organ—a beautiful solid walnut affair which he had brought on from his native Vermont. He threw the reins to his driver and leapt from the buggy. He was short of stature and purposeful in stride. It could be said of him that, like Napoleon, who he tried to emulate, he would appear to be "strutting while sitting down."

"Nels," he said to my father, "I am moving

Presented before the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, July 1, 1942.

on to new pastures." My father wanted to know why. "Well," he said, unmindful of us children who circled the two men, "these goddam specialists are beginning to crowd me. They have fancy, hifalutin' names for a lot of plain ordinary aches and pains and I'll be damned if I am going to stay around and have my patient's force me to become one of them. I am giving you my organ for your new house and I won't be around to see any more Wolds into the world."

And so, Dr. George McLean moved a hundred miles farther West—where the specialists were unknown. Later on we heard that he had moved still farther West, for the same reason, I suppose. But he gave the organ to my father and he also parted with the one sheet of music he was able to play. On that sheet of music was the picture of the famous Corsican whom he idolized, and the title was "Napoleon's March." Yes, Doc Mac was on the march, constantly on the march. And now he is dead. When he died an era went with him to Valhalla. It was the era of the old-time, horse and buggy, family doctor. The only reason I have for relating this episode out of the past is to enable me to put the question: "Is there a doctor in the house?" Or are you mostly specialists here today?

Today there are a lot of doctors "on the march." They are on the march into the Army, the Navy, the Marine Corps. When the Specialists in Destruction—Hitler, Mussolini and Hirohito—are on the loose, our tremendous armed forces are going to suffer the inevitable ills and injuries of mechanized warfare. In 1940 the Army had 1,200 doctors in service; in this year of 1942 the number will increase to 15,000 and in 1943 it is anticipated that 33,000 doctors will be in Army uniform. The Navy will have 10,000 or more. In 1944 it is expected that 60,000, or one-third of the country's 180,000 doctors, will be in service.

This means that in so-called favored areas each 1,000 civilians will have to get along with not more than three doctors and in rural areas each doctor will find some two thousand civilians on his hands. Under such circumstances there is not going to be a great deal of room for the specialist—every doctor in 1943 and 1944 is going to find himself becoming a family doctor. More and more as we get into this War we will find it becoming a family affair in this country. One or more members of the family will be in the

armed services; one or more members of the family will be engaged in war production work; other members of the family will, because of age or physical conditions, either be attending school or maintaining the home. That is the situation in totally mobilized England; that is the situation we will have to accept here. It is to be assumed that the armed services will have proper and adequate care. Are the remaining doctors going to be able to maintain present health standards on the home front?

Let us see what has happened to the so-called home front in Germany. The health of the German people has been undermined by years of hard work, long hours and malnutrition. The population of Germany is approximately 85,000,000; that of the United States about 133,000,000. Comparative figures for the two countries on three outstanding diseases can be enlightening. The statistics on Germany are from the *Reichsgesundheitsblatt*.

Diphtheria

	Year	Cases	Year	Cases
Germany	1939	128,897	1941	154,752
United States	1940	18,061	1941	15,536

Scarlet Fever

	Year	Cases	Year	Cases
Germany	1939	119,730	1941	226,735
United States	1940	155,464	1941	128,490

Tuberculosis

	Year	Cases	Year	Cases
Germany	1939	69,502	1941	88,312
United States	1940	103,348	1941	106,372

The mortality rate from tuberculosis increased, in Germany, from 81.8 to 104 per 100,000; in the United States it decreased from 44.4 to 42.2.

Looking no farther ahead than the next two years we will find that rationing of fuel may make our homes much colder; rationing of tires and gasoline will, very likely, reduce participation in healthful recreational activities. We have had some rationing of food and may get more restrictions. High prices on clothing are in the offing unless "ceilings" are put into effect. All these factors are going to affect the family health.

The doctor's home front problem of maintaining present health standards will steadily increase as we approach the 100 per cent total mobilization point. Perhaps one of the bigger problems will be that of the mother who is now working in a war production plant and trying to maintain her home on an even keel at the same time.

Two months ago we had some 400 Minnesota plants engaged in war production; today, two months later, the number has increased to over 700. Day by day men and women are leaving accustomed tasks and going to new and untried war work; day by day the percentage of women going into industrial work is growing. The problem of the plant safety engineer is becoming more complicated; the problem of the doctor will become more complicated too as he finds his work steadily veering into industrial ills.

I want to try to give you a word picture of the prodigious war production program in which our country is engaged. The facts are stupendous—but they are facts and not figments of the imagination. Let us take SHIPS. In 1942 and 1943 the program calls for 23,000,000 tons of ships. Not navy ships but merchant ships. And they are being built on schedule—and ahead of schedule. Out on the Pacific Coast one shipbuilder is now turning out a 10,000-ton ship every 46 days. If you were to put the ships we are building in a row you would have a 5,000-ton ship for every mile between Duluth and Moscow—a distance of 4,600 miles!

Let us take anti-aircraft guns. The war production plants of the United States will be rolling out 65,000 of the "ack-acks" this year and next. This means—if you want a visual picture—that you could place an anti-aircraft gun every 13 feet between Duluth and the Twin Cities and have several to spare.

And tanks—armored tanks rolling on rubber caterpillar tracks and bristling with high-powered guns—are now rolling out of the factories at a greatly accelerated rate. This year and next we will turn out 125,000 of them. Not small baby tanks but gigantic tanks which will shudder the earth as they roll along.

Start, if you please, at New Orleans and in Louisiana, where so many of our boys are in training camps and your procession of tanks—with 10 feet between them—will lead up through Arkansas, Missouri, Iowa, Minnesota and up to Winnipeg—a continuous line of rumbling, grum-

bling mammoth tanks from the Gulf of Mexico to the prairie capital of our Canadian ally. Turn these tanks at right angles and they would sweep forward in a solid rank—a tank every 65 feet.

Perhaps the pictures of ships, anti-aircraft guns and tanks—the stupendous job of producing them—hasn't fully impressed you. So let us consider the airplanes we produced in 1941, are turning out in ever-increasing numbers this year, and the production scheduled for next year—1943.

Let us start in New York Harbor—at the base of the Statue of Liberty—and place the planes wing tip to wing tip. You can walk on the wings of the planes and step from one plane to the next and how far do you think your trip will take you? You will pass through New York City—the world's greatest assembly of human beings—on into Pennsylvania—with her vast stretches of coke ovens and blast furnaces turning out munitions of war from the ores of Minnesota. You will pass on into and through Ohio—and you will think of the rubber factories at Akron and the great Curtis-Wright Field at Dayton—and you will think of the Wright brothers as you leave Ohio for Indiana—the home of the great steel plants at Gary—again working on iron ore from Minnesota's great Iron Range. You are still walking on the wings of a solid row of planes as you pass through the great industrial districts of Chicago and Illinois. Have you come to the end? Oh no. The solid row of planes reaches out ahead of you through Missouri through the expansive wheat fields of Kansas, through Colorado and Denver—where ocean-going ships are being built piecemeal and being shipped to the Coast for Assembly. The end is not yet. The solid row goes on and through Utah, through Nevada and on to the great airplane plants of California—where in two plants alone 60,000 workers in each are helping turn out this solid row of planes on which you have crossed the continent. Two hundred thousand planes in 1941, 1942 and 1943. Wing tip to wing tip they would stretch across the entire United States and a hundred miles into the Pacific!

Airplanes can travel by air and ships can travel by sea but the raw materials for the munitions of war have to be shipped by railroad. Over a million workers—hardbitten railroad men—have been so well trained that when the emergency came they were ready. Today the railroads of the country are hauling over one million tons of

freight a mile every minute of the day and night. Within a period of seven weeks following Pearl Harbor 600,000 soldiers were moved—with their guns, armament and war equipment—from the training camps to both coasts. And only one soldier out of the 600,000 lost his life. Every day 16,000 freight trains, containing some 1,700,000 freight cars, are on the move over the 235,000 miles of railroad in this country. Since the last World War the railroads have spent over \$11,000,000,000 improving their equipment and service. The average locomotive pulling power has been increased 43 per cent and locomotive failure is one-seventh of what it was during the last World War. The average freight train speed has been increased 45 per cent and the average freight car capacity has been increased from 42 tons to fifty. At the same time freight car failure has been cut to one-fifth of that in the last World War.

Since the last World War the railroads of the country have set the pace in the reduction of deaths and injuries to their employees. From 1923 to 1940 fatalities were reduced 72 per cent and injuries 88 per cent. In 1941 with the tremendous burden of transporting the munitions of war laid on them the downward trend stopped and reversed itself—an increase over 1940 of 6 per cent in each category was noted. The outstanding example of reduced accident rates despite a great increase in tonnage hauled is that of the Duluth, Missabe and Iron Range of which your chairman, today, Mr. A. V. Rohweder, is safety superintendent. It has a frequency rate of 1.76.

It can be readily understood that one of the critical problems facing industry is the matter of conversion of peacetime industry to a war footing. Hundreds of plants which last year were manufacturing radios, kitchenware, refrigerators, toys, heat-registering devices, clothes pins, etc., are today turning out bomb sights and bombs, cartridges, tanks, rifles and guns, airplanes and small ships. That means new designs, new machinery, new methods. But that is just plant conversion. An equally large problem has been the retraining of old employees and the education and training of new ones. The stenographer of last year is the spotwelder of today; the operator of a small lathe in a toy factory of yesterday is now at the controls of a tremendous press in a shipyard.

The experience of England in converting plants

and manpower to wartime needs is worthy of study. The 1940 annual report of His Majesty's Chief Inspector of Factories gives us some revealing figures. There was a great increase in both fatal and nonfatal accidental injuries. The fatalities increased 7 per cent in 1939 over the figure for 1938; in 1940 the increase was 24 per cent over that for 1939. Nonfatal injuries increased 17 per cent in 1939 over 1938 and 20 per cent in 1940 over 1939. An interesting contrast to this distressing experience was that of plants which had installed efficient accident prevention and health conservation departments. Accidents decreased progressively downward per 100 employees as follows: 1937—0.94; 1938—0.95; 1939—0.75; 1940—0.66. Indications are that more than 40,000 civilians have been killed in England, since the start of the war, by air raids. The increase in industrial accidents and fatalities cannot be attributed to air raids but the ever-present danger of air raids has drastically affected the working methods of British war plants.

Many plants are actually operating in the open in order to avoid the danger of collapsing roofs. These plants cannot be operated at night. Other plants operate with blacked-out windows and doors. This means that the ventilation problem has become a serious one in British industry. Almost every plant is required to maintain bomb shelters for its employees.

Long hours of work began to have inroads on the health of the workers. In plants which operated the clock-around and where employees were permitted to work from seventy-two to eighty-four hours per week absenteeism increased. On any one day from 15 per cent to 25 per cent of the persons employed were absent. Gradually the work week has been reduced to fifty-six hours and absenteeism has become negligible. Time does not permit to go into the travail of Britain's industrial experience—but here are some of the things which industry and medical profession have had to contend with: absence of the mother from her home while at war work; transportation of workers; board and lodging of transferred workers; day nurseries for children of war workers; malnutrition due to inadequate food supplies or to improper preparation of available food. These things are mentioned as signposts for industry, safety engineers and the medical profession in our country.

Many of our workers are now living in trailer

camps. Roads are muddy and grounds are soggy. School facilities are lacking. Sanitation is far below health standards. Taverns, dance halls and "red light" districts adjacent to war production plants have prompted the Government to issue warnings to over 8,500 of these plants. A worker lost to production because of disease, due to these conditions, is as much lost as if he had been seriously injured in an industrial accident. I can merely point to this situation and direct it to the attention of safety engineers and doctors. The doctors of today and tomorrow are going to be fewer in number; they are going to have more to do and less to do with.

In 1941 there were 17,000,00 industrial workers in this country—an increase of approximately 3,000,000 over 1940. The figures for 1942 are not available but the total is in the neighborhood of 20,000,000. The records disclose that the 17,000,000 in 1941 lost an average of nine and one-half days each due to illness and accidents. This amounted to 160,000,000 man days of lost industrial work. On the basis of today's wages in industry here was a loss of wages well in excess of one billion dollars. But, more important than the wage loss was the loss in productive power so necessary to get out the vitally important implements of war.

Safety engineers are concentrating on the job of holding accidents in check. The National Committee for the Conservation of Manpower in War Industries is having its inspectors check all war production plants. Plant after plant has set up safety programs. Here in Minnesota the Committee is working with the State Industrial Commission and the Industrial Division of the State Board of Health.

In the matter of illness of industrial workers we have, however, a long row to hoe. With five to ten million of our citizens going into the various branches of the service and away from the industrial locations, it may be that the doctors will want to concentrate more on industrial workers than they have heretofore.

The first thing the medical profession should do is to make a self-diagnosis. A medical diagnosis may turn up anything. In this case you know what you are looking for. You are trying to find out how much, or how little, you know about industrial health. You have had patients from industrial plants; have you had industrial plants as patients? You have realized, I am sure,

that in your examination of a sick or injured industrial worker that so far as preventive medicine is concerned you would like to take a look at the work environment of the patient. So, do you take a trip out to the worker's place of employment? The record says that you do not. You cure or mend the patient—if he is curable or mendable—and pass on to the next patient. Subconsciously you think that you must find out something about the working condition of plants in your town—some time. Well, some of you have picked up the ball and carried it from that point; most of you have not.

Some day an industrial plant, with an assortment of aches and pains, may want you to diagnose its ills and prescribe a cure: a cure, say, for a condition which produces absenteeism due to illnesses. But your quick self-diagnosis tells you that you are not the "doctor" for this job. You realize that you don't know what it is all about. You do one of two things: you leave the field to the industrial hygienist or the industrial doctor, so called, or you really begin to dig into this business of preventive medicine so far as the industrial workers in your town are concerned.

The modern industrial health program in a progressive factory is likely to include most, if not all, of the features enumerated below. These features are listed to show the points at which the doctors can be of service to help prevent accidents and control health conditions. These features have been developed in a survey of 2,064 industrial establishments by the National Association of Manufacturers:

1. A program of accident prevention.
2. Exhaust ventilation for dust, fumes or gas control.
3. Plant housekeeping and sanitation program.
4. Room(s) for medical examination and emergency treatment.
5. Maintenance of locker rooms.
6. Pre-employment physical examinations of all employes by doctors—industrial.
7. Maintenance of a restroom.
8. Records of all absences and illnesses.
9. Fatigue prevention program including refreshments available.
10. Employee hospital insurance.
11. Provision for recreational athletic activities.

12. Periodic checkup of illumination of work surfaces.
13. Pre-employment physical examinations of office employes by doctors.
14. Workroom temperature supervision.
15. Periodic check-up of physical examinations of factory employes.
16. Registered nurse in the plant at regular scheduled hours.
17. Maintenance of a lunch room.
18. Health education of employes to prevent ordinary illnesses.
19. Employe mutual benefit association.
20. Doctor in the plant at regular scheduled hours.
21. Fatigue prevention program including posture chairs or aids.
22. Fatigue prevention program including regular rest or relief periods.
23. Periodic check-up of physical examinations of office employes.

I have tried to give you a word picture of the tremendous war program our country is engaging upon. No one, I am sure, can be blind to the fact that with conversion from peacetime to war work living conditions will be radically affected. Health standards will come down; we are battling to hold industrial accidents in check. Equally important are off-the-job accidents on the highways and in the homes. It is going to be the job of the safety engineer to organize for accident prevention; it is going to be the job of the doctor to get the injured man back to work as soon as possible. I do not think the injured worker will want to malingering in these days of high wages.

The National Committee for the Conservation of Manpower in War Industries is glad to have the active support, in its accident prevention and health conservation work, of the Governor and other leading citizens of Minnesota. President Roosevelt has expressed his concern over the problem. On August 18, 1941, he said:

"The nation is confronted with a rapidly rising accident toll. By taking a huge toll in life and property, accidents definitely hinder our national defense effort. To insure maximum efficiency we must have maximum safety twenty-four hours a day—not only at work, but also on the highway, at home, everywhere.

"The troubled times in which we live must not make us callous or indifferent to human suffering. These unusual times require unusual safety efforts.

"I . . . call upon . . . every citizen, in public or private capacity, to . . . do his part in preventing wastage of human and material resources of the Nation through accidents."

On March 20, 1942, the President felt impelled to speak again. He then said:

"It is obvious from the very magnitude of the toll in deaths and injuries that accidents constitute one of the serious impediments to our war production—to extend accident prevention work more widely throughout the country is, therefore, a national necessity at this time (and) . . . must be regarded as an integral part of our national war effort."

This terrible war will come to an end some day. But it may not be soon. When the hostilities cease we shall have a multitude of postwar problems. I rather like the so-called "Bill of Rights" set forth by the National Resources Planning Board as the things for which we should strive in this country. I am going to list them and I direct your attention to the field of work open to the doctors of the United States. Here they are:

1. The right to work usefully and creatively through the *productive* years.
2. The right to fair pay, adequate to command the necessities and amenities of life in exchange for work, ideas, thrift and other socially valuable service.
3. The right to adequate food, shelter, clothing and *medical care*.
4. The right to security, with freedom from fear of old age, want, dependency, *sickness*, unemployment and *accident*.
5. The right to live in a system of free enterprise, free from compulsory labor, irresponsible private power, arbitrary public authority and unregulated monopolies.
6. The right to come and go, to speak or be silent, free from the spying of secret political police.
7. The right to education, for work, for citizenship, and for *personal growth and happiness*.
8. The right to equality before the law, with equal access to justice in fact.
9. The right to rest, recreation and adventure; the *opportunity to enjoy life* and take part in an advancing civilization.

At the opening of my talk I used my recollection of the pioneer doctor to point out that the

old-time family doctor may be on his way back. The problems which confront industry in war-time production do not call for specialists. The accidents which occur with their resultant injuries and the diseases which grow out of unhealthy working conditions are not such as would be strange to the family doctor. Our problem is not in the big plant employing hundreds and thousands of workers. These plants generally have men at the top of management who are seeing to it that they are organized to cope with the problem. They have safety engineers and industrial doctors on the job. Where we need the coöperation of the medical profession is in the problem placed before us by the hundreds of small plants which, so far, have felt that they

cannot afford to employ safety engineers and industrial doctors. A key worker in one of these small plants becomes a very important missing cog in the machinery of production when he goes home because of an injury or an illness.

And so, the biggest and most important help the medical profession can give the war industries of the United States is to coöperate in keeping the worker at work. I ask for 100 per cent teamwork between doctors and safety engineers in this task. Kipling expressed my thought:

"It ain't the guns nor armament nor the funds that they
can pay
But the close coöperation that makes them win the day.
It ain't the individual nor the army as a whole
But the everlastin' teamwork of every bloomin' soul."

CARCINOMA OF THE GALL BLADDER: STUDY OF SIXTY CASES

HAMLIN MATTSON, M.D., M.S. (SURG.)
Minneapolis, Minnesota

IN about one out of every hundred cholecystectomies for stones the surgeon faces carcinoma of the gall bladder. Nearly always a very discouraging problem confronts him.

The disease was described as early as 1777. It has been noted in one in every 250 routine post mortem examinations which represents about 3 per cent of all malignancies.¹⁷ Compared with other parts of the body it is fifth or sixth in frequency.¹³ In some studies a much higher incidence has been encountered. In most statistics it represents between 8 and 10 per cent of all carcinomas in women.

Inasmuch as we have had only six decades of modern gall-bladder surgery, it is possible that further diagnostic clues may be found in recently encountered cases. Further, it is well for us to refocus our attention on a subject which all too frequently is on the periphery of diagnostic vision in our almost daily contact with biliary disease.

I have reviewed the records and specimens of the past decade available to me. Only patients in whom the diagnosis was confirmed by biopsy or necropsy were chosen. Cases with fragmentary records were discarded. On this basis sixty cases from the past decade in Twin City institutions were studied.

If any symptom pattern could be called characteristic, it is presented by a woman over fifty whose trouble began suddenly a few months before with a steady right upper quadrant pain at which time she also began to lose weight. She is apt to have had nausea and vomiting. She may or may not be jaundiced. She is not anemic. She probably has tenderness in the right upper quadrant and the chances are a mass is palpable there. The liver is enlarged. Cholecystographic studies show a nonfunctioning gall bladder.

Age and Sex.—Carcinoma of the gall bladder is a disease of the so-called cancer age. It is very rare before the age of fifty. The youngest patient in this series was thirty-one and the oldest eighty-five, with an average age of 65.4. The average age of males was sixty-eight and of females 63.3. Ninety-three per cent of the patients were over fifty. Cooper² reported the disease in a patient twenty-eight years of age which is the youngest in the recent literature. There were thirty-six females to twenty-four males, a *ratio* of 1.5 to 1. The usual ratio in the United States is three females to one male.

Symptoms.—Most of the patients gave a history which at least was suggestive of malignancy. The disease begins acutely in most cases. Pain is

From the Department of Surgery, University of Minnesota. Abstract of inaugural thesis presented before Minneapolis Surgical Society, January 8, 1942.

the earliest and most characteristic symptom. It was present in 86 per cent in this series. In only 13 per cent was there a long preceding history of gall-bladder disease ranging from three and one-half to thirty-seven years. Half gave a history of three months or less at the time of examination and in 80 per cent symptoms had lasted a year or less. Twenty per cent gave a history of more than a year ranging up to thirty-seven years and in this group it was difficult to define where the signs of malignancy developed.

Thirty-three per cent of the patients in this series specifically stated that the pain was dull and constant, usually in the right upper quadrant or epigastrium. In five per cent the pain began as colic and ended in a steady pain. In about 40 per cent, therefore, the pain was constant or became so.

Weight loss was a striking feature encountered in this series. Some patients dated the weight loss from the onset of the illness. Illingworth of Scotland suggested in 1935 that "weight loss is not a common finding in carcinoma of the gall bladder." This is contrary to the experience in most series in the United States and in my series. Seventy per cent of the patients had lost weight. In no case was a notation of no weight loss made. In 20 per cent the amount was not specified. Losses ranged from 10 to 60 pounds with an average of 27.5 pounds. In 30 per cent the weight loss preceded or was concomitant with the onset of other symptoms. Nineteen of the twenty-nine patients who had lost specific amounts of weight also complained of anorexia, nausea, vomiting or all three. Loss of weight was present in every one of 48 cases reported from the Boston City hospital by Jankelson in 1937.⁸

Jaundice was present in 51.6 per cent of cases at the time of examination. It was usually of gradual onset and steadily increasing severity. Terminal icterus indices up to 135 and 178 were found frequently. In the severely jaundiced patients ductal obstruction was found. Liver metastases usually accounted for the milder types. In one case jaundice was due to torsion only of the common duct. Anorexia, nausea or vomiting or all three were found in 70 per cent. Bloating and belching were found in 45 per cent.

A mass was felt in the right upper quadrant in 48 per cent in this series. It usually was described as hard and nodular and moved with respiration. Sixty per cent of those with a mass

complained of tenderness on palpation of that mass. This is contrary to some statements made in older literature. The liver was enlarged in 48 per cent.

Roentgen Diagnosis.—A nonfilling gall bladder with or without stone shadows is to be expected in carcinoma of the gall bladder. Cholecystograms were made in twenty-five of the sixty cases. All showed a nonfunctioning gall bladder. In twelve calculi were visible on x-ray.

Kirklin stated in 1932⁹ that he was able to diagnose papilloma and adenoma in the gall bladder with considerable accuracy but had not yet made a diagnosis of carcinoma of the gall bladder. He reviewed the roentgenograms of sixteen proven cases of carcinoma. Fourteen gave no dye shadow. Half showed stones. One showed stones with good function and one had a normal cholecystogram. Spitzenberger¹⁵ made a correct diagnosis in two cases on the basis of a fistulous connection between the gall bladder and neighboring viscera.

Stones were found in 70.1 per cent in this series. Recent studies show an incidence of 48 to 100 per cent. The hemoglobin was reported in forty-five cases. The average was 74 per cent. The cases with the lowest values, 26, 34, 45 and 46 showed evidence of hemorrhage into the gastro-intestinal tract.

Pathology.—Fifty-four were adenocarcinomas. Four squamous celled tumors were found. There were two colloid carcinomas.

Grossly scirrhous carcinoma was the most common type found. The gall bladder wall was hard and cartilaginous to palpation. A few cases had involvement of the whole gall-bladder wall and the lumen was obliterated. Microscopically the lesion was an adenocarcinoma with more or less fibrous stroma. Sometimes a tubular structure was maintained whereas in others cells were scattered about in a dense fibrous stroma.

Papillary carcinomas were less frequent. Microscopically the structure was that of a columnar celled adenocarcinoma. Colloid carcinomas filled the lumen of the gall bladder. The four cases of squamous celled carcinoma resembled the scirrhous in gross structure.

It has been written that carcinomas of the gall bladder originate chiefly in the fundus. It is extremely difficult to identify the source in such

an organ as the gall bladder. Very few are seen early. On the basis of surface area alone the fundus would be the more frequent site. Stewart, Lieber and Morgan¹⁶ reviewed twenty-seven cases reported in the literature as being primary in the cystic duct and from the evidence were not certain any of them were primary in the cystic duct.

Because of the extensive lymphatic drainage of the gall bladder and proximity to other organs, metastases are frequent and early. Often the indurated area was in the gall bladder wall facing the liver and in such instances the carcinoma already had penetrated several centimeters into the liver. Metastases were noted in the liver in thirty-eight cases, porta hepatis in nineteen, peritoneum in eleven, cystic duct glands in eleven, retroperitoneal lymph nodes in six, omentum in six, lungs in four, duodenum in four, pancreas four, colon four, suprarenals three, mesenteric lymph nodes three, kidneys two, spleen two, stomach two, sternum one, mediastinum one. In one case a metastasis to the humerus was the first intimation of the disease. In one case the duodenum was involved directly causing obstruction.

There is difference of opinion regarding the direct etiologic relationship between calculi and carcinoma. The experimental evidence is not entirely convincing. Even though a direct relationship has not been proven, it is well established that the two conditions occur most frequently together and calculi at least are a warning sign. The early surgeons encountered carcinoma of the gall bladder more frequently in the days when calculi and inflammation were allowed to battle it out with the body for longer periods. W. J. Mayo¹² found carcinoma in five per cent of a series of 405 operations on the gall bladder in 1902.

Graham⁴ has concluded that 4 to 5 per cent of women of cancer age who have gall stones will

develop carcinoma of the gall bladder. The mortality rate for all types of risks at Barnes hospital for the three years ending 1930 was 1.5 per cent. Lahey,¹⁰ Graham,⁴ Boyce and McFetridge¹ and Lam,¹¹ among recent authors, advocate prophylactic cholecystectomy in women who have gall stones. Before any such policy is undertaken for the country at large one should be armed with mortality and morbidity figures, which are not available at present. If removal of all gall bladders with stones with or without colics should not be advocated for the country at large it is not a criticism of the principle as such.

There is then no diagnostic clinical picture for carcinoma of the gall bladder. The clinical picture will fit many cases of benign biliary disease or cancer in other organs. The following points can be stressed: (1) advanced age, (2) steady dull pain or a change from ordinary biliary symptoms to a more steady pain, (3) weight loss with onset soon after the constant pain, (4) absence of anemia and later presence of (5) a tumor mass in the right upper quadrant and probably jaundice.

It must be admitted that in the present state of our knowledge the outlook is gloomy for diagnosis early enough to salvage these patients. There is no instance of successful removal in this series. Gray⁵ and Paine¹⁴ have performed V excision of a portion of the liver in eliminating contiguous metastases. More general use of peritoneoscopy should eliminate some exploratory operations which only hasten the end of the patient.

More hope lies in revision of our attitude toward the patient with gallstones who is fifty or beyond and who has had one or two attacks of colic. A gall bladder with stones has a greater chance of developing carcinoma than one with-

out stones. Even though the danger of loss of life from carcinoma of the gall bladder were the same or less than the danger from operative procedure, there are other possible tragic developments than malignancy to consider. We should have more follow-up studies like that of Jaguttis,⁷ who traced 114 cases of cholelithiasis treated conservatively for ten to twenty-five years. Five developed carcinoma of the gall bladder, thirteen died of cholecystic disease, twenty-five were operated on for complications, four of whom died. The above does not consider the human suffering which must have been involved.

Calculi are associated with either inflammation or carcinoma.

Innocent gallstones are a myth.

THE USE AND ABUSE OF CHEMOTHERAPY

WESLEY W. SPINK, M.D.

Associate Professor of Medicine, University of Minnesota
Minneapolis, Minnesota

THE sulfonamide compounds are effective in the treatment of many bacterial infections. While very satisfactory results have been obtained in the treatment of certain types of pneumonia, I should like to discuss briefly with you some of the uses and abuses of sulfonamide therapy in upper respiratory tract infections. The widespread use of the drugs for the mildest forms of respiratory diseases of doubtful etiology has been looked upon with considerable apprehension by many physicians. It is becoming apparent that following such a practice, more and more individuals are being rendered sensitive to the sulfonamide compounds, and the incidence of disastrous reactions may be expected to increase. The State of Minnesota is to be commended in the attempt to control the promiscuous use of these drugs. Sulfonamide compounds may not be dispensed without a prescription by a registered physician.

When one considers the incidence of the common cold, and the many forms of treatment and

preparations that have been used in the therapy of this affliction, it was to be expected that the sulfonamide drugs would be given a trial. It is now generally agreed that the sulfonamides are not specific for the common cold. One of the principal difficulties is that the precise etiological agent has not been defined. Epidemics of the common cold are probably of virus origin. Nevertheless, it is a prevalent practice to prescribe a sulfonamide drug for the treatment of this disease. Usually small doses of the selected drug are given over a period of two to three days, and sometimes for a longer period. In defense of such a procedure, it is argued that since the common cold may be succeeded by secondary bacterial infections such as pneumonia, the sulfonamides act as prophylactic agents. With rare exceptions, I do not subscribe to such a routine practice. In the first place, such a procedure gives the individual a false sense of physical security. Too often, instead of going to bed for a day or two the patient keeps on with the daily routine having the feeling that he is being protected against any serious consequences. In the

Presented before the annual meeting of the Minnesota State Medical Convention, Duluth, Minnesota, June 30, 1942.

second place, the great majority of common colds constitute only a minor illness, but the person who has received a sulfonamide may ascribe the termination of his illness to chemotherapy. Many such individuals have a succession of colds, and each time they are tempted to utilize their sulfonamide tablets. Frequently one learns the original medication was initiated by a physician, but when the patient or other members of the family were subsequently the victims of acute coryza, the remaining supply of tablets in the medicine cabinet was utilized without the advice of a physician. Or lacking the drug, the patient has prevailed upon the good nature of his doctor to refill the prescription. The intermittent use of small doses of a sulfonamide will lead to drug hypersensitivity in not a few individuals. I need not dwell upon the disastrous consequences that may be encountered in an individual sensitized to one or all of the sulfonamides. Our policy in the treatment of the common cold is to follow the orthodox procedure; that is, to advise the patient to go to bed, and to treat him symptomatically. If and when a more serious bacterial infection should ensue, then the appropriate sulfonamide is prescribed in full therapeutic doses.

We do use the sulfonamides for prophylactic purposes in selected groups of individuals having an acute coryza. It is now generally agreed that only a rare patient with bacterial endocarditis will respond satisfactorily to sulfonamide therapy. Since the first manifestations of this highly fatal disease, not infrequently, are preceded by an upper respiratory infection, we have recommended that any individual having a congenital or acquired endocardial lesion should go to bed at the onset of a respiratory infection, and take 0.5 gram of sulfathiazole three to four times a day for two to four days. We also have prescribed similar doses of sulfathiazole or sulfadiazine for obstetrical patients who have an acute respiratory infection at or near term.

The sulfonamides have also been used extensively in the treatment of acute pharyngitis, or "sore throat." Here again, the mild character of the illness in many cases does not warrant the routine use of the drugs. Some patients with a pharyngitis of hemolytic streptococcal origin may be acutely ill. In these cases we feel justified in using sulfadiazine in full therapeutic doses; that is, 1 grain per pound of body weight per twenty-four hours in small children, and for adults, an

initial dose of 3 to 4 grams and then 1 gram every four to six hours. The vast majority of cases of acute tonsillitis are caused by hemolytic streptococci. During the past year, sulfadiazine has been used in the treatment of these patients with satisfactory results. The therapeutic response has been by no means dramatic, but many of the patients feel and look better coincident with the use of sulfadiazine.

Acute tracheo-bronchitis may be due to different biological agents. I have been reluctant to use the sulfonamide compounds for this condition, but some of my associates have insisted upon a trial of sulfadiazine not only in their patients, but when they themselves were the patients. Coincident with the administration of sulfadiazine, improvement in the condition of the patient has frequently been apparent. The doses used were approximately those prescribed for patients with pneumonia. We have not been favorably impressed by the results of chemotherapy in patients having chronic bronchitis.

Influenza is a loosely used term. Epidemic influenza is due to a specific virus, and chemotherapy is without effect in experimentally induced infections in the lower animals. Likewise, sulfonamide therapy is not effective in proved human cases of epidemic influenza. As Finland and his associates have pointed out, sulfathiazole and sulfadiazine have been of considerable value in secondary pulmonary infections due to the staphylococcus in patients from whom the influenza virus was also isolated. It is not at all unlikely that sulfonamide therapy may be beneficial for prophylactic purposes when epidemic influenza occurs in a community in association with a high incidence of pulmonary complications.

During the past few years physicians in various parts of the country have encountered many cases of atypical pneumonia of doubtful etiology, and often called virus pneumonia. Many physicians in Minnesota have encountered such cases. The general impression is that the sulfonamides are not very effective therapeutically or prophylactically. However, it is my policy to administer a sulfonamide, usually sulfadiazine, to every patient having evidence of pneumonia. Full therapeutic doses are given for at least forty-eight hours. If at the end of this time, the biological cause of the infection has not been defined, and the patient shows no improvement, chemotherapy is discontinued. In a few instances, where we

have not been able to make a bacteriological diagnosis, the patients have responded quite well following sulfonamide therapy. It is possible that these cases represented pneumococcal infections, although we were unable to isolate pneumococci.

In conclusion, I would like to emphasize that the availability of the sulfonamides has marked a tremendous advancement in our therapy of pneumonia and its complications. The promiscuous use of these drugs for mild respiratory in-

fections of doubtful etiology has afforded questionable therapeutic results, and has provoked many instances of hypersensitivity to the compounds. The medical profession must assume a more critical and conservative attitude for the present in this type of therapy. This must be done in order to correct the present attitude of many lay people who have been led to believe that sulfonamide therapy is an established and harmless procedure in the management of respiratory infections.

THE USE AND ABUSE OF DIGITALIS

(Abstract)

MOSES BARRON, M.D.

Minneapolis, Minnesota

IN spite of all the advances made recently in drug therapy, digitalis remains unrivalled in the treatment of heart disease. Strophanthus and squill belong to the same group but these are not as effective. Strophanthus is used very little in this country though quite extensively in France.

The active principal of digitalis is a glucoside which is a combination of a sugar with the digitoxigenin and as such penetrates the cells more readily to become fixed to the muscles.

For a long time it was thought by many that digitalis was effective only when auricular fibrillation is present and that its effectiveness was due mainly to the slowing of the heart. They overlooked or minimized the primary action of the drug. This primary effect is directly on the myocardium where it increases the force of the systolic contraction and thus helps to empty the ventricles more completely in a failing heart. In addition to increasing the force of the systole the *time* of systole is shortened which allows more time for the diastolic filling of the ventricles and for the recovery of the heart muscles. As Dr. Visscher has so well established through his careful researches, digitalis increases the mechanical efficiency of the heart muscles. The drug may cause marked improvement in heart failure even without cardiac slowing. Cardiac slowing is brought about directly, indirectly and reflexly. Indirectly the excessive irritability of the myo-

cardium is reduced through an increase of the coronary blood flow. When the heart is properly digitalized the cardiac output is increased, the velocity of the blood flow is more rapid, the blood volume is lessened and the heart muscle tone is improved. This is accompanied by an increase in the circulation velocity and usually a decrease in the venous pressure as a result of the improved cardiac output. The blood pressure itself is not directly affected. In congestive heart failure with edema the urinary output is often greatly increased because of the improvement in circulation. Digitalis has no direct diuretic effect on the kidneys. The electrocardiogram may be affected by digitalis in a prolonged PR interval, a shortened QT and depressed ST and T segments. The toxic effect of the drug from overdosage manifests itself through anorexia, nausea, vomiting, diarrhea, abdominal discomfort and visual disturbances. There may be also fatigue, malaise, headache and delirium. It must be remembered that as much as 90 per cent of the drug is usually fixed in the extracardial tissues. The drug is slowly eliminated or destroyed and therefore cumulative toxic effects must be guarded against. It is important to know the optimum dosage of digitalis for each specific case.

Doses of five and ten drops of the tincture of digitalis three times a day in an untreated case are quite worthless since such small doses are insufficient to digitalize the heart or even to be used as maintenance doses. Large doses should be

Abstract of presentation before the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 30, 1942.

given at first to "saturate" the heart muscle with the drug. In severe cases of decompensation as much as eight cat units may be given in a single dose followed by four cat units in four or six hours and then two cat units repeated every four to six hours until evidence of a proper therapeutic effect has been obtained. From then on from one to two cat unit doses should be given as a maintenance dose under careful observation at first. The slowing of the pulse especially in a case of fibrillation is one of the guides for optimum dosage. From fifteen to twenty-two cat units may have to be given in twenty-four to forty-eight hours in order to obtain digitalization. Toxic symptoms must be avoided. The powdered leaf in either tablet or capsule form is becoming more popular than the tincture. Digitalis should be given orally whenever possible. In cases of nausea and vomiting the tincture can be given in a small quantity of water by rectum as a retention enema. In emergency cases the

more purified forms may be given intravenously. This requires special care.

A word should be said as to the indications for digitalis therapy. From a proper knowledge of the physiological effects of digitalis on the heart one is soon convinced that the only real indication for this drug is congestive heart failure. Congestive heart failure from any cause requires the use of digitalis. The etiology of the failure is quite unimportant except that in toxic and degenerative heart lesions the dosage is usually smaller and the drug is administered with greater caution. The principal conditions in this group which may result in heart failure and in which the heart is more sensitive and therefore more susceptible to early toxic effects are coronary thrombosis, the toxic myocardium of acute infections and heart failure associated with hyperthyroidism. With these precautions in mind one can confidently treat heart disease with digitalis and be justified in expecting satisfactory results.

"BUSINESS AS USUAL" OUT

"Business as usual" is out for the private physician and the health officer just as it is for the huge industrial concern, the small manufacturer, the butcher and the baker, Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, declared at the meeting of the Southern Medical Association.

Even if available medical services are rationed under National Service Legislation, as has been proposed and discussed in recent weeks, great efforts must be made, he warned, to increase the supply of personnel. This means keeping enough physicians in medical schools to teach and train more doctors. Medical students and, if the draft age is lowered, premedical students could, he suggested, be enrolled as a special category of professional manpower and, upon completion of internship, allocated among the Army, Navy and civilian services.

"This," he said, "would eliminate the present uneconomical procedure under which the Army and the Navy compete for medical students by commissioning them in numbers which may later prove disproportionate to the needs of the respective services.

"Much depends now and more will depend after the war upon a continuing flow of young, able-bodied physicians of the highest caliber."

The Medical and Health Committee, he reported, has recently approved a plan for increasing the number of graduate nurses and meeting the growing deficiency in hospital nursing services. The plan calls for speeding up the basic training course for completion in 24 months, after which third year students would go on the payroll of the parent hospital or affiliated institutions. They would live outside the hospital, thus leaving dormitory and classroom space for more students. They would not receive their certificates until after three years of training, but their release in the last year would supply civilian hospitals with replacements for the general duty nurses who have been drawn into war service. The physical facilities for nurse training would be increased by one-third and hospitals would be provided with an augmented staff for war duty.

The tough job of supplying medical services in critical areas now lacking them, Dr. Parran said, can best be handled after the manner of handling other tough problems, by breaking it up into a lot of little ones and handling them one by one. Following this thought, plans for meeting needs in different communities will be worked out individually. Such plans are now being made by the Procurement and Assignment Service and the Public Health Service.

Health departments must be protected from too great draft of their manpower. Taking one public health physician from his job, he warned, may mean that three private practitioners will be needed to cure the unprevented sickness. Health departments, however, must cut out all frills, unnecessary inspections, complicated record keeping and long-range programs of doubtful value.—*Science News Letter*, November 21, 1942.

CLINICAL-PATHOLOGICAL CONFERENCE

MINNEAPOLIS GENERAL HOSPITAL

A. J. Hertzog, M.D., and S. V. Loisness, M.D.
Pathologists

Presentation of a Case

DR. BLACKMORE: This patient is a sixty-year-old white male who entered the hospital because of a painful ulcer on the left great toe and swelling of his lower extremities. He was apparently well until eight months prior to admission when he noticed a cyanotic swelling of both hands and pain along the lateral posterior portion of his left thigh. This disappeared and did not recur. About three weeks prior to admission, swelling of his legs began and he developed an ulcer on the left great toe. On questioning, he stated that he had swelling of the lymph nodes of the neck and axilla for the past fifteen years. These had never caused him any discomfort. He had no other complaints, and his family history was noncontributory. He spoke English poorly and a history was obtained with difficulty.

On physical examination his temperature and pulse rate were normal; his blood pressure was 165/80. His hands were swollen and showed a scaly dermatitis. His legs were also swollen and showed a scaly inflammation of the skin. There was an ulcer on the left great toe and bilateral hallux valgus. The chest was clear and resonant, and the heart showed no abnormalities. The liver and spleen were not palpable. There was bilateral enlargement of the cervical, axillary and inguinal lymph nodes; they were discrete and varied from the size of a pea to that of a walnut. There was a small mass in the left lower quadrant of his abdomen that was felt on deep palpation and thought to be enlarged lymph nodes. The remaining examination showed nothing of note. A urinalysis was essentially negative. His hemoglobin was 86 per cent, red blood count was 4,500,000, and a total leukocyte count was 24,850. The differential leukocyte count showed 76 per cent lymphocytes, 17 per cent neutrophils, 5 per cent monocytes, and 2 per cent eosinophiles.

DR. HERTZOG: Did a morphological study of the blood smear reveal any immaturity in the lymphocytes?

DR. BLACKMORE: The majority of the lymphocytes were of the small mature variety, and no immaturity in any of the leukocytes was found.

DR. PETIT: Could this be a leukemoid reaction?

DR. SCHLEICHER: Leukemoid reactions generally affect the myeloid cells rather than the lymphocytes, and in this particular case, such a reaction is not strongly considered.

DR. HERTZOG: In a leukemoid reaction, there should be some immaturity in the white blood cells.

DR. GRATZKE: The radiographs of his chest do not reveal any definite abnormalities. There is a suggestion of cardiac enlargement of the left ventricular type.

There is shortening of the thoracic cage and some collapse of the vertebral bodies. Radiographs of his hands and feet show a marginal sclerosis that is associated with chronic arthritis. There is a marked hallux valgus of both feet. I do not see anything particularly abnormal in these films.

DR. HERTZOG: Was there any explanation for the skin eruption and edema of his extremities?

DR. BLACKMORE: The skin eruption was considered by the dermatologists to be a nonspecific variety of chronic dermatitis, and in his lower extremities probably related to varicosities. The edema was thought to be on an inflammatory basis secondary to the dermatitis.

DR. HERTZOG: One would naturally think of chronic lymphatic leukemia with the generalized lymphadenopathy, 24,500 leukocyte count and 76 per cent lymphocytes. However, the blood smear in itself is not diagnostic of leukemia because of the lack of immaturity in the lymphocytes. One can only say that the blood picture is compatible with, and suggestive of, chronic lymphatic leukemia. The term aleukemic leukemia is used to describe those cases of leukemia where no immaturity can be demonstrated in the peripheral blood. The total leukocyte count is often normal or below the normal range. It is in these cases that we have to rely upon bone marrow studies and lymph node biopsies to establish the diagnosis.

DR. BLACKMORE: An aspiration of the sternal bone marrow and a biopsy of an axillary lymph node were done. Dr. Schleicher will give us the result of his bone marrow study.

DR. SCHLEICHER: There was the possibility that the blood picture and chronic lymphadenopathy in this case were the result of the skin lesions. It must be kept in mind that frequently it is not possible to give an interpretation of the blood picture until it is correlated with the clinical findings and bone marrow pattern. Hence a bone marrow aspiration was done to determine whether the marrow was involved in a leukemic condition. A biopsy of a lymph node was done, as a double check is often desirable since one or the other or both methods may establish the diagnosis. In this case, on aspirating the sternal marrow, numerous small particles of tissue ranging from less than a pin head in size to 2 mm. in diameter were found. This is quite an unusual finding. I will pass around a test tube with these minute tumor masses suspended in a fixative. Besides the usual smears made from the aspirated marrow, the small tumor nodules were placed in Helly's fixative and paraffin sections were made just as with any other tissue. I will now demonstrate one of these slides with the lantern. The tumor masses are composed of reticulolymphocytes, medium and small forms. The latter are morphologically identical with those observed in the peripheral blood. The pattern of the tumors suggests local production of lymphocytes. Mitosis is infrequent. They have not as yet replaced large amounts of myeloid and erythroid tissue since large patches of normal marrow are seen between the nod-

ules. It appears that the process destroys bone trabeculae and compresses or injures hematogenic tissue. When large, the process may be seen by x-ray as rarefactions. In view of the long history given by the patient, I would venture to say that the process is slowly growing. This is a variety of lymphatic leukemia first described by Zanaty in 1934 as "leukemic lymphoma of the bone marrow." Storti, in 1937, pointed out that in these cases a lymphadenopathy, splenomegaly or hepatomegaly may or may not be present. The lesion may be restricted to the bone marrow with other organs only slightly or not involved. You are aware of the fact there are differences of opinion whether leukemia is a neoplastic process or a benign hyperplasia. I favor the former concept.

DR. LOFSNESS: Why is this type of leukemia so rarely observed and how large may these tumor masses reach?

DR. SCHLEICHER: The reason is the tendency of many pathologists to omit an examination of the bone marrow in frank cases of leukemia. The nodules may vary from a size of a pin-point to that of a pea. The latter type generally produces demonstrable changes in the skeletal system. In this case, the nodules were too small to produce any changes in the bones as seen by x-ray.

DR. HERTZOG: Did you make any smears or imprints from the bone marrow besides the sections of the small nodules?

DR. SCHLEICHER: Yes, imprints and spread preparations were made. They showed a small number of reticulum cells differentiating toward lymphocytes. These immature lymphocytes are reticulolymphocytes. Medium sized lymphocytes were present in a moderate number. The small mature lymphocytes constituted the predominant elements. Occasionally a mitotic figure was observed.

DR. LOFSNESS: I will show with the projector the first slide made from the biopsied axillary lymphnode. It shows only partial obliteration of its normal architecture; many of the sinuses are intact. In other parts of the node, there is a uniform proliferation of small lymphocytes replacing the normal pattern. If the whole node looked like this, one would say that it was leukemia. However, as the node is only partially involved, we can say only that it is probably leukemia.

STUDENT: What else could it be then?

DR. LOFSNESS: One has to consider nonspecific hyperplasia or, if you want to use the term, lymphadenitis. However, we made more sections from this node nearer the center. These latter sections show complete obliteration of the normal structure by a marked proliferation of small discrete round cells. This section is diagnostic of leukemia.

DR. SCHLEICHER: This brings out the necessity to cut lymphnodes through the middle and make at least one section from each half of the node. The findings in the lymphnode agree well with those in the bone marrow.

INTERN: Is there immaturity of the lymphocytes in the lymphnode?

DR. HERTZOG: It is very difficult for the pathologist

to recognize immaturity of lymphocytes in sections of fixed tissue with hematoxylin and eosin stains. The diagnosis of leukemia in this lymphnode is based more on histologic criteria than on cytologic changes. When we wish to study the cytology of cells from lymphnodes, it is best to make imprints from the fresh node before fixation, and stain them with May-Grunwald-Giemsa or Wright's stain, just as we would blood cells. Much of the argument in the past among hematologists has been due to attempts to classify cells from slides prepared from fixed tissue. In bone marrow studies, it is ideal to combine the two methods. We can use the dry imprint or smear method for cytological study and the fixed paraffin section for a study of the architectural pattern. We can ask Dr. Gratzek what he thinks about x-ray therapy in these chronic cases of lymphatic leukemia. I think we all agree that x-ray therapy is contraindicated in the acute cases.

DR. GRATZEK: Absolutely. In the chronic cases, one can reduce the size of the lymphnodes and symptomatically they seem to improve for a while, but you get a recurrence just as you do in Hodgkin's disease.

DR. PEPPARD: I would like to ask Dr. Schleicher to express an opinion concerning the idea of leukemia, in general, being a neoplastic disease.

DR. SCHLEICHER: I am not sure that I have the qualifications to express an opinion. I wish to say that I am in sympathy with the group that regards leukemia as a neoplasm. For a long time, Dr. Ewing has maintained that the lesion eventually undermines the health of the patient and interferes with the function of vital organs as any other neoplasm. Leukemia follows a pattern characteristic of neoplasms and this feature cannot be overlooked. There may be a benign stage which gradually shades into neoplasm, but the transition may occur over a period of many years. That leukemia may be precipitated by infections or other illnesses does not disprove that leukemia is a neoplasm. The patient eventually dies from the disease or its complications, regardless of the type of leukemia or state of differentiation. What do you think, Dr. Hertzog?

DR. HERTZOG: The question is still unsettled, but most of us believe that leukemia is a type of malignant lymphoblastoma. Some investigators readily admit that mouse leukemia is a neoplasm, but are not convinced that mouse leukemia and the human form are the same disease. I heard a paper a few years ago in which the author attempted to show that acute lymphatic leukemia was a neoplastic disease while chronic lymphatic leukemia was a separate non-neoplastic disease. I do not think many agree with him as his evidence was based largely on vital staining technique. In this part of the country, we do not consider this a reliable method.

DR. PEPPARD: I am in no position to hold an opinion or belief in anything other than what I have learned in discussions similar to this. I think I have turned more particularly towards the idea of a neoplasm.

DR. HERTZOG: If there is no further discussion, we will conclude the meeting. The diagnosis in this case is chronic lymphatic leukemia. Dr. Schleicher tells us that we are dealing with an unusual variety because of the small tumor nodules found in the bone marrow, and that it can be properly called leukemic lymphoma.

HISTORY OF MEDICINE IN MINNESOTA

THE ASIATIC CHOLERA IN SAINT PAUL

JOHN M. ARMSTRONG, M.D.

Saint Paul, Minnesota

PROBABLY few of our residents or of our local physicians know that the Asiatic cholera ever occurred in Saint Paul, or perhaps even in the United States. Since we are dealing with Saint Paul in this sketch, it is not necessary to go into the history of cholera in India. One may state, however, that it was not until the year 1831 that the disease reached Europe by way of the Caravan Route through Persia to Russia; from there it spread to Western Europe.

To understand how and why the disease came to Minnesota it may be well to outline its progress from Europe to North America. In June, 1832, the disease reached Canada with emigrants from Ireland, and from thence by way of Detroit to the United States. About the same time also it was brought to New York and in October entered the country through New Orleans. From these centers it spread westward to the Ohio Valley from the East, along the Great Lakes from Detroit to Chicago, and northward up the Mississippi Valley, and by 1833 reached as far as the Pacific Coast. In 1833, however, the eastern seaboard was almost free from the disease. The cholera again was imported to New York in 1834, and to New Orleans from Cuba in 1835 and was spread in the West until the winter of 1837-1838. For the next ten years the United States was practically free from it. In 1848 another visitation took place. The disease broke out almost simultaneously in New York and New Orleans and in 1849 overran the entire country East of the Rocky Mountains, and again the same year gained admission through Canada. By 1850, it was widespread throughout the entire Mississippi Valley, and the same year appeared in San Francisco, being introduced via Panama. In 1851 the epidemic began to abate, but in 1854 the disease again was imported from Europe and the West Indies and prevailed generally throughout North America and particularly in the basins of the Mississippi and Ohio Rivers. After 1855 only scattered cases occurred until 1866, when it again was introduced at Halifax, New York, and at New Orleans. In 1873 cholera again was imported and for the last time assumed epidemic proportions in North America.¹

In summary, these five epidemics of the disease have occurred in the United States. That of 1832-1837 did not affect us because there were no settlers in Saint Paul until 1838, and but seven families settled there that year. There is, then, no record of any cholera in Saint Paul during the first epidemic because there are no records of anything. It is true that Fort Snelling, or Fort St. Anthony as it was first called, had been established in 1819, but the records of that post from its establishment to the year 1861 are lost. The reports of the Surgeon General of the Army exist, however, and record but a single case of cholera at Fort Snelling in 1854, a recruit who was ill when he arrived.

In the year 1849, Minnesota Territory was established, Saint Paul was in-

corporated as a town, Ramsey County was organized, a newspaper started and local records began. Williams, in his *History of Saint Paul and Ramsey County* (1876), stated: "One or two cases of cholera occurred this season (1849), on May 3, L. B. Larpenteur, father of E. N. and grandfather of A. L. Larpenteur, arrived in Saint Paul and on the seventh died of cholera, aged seventy-one years. He had unfortunately contracted the disease on his journey up the river." In a discussion of this paragraph about twenty years ago, Mr. A. L. Larpenteur stated that his grandfather had left Baltimore and had come to Saint Paul by boat down the Ohio, and up the Mississippi River. He also stated that a man named Lumley, in his employ, had died of the disease some weeks later and that there were other deaths from the disease. This statement is confirmed by the United States Census taken in the autumn of 1850 as follows:

District in the County of Ramsey, Minnesota Territory
1850 Census
Deaths Year Ending June 1, 1850

<i>Name</i>	<i>Age</i>	<i>Place of Birth</i>	<i>Days Ill</i>	<i>Cause of Death</i>
Pierre Gervais	8	Minn. Terr.	42	Unknown
Magdelin Donna	60	Canada	15	Fever
Antoine Bourais	80	Canada	30	Pulmonary
Zoe Bivot	25	Canada	2	Cholera
John Baptiste	2	Canada	30	Pulmonary
Sophie Poncin	7	Minn. Terr.	3	Cholera
Alex. Ramsey, Jr.	4	Pennsylvania	14	Fever
W. A. Forbes	6/12	Minn. Terr.	21	Inflam. Brain
Phoebe Glass	8	Wisconsin	2	Burned
Mary Jane Barber	5	Iowa	3	Congestive
Albert Barber	2	Iowa	3	Congestive
John Lermley	23	Ohio	5	Cholera
James Green	40	Pennsylvania	1	Cholera
Elijah Gladden	35	Ohio	5	Cholera
Francis Robert	25	Missouri	90	Consumption
James Goodhue, Jr.	2	Wisconsin	20	Teething

Note that the population of Ramsey County was 2,197, but the county at that time embraced practically all of the present Ramsey, Anoka, Mille Lacs, Isanti and Kanabec counties. The population of Saint Paul was recorded as 1,294; almost half of these had arrived during the year. This census is the first mortality record for Minnesota. Since the record begins with June, 1849, Mr. Larpenteur's name is not included and as the record ends in June, 1850, no doubt other cholera deaths occurred later in the summer of the latter year. No attempts were made to collect mortality statistics in Minnesota until 1866 when the Board of Health in Saint Paul required birth and death certificates to be filed, although some deaths and births were recorded with the clerk of the District Court beginning about 1860. In making this statement I include church records, but these have never been collected and do not, as far as I know, give the cause of death except in rare instances. A United States census was made in 1857 and again in 1860. That of 1857 contains no mortality statistics while that of 1860 contains a list of deaths with the causes of death for the year ending June 1, 1860. No cholera deaths are recorded for Saint Paul.

To go back to John Lumley, whose name as well as that of Barbour is misspelled in the report. It seems that he was an Odd Fellow and had been initiated into the lodge only four days before his death. The Fraternity turned out at his funeral, the first they had been called on to conduct. Referring to their new white regalia, James M. Goodhue, the editor of *The Pioneer*, wrote that

he "had not seen such a display of clean linen since the Territory was formed."

It was claimed, of course, that all the cholera came from below and that no cases originated in Saint Paul. Although this was good publicity and in the main correct, it was not entirely true.

Corresponding to the general course of the disease in the United States, there probably was but little cholera in Saint Paul between the years of 1850 and 1854. In so stating, however, one must say that records of events during these years are much fewer than at later dates. Governor Ramsey, in his diary under the date of June 11, 1861, noted that a steamboat arrived in Saint Paul the day before with "a few cases of cholera aboard" and on May 23, 1852, stated: "A young woman by the name of Dibble died at noon after an illness of two days, supposed to be cholera, giving great uneasiness to our people," and again on May 31, 1852, "Several very sudden deaths in town within the last few days, generally believed to be Asiatic cholera." No doubt the following paragraph by D. A. Robertson in the *Minnesota Democrat* for June 26, 1852, referred to these or still later cases: "If you are anxious to commit suicide drink plentifully of swamp water. We know of several cases of sudden death that might have been traced directly to the use of that beverage."

Early in May, 1854, the citizens of Saint Paul began to be worried because of the increased development of cholera along the river. It being reported prevalent at Keokuk and Galena, on May 25 "at a special meeting of the Common Council called to take into consideration the sanitary condition of the city [which became a city in 1854] and for the appointment of a Board of Health," an ordinance was formed establishing a Board of Health consisting of one citizen from each ward and the city physician. There having been no city physician, the Council appointed Dr. James Dinsmore Goodrich to fill that position, and the members of the Board were John P. Owens, first ward; Lott Moffett, second ward; and George W. Farrington, third ward. Previous to this time there had been a Committee of Health of the Common Council, and it was on the recommendation of this committee on May 23 that the above special meeting was called. From all accounts I have been able to collect, this was a hard worked Board and none of them shirked his duty. Immigrants were now pouring into Saint Paul and the city, being the head of navigation, was the dispersal point for them. Each steamboat brought in a hundred or more Irish and German emigrants packed on the lower deck. Previous to this time the inhabitants of Saint Paul had been mostly French-Canadians and Americans. It is needless, perhaps, to state here that the only approach to Saint Paul was by river. The railroad reached Galena in 1854, but did not reach Saint Paul until a decade later. In the winter, therefore, the city was more or less isolated, although a stage line (Burbank's Express) ran to Prairie du Chien or to La Crosse in the winter. Accommodations by stage were limited and the journey was uncomfortable and expensive.

How the cholera was disseminated by the boats is easily understood. There was no law limiting the number of passengers or enforcing examination of immigrants. The immigrants were packed aboard on the lower deck like sardines in a box. One must not get the idea that the river itself was contaminated, as the mode of transmission was more direct. All water used on board was taken from the river and poured into barrels on the lower deck from which the crew and passengers helped themselves, dipping it out with any utensil they had at hand.

(To be continued in January issue.)

President's Letter

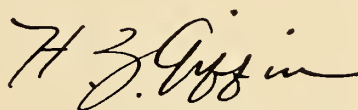

I

WE HEAR much of the four freedoms: freedom of speech and of worship; freedom from fear and from want; and the fifth is economic freedom. Medicine also has its freedoms which must be saved from dictatorial regulation. There is the freedom to learn without being told just what we should learn, the freedom to improve, the freedom of investigation and research, the freedom to treat patients as we think they can best be treated, the freedom to gain rewards commensurate with ability as well as the freedom to treat patients without charge for the good of our souls and, finally, the freedom to improve the public health by every sane, scientific method. All of these freedoms, as well as the freedoms of the patient, will slip away unless we are eternally vigilant. Medical organizations are primarily scientific and educational. Fortunately, however, there are friends of medicine and friends of science among the laity. The work of the National Physicians Committee in informing the laity and legislators of the accomplishments of medicine, and of the constant fight of medical organization for the public welfare, has brought to light many friends of medicine. This organization has been very active during recent months in contacting the members of the national Congress. It is discovering the friends of medicine who will be of practical assistance in maintaining the freedoms of physician and patient. The results indicate that more than 300 congressmen out of 435 believe they should work for the preservation of the professional (vs. the trade) status of physicians, should oppose compulsory health insurance and should favor maintaining the personal doctor-patient relationship. On this basis we can assume that they also recognize the importance of maintaining other features of the democratic way of life for physicians and patients. Our friends doubtless will not only help us in legislative matters but they will also assist in bringing about modifications in the edicts of some of those who seem to "know all the answers." Let us keep before us the importance of the freedoms of medicine and show our gratitude in every way to those who are the friends of medicine; and let us use our influences individually to discover more friends of medicine.

II

On rereading my letters of the year, I am especially impressed with the fact that the problems discussed in them have been considered so thoroughly and solved so well by the Council, by our administrative staff, and by our various committees in cooperation with existing agencies. Industrial health, medical training for civilian defense, vaccination and immunization, the control of cancer and tuberculosis, sickness insurance, procurement and assignment of physicians, and medical education during wartime are some fields in which there has been great activity. The committees on medical testimony, on tuberculosis, and on public policy attained national recognition. Others can do likewise. The work of the Committee on Industrial Health will be most important during wartime. Specific accomplishment can be attained best through the studies of committees and their recommendations to the Council. In fact, an organization may thrive or die at the hands of its committees.

The Council has been especially alert and active under the leadership of Dr. W. L. Burnap. There seems to be general agreement that our annual meeting was all that could have been desired from an educational and scientific standpoint, and especial thanks are due the various committees of Duluth which made it a success. I am happy to have had the good fortune to be your president during such a successful year. My valedictory was expressed in the annual address; there remains nothing but to retire gratefully with all good wishes to my successor and with the hope that I shall be able to be of some service to the Association in the future.

INDUSTRIAL HEALTH

PRIOR to the turn of the century the health
of the industrial worker received little or no
consideration on the part of the employer. Long
hours, unsanitary working conditions, the em-
ployment of children, all indicated a callous con-
science on the part of the employer and society
in general.

Much progress has been made within the
memory of many of us in improving the status
of the worker. There is no question but what
the labor union has been largely responsible for
correcting the evil of long hours and low pay
which in previous generations constituted a na-
tional disgrace. Legal enactment, the result of
an aroused public conscience, also did much to
better the status of working men and women.
The Workmen's Compensation Law is an exam-
ple. The Social Security Act, which provides for
unemployment and old age, enforces provision
for needs that are almost surely bound to arise.

In recent years there has been a rapidly grow-
ing interest in Industrial Health. Much has al-

ready been accomplished in the prevention of
industrial accidents. Much has still to be ac-
complished in the prevention not only of acci-
dents but of illness amongst the workers. The
services of physicians have been more and more
sought by industry for the purpose of reducing
accidents and sickness in the interest of greater
efficiency. This has applied mainly to large in-
dustrial plants, while the smaller concerns for
financial reasons have dispensed with medical
services.

The medical profession has shown an increas-
ing interest in Industrial Health. In 1939 a
Council on Industrial Health was established by
the American Medical Association, and a num-
ber of state medical associations, including Min-
nesota, have established Committees on Industrial
Health and Occupational Diseases. For over a
year our state committee has been publishing in
the journal each month a page on various sub-
jects related to Industrial Health.

In this number of MINNESOTA MEDICINE the
subject of Industrial Health is being featured.
The six addresses on the subject which were
presented at the last meeting of the State Med-
ical Association appear in this issue.

With the speed-up of industry incident to the
war, the importance of reducing the loss of man-
hours due to accident and sickness becomes of
vital importance. It is said that this loss in war
production amounts to 6,000,000 work days each
month.

Plans for cutting down this enormous loss in
the war effort require not only the services of
medical men but the coöperation of engineers,
sanitary experts, health and police departments.
Activities include the prevention of accidents
within and around industrial plants, supervision
of health conditions in the homes of the workers
as well as the medical care of those suffering
from accidents and sickness. The employment of
untrained workers and the mushroom growth of
new communities provide additional problems for
preventive medicine, public health and social hy-
giene.

One attempting to interest himself in the sub-
ject of Industrial Health is likely to be left in

a daze because of the many ramifications of the subject. State and county medical societies should, however, interest themselves to the extent at least of instituting Committees on Industrial Health which should be composed of representatives from private practice, industrial practice, the local health department and the local medical society.

In order that steps may be taken to correct unhealthful conditions in industrial plants, health officers must know what conditions need correction. Practitioners must be relied upon to report occupational diseases encountered in their practices. Many months ago forms were sent physicians for the reporting of occupational diseases. The response has been disappointing. It is possible that physicians hesitate to report information of this sort on the grounds that this would constitute a betrayal of confidence. This information is to be used, however, only for statistical purposes and scientific study. No information so obtained may be used under the law in any court. Physicians are urged to comply with the law and report all occupational diseases promptly to the Division of Industrial Health, State Department of Health, University Campus, Minneapolis.

THE PHYSICIAN AND INDUSTRIAL HEALTH

THE problems of industrial hygiene may be attacked from two angles: (1) the hygiene of the individual, and (2) the hygiene of the environment in which he works and lives. The first problem is a proper function of the medical sciences, while the working environment has to do largely with engineering practices. It is the province of the medical profession to diagnose diseases and primarily to recognize the existence of such diseases as may be due to the working environment. Based on the conclusions of the physician, the engineer learns what unhealthful conditions should be investigated and what control measures are to be initiated. It is essential, therefore, that the various professions understand clearly the functions of each and approach the solution of the problems of industrial hygiene as a joint effort and coöperate with one another to the fullest extent.

The medical problem may best be approached by grouping physicians in industry into full-time industrial physicians and part-time and

on-call physicians. Approximately 85 per cent of workers are employed in small plants in which there are no organized medical services. Services to these industries are supplied by private practitioners including specialists in various fields, some of whom have made important contributions to industrial medicine. The medical departments of large industrial plants serve as models of efficiency and have demonstrated their work. The problem confronted by these departments in large industries in the present emergency is largely one of expansion of existing facilities. The fact that medical service to 85 per cent of our workers is predominantly in the hands of private physicians presents an important problem of coördination of effort. In large industries the relatively few full-time men who are specialists in industrial medicine have engaged chiefly in measures for the prevention of occupational disease and the promotion of health. Opportunities of a like nature and probably on a larger scale exist in small manufacturing establishments and are available to physicians who render services to these plants. These practitioners have, in the past, limited their industrial activities largely to the treatment of occupational injuries and diseases and have failed to a considerable degree to see the opportunities afforded by industrial hygiene.

Since its organization in 1939 the Council on Industrial Health of the American Medical Association has been active in stimulating the contributions which the physician, individually and through medical organizations, can make to the industrial workers. It has also stimulated the formation of committees on industrial hygiene in state and county medical organizations and has clearly outlined a program which can be adopted by the state and local societies. Among the objectives of this program are: (1) the training of physicians to recognize and report occupational diseases; (2) the training of industry and labor to the value of industrial health conservation; (3) the elevation of medical relations and standards in workmen's compensation; (4) a scrutiny of all social legislation affecting industrial health; (5) a clarification of relationships between industrial and private practitioners; (6) the improvement of relations between physicians and insurance; and (7) the establishment of working relations with all state agencies interested in industrial health. The need for coöperation be-

tween all interested agencies, both official and voluntary, is plain. The private practitioner, either as an individual or through the state or local medical organizations, should utilize to the fullest extent the services which may be rendered by official agencies in the field. In order to accomplish their objectives, public health workers in industry and in the various government services must make a genuine effort to aid in the development of industrial health services through the agencies of organization of the private physician. No program of a public health nature can be carried to its logical conclusion without such coördinated effort. In the past there has too often been obvious failure to effect such coöperation. This failure must be recognized and surmounted if the best interests of the industrial worker are to be served.

STANLEY J. SEEGER, M.D., *Chairman,*
Council on Industrial Health,
American Medical Association.

PRE-ELECTION ACTIVITIES OF THE N.P.C.

THE National Physicians Committee, as all physicians should know, is the organization of physicians throughout the country interested to the extent of five or ten dollars a year, or a little publicity effort or both, in the future of medical practice in our country. The members of this organization appreciate the high grade of medical care furnished in our country compared with other countries, favor continued trial of methods aimed to relieve the unequal distribution of costs of sickness, but are opposed to the government's taking over the practice of medicine.

The function of the National Physicians Committee since its organization three years ago has been primarily publicity—to acquaint the public with the achievement of American medicine and to emphasize the desirability of maintaining the practice of medicine in America as a private and not a governmental activity. This Committee transmits from its headquarters in Chicago stories which preach sound medicine to over 12,000 newspapers throughout the country. Definite results of this publicity are intangible, but its policy is sound. Last July the Committee obtained the services of about 2,000 of its members in forty-eight states to sound out some 800 candidates for Congress on their attitudes

towards questions of importance to physicians. The questions put to them were:

1. Do you favor exempting the professions from the provisions of the anti-trust laws?
2. Do you favor the enactment of legislation which will provide for physicians as a professional group a definite status and the obligation to maintain standards designed to protect the public in matters pertaining to health?
3. Do you favor payroll tax deductions—Federal Compulsory Insurance—to provide for hospital and/or medical care costs in the United States?
4. Do you favor entrusting to the medical profession the responsibility for preserving, extending and further improving our system of medical service in the United States?
5. Do you favor any restrictions or limitations on the choice of physician by any individual seeking the services of a doctor?

The purpose of the contact of these candidates was to acquaint them with Medicine's point of view concerning Compulsory Health Insurance and other medical and health issues and to explain the nature and meaning of the Federal Court decision branding all physicians criminals and calling their attention to the need for new legislation exempting the profession from the provisions of the Sherman Anti-Trust Laws.

More than 100 of the candidates signed the questionnaires and added supplementary comment. The successful candidates at least know the viewpoint of physicians. From the replies received it is estimated that more than 300 out of 435 Congressmen have pledged themselves:

- To preserve the professional status for physicians
- As unalterably opposed to compulsory health insurance
- To avoid—at any cost—the sacrificing of the sacred doctor-patient relationship

This preëlection request by the Physicians Committee as to the stand on medical matters of each candidate for Congress is a new venture. This political effort is much like the system used in Minnesota. The aim is to reach every congressman through a physician in his home community when adverse legislation is pending in Washington. While a candidate's stand on medical legislature is not the entire consideration to be taken into account as to his qualifications for Congress, yet between two candidates both equally patriotic regarding the conduct of the war and the one opposed to and the other in

favor of the government taking over medical practice, it is well to be informed.

The N. P. C. has issued its call for support of the physicians of America.

Minnesota's record in support of the National Physicians Committee is enviable. Last year Minnesota physicians contributed more money to the Committee than those from any other state. This year we are far behind our last year's record in support of this movement which deserves the united effort of all medical men. In spite of the many demands for financial support the N. P. C. deserves continued support.

OUR LADY OF GOOD COUNSEL FREE CANCER HOME

REV. JAMES L. CONNOLLY

Saint Paul, Minnesota

On December 8, 1941, a home was opened in Saint Paul for the benefit of poor people, victims of cancer. It aims to provide care for the afflicted without consideration of race, or color, or creed. In the brief period that the doors of the home have been opened it has given hospitality to more than ninety patients, representative of the various nationalities and faiths of people in the Northwest. The services of the home are free. No remuneration or compensation is accepted by those in charge for the care they give their patients.

The name of the home is: Our Lady of Good Counsel Free Cancer Home. It is located at the corner of Cleveland and St. Anthony Avenues, in Saint Paul, easily accessible by bus and trolley from all points of the Twin Cities. A group of sisters carry on the work of the home. They are of the Catholic faith and wear the religious habit of the Dominican Order. Their community is called: *Servants of Relief for Incurable Cancer*. As the name signifies, they are dedicated especially to shelter and care for people whose malignancy is considered not subject to remedy and who happen to be indigent in the sense that they could not meet normal hospital expenses. At the home, the sisters do all the nursing. They do the laundering and the cooking besides.

The accommodations of the home are for sixty-seven patients. However, there is room sufficient to permit an expansion to house as many as one hundred sick. The home is arranged attractively with two large, bright, high-ceilinged wards on each floor. Pictures, plants, and flowers are used effectively to provide a cheerful atmosphere. Each ward is serviced from a utility-room which is well provided with all necessary accessories. While the facilities of the home do not allow for surgery or x-ray treatments, most of the means necessary to assure the comfort of the patients and adjust them to the character of their illness are secured. There is a well-stocked pharmacy. The build-

ing and grounds afford ample space for the use of ambulatory patients, and there are two large parlors for the reception of visitors. A physician is in attendance and subject to call.

It is interesting to note that this work on behalf of the cancerous poor, while new to the Northwest, has been known on the Eastern seaboard for almost fifty years. The youngest daughter of Nathaniel Hawthorne began it quietly and unostentatiously in a small apartment which she rented on the East Side in New York. Prominent as a poet and writer, known to society with her husband as a popular member of the younger set, Rose Hawthorne Lathrop had her father's interest in the poor and afflicted. She felt a sense of personal responsibility for them. And when she became aware through the sickness of a dear friend, Emma Lazarus (herself a poet of renown), of the mental as well as the physical discomforts that accompany cancer, she felt herself impelled to give her time and devotion to ministering to the needs of poor people whose suffering was accentuated by neglect. Even while her husband was living, she followed a course of nursing in the New York Cancer Hospital, and set up a service of house-to-house nursing. After the death of her husband in 1898, she gave all her thought to this work, and enlisted the sympathies and aid of her many friends. In a short space of time, her East Side apartment grew to become a nursing home where twenty or more patients of both sexes could be cared for and her efforts were supported by those of other young women who were drawn by the force of her example to help in the work. One of her first recruits was a young woman, a portrait painter, who came to New York to study art. Alice Huber had a letter of introduction to Mrs. Lathrop. It was supposed to open the door to New York society. She brought the letter to Mrs. Lathrop in her East Side dingy home, timidly offered to help, and within a few months time gave up all thought of a career in art and took up instead the tasks of nursing poor bodies that she found beautiful even amid the waste and the sores of their affliction.

Such a work of kindness could not go unnoticed. People commented on it. Physicians coöperated with it. Men of means contributed towards maintaining it. And it was not long before, with increasing demands and growing resources, a new home was set up in Westchester County. There on high hills overlooking the Hudson was founded in 1901 a home that is an emphatic manifestation of the fundamental goodness of humankind.

In this same year, 1901, Mrs. Lathrop obtained the approbation by church authorities of her work. She became the foundress and first superior of a religious community whose chief object was to provide free care for poor people afflicted with cancer. To foster her ideals and to acquaint others with the work being done, Mother Alphonsa Lathrop, as she was called in religion, issued a monthly publication, entitled: *Christ's Poor*. In it she sketched the story of her labor of love, recounted many little anecdotes of happenings in the two free homes that she had established, listed the needs and acknowledged the benefactions received. It

is worth recording that Mark Twain volunteered his aid saying, in part, in a letter to Mother Alphonsa:

"I have known about this lofty work of yours since long ago—indeed from the day you began it; I have known of its steady growth and progress step by step to its present generous development and assured position among those benefactions to which the reverent homage of all creeds and colors is due; and I am glad in the prosperous issue of your work, and glad to know that this prosperity will continue and be permanent—a thing which I do know, for that endowment is banked where it cannot fail until pity fails in the hearts of men. And that will never be" (Oct. 19, 1901).

Mark Twain was accurate in his estimate of human pity. The work has not failed. It has grown to consist now of six homes in which upwards of seventy sisters care for in the neighborhood of a thousand cancerous patients a year. The Saint Paul home is the sixth one established. The other Homes are: St. Rose's Home, New York City; Rosary Hill Home, Hawthorne, N. Y.; Sacred Heart Home, Philadelphia; Rose Hawthorne Lathrop Home, Fall River, Mass.; Our Lady of Perpetual Help Home, Atlanta, Ga. Each of these foundations is practically debt free. When the Saint Paul Home was opened it had but little debt, and all the monies for the purchase of the property and the preparation of the home were borne by the community that was to do the work. Since the establishment of the Home in Saint Paul, there has been no public solicitation of funds. Nor will there be. The Home does not look to support from the Community Chest or any organized charity. It takes nothing in the way of remuneration from the families of the sick cared for. Support has been of a voluntary, unsolicited nature, and it has not been slow in coming. Various organizations of women have volunteered their aid in preparing bandages and dressings for use at the Home.

For the information of physicians who might be interested in directing patients to accept the hospitality of Our Lady of Good Counsel Free Home, the following points are stressed:

1. Any poor person, afflicted with cancer that is considered irremedial can be entered into the Home on recommendation of physician or clergyman.

2. There is no limitation of acceptability based on religious or racial grounds. The Home is conducted by sisters of the Catholic faith. But they welcome the afflicted with cancer of every sect and color. The only limitation indicated, and it is a reasonable one, is that the patient must be certified to be mentally sound. The fact of the Home being organized on a ward basis and the close association of the patients is sufficient warrant for this condition being made.

3. The services of the Home are open to people, regardless of locality. The circumstance that makes for admission is to be poor, afflicted with cancer, and to come with a recommendation from a physician.

4. The Home is a free home. The patient is welcomed to whatever benefits the Home can supply.

5. There are at present about twenty patients in the Home, so the resources are far from being taxed.

In an institution of this kind, the mortality is naturally high. Many defer their application for admission until they are almost at the threshold of death. While the sisters in charge have no intention of refusing patients in such extremity, they are conscious of the fact that to make transfer of a sick person when the end is near often causes fatal hemorrhage. It is part of the purpose of the Home to prepare patients to meet what is beyond with hope and calm. For this reason they have emphasized their willingness to receive cancerous poor people who have a fair expectancy of living on for a time. Often enough, when cancer is diagnosed in the case of a patient who is poor, it will have reached a stage not amenable to resist remedial care. Such cases would be considered as deserving of attention at the hands of the Servants of Relief for Incurable Cancer.

The attention of physicians of the Northwest is invited to the service offered at Our Lady of Good Counsel Free Home. Such an institution in our community cannot but bring to us all a better sense of brotherhood, a finer and more sensitive compassion for the needy and afflicted. Nathaniel Hawthorne often expressed such sentiments in his writings. From his youngest child, his favorite daughter—Rose Hawthorne Lathrop—we have had a forceful expression of the ideal in application. And the home recently established in Saint Paul is a memorial and a continuation of her work.

TUBERCULOSIS ON THE INCREASE

Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*, called attention to the threat of an increase in tuberculosis in this country in a series of talks given in the Twin Cities before various groups including the Minnesota Education Association, and the Minnesota Public Health Association at their annual conventions in October. His talks here were a part of the Christmas Seal educational program, preliminary to the opening of the 36th annual Seal Sale.

"When we examine the death rate of the nations at war abroad, we find that the one rate that is steadily rising is tuberculosis," said Dr. Fishbein. "Among the recruits examined by our army in this war the rate for tuberculosis rejection is less than half of what it was in World War I, showing that the nation as a whole has made tremendous advancement in overcoming this disease. This has been brought about by the extensive examinations of great numbers of young boys and girls, using the tuberculin test and the x-ray examinations and giving opportunity for sanatorium treatment and preventorium care to those needing it."

A warning that it will take the greatest effort possible to hold tuberculosis in check in this country is sounded by President Roosevelt in endorsing the Christmas Seal Campaign, President Roosevelt said:

"The unholy alliance between war and disease is particularly powerful in the case of tuberculosis. Tuberculosis has increased in every past war. The disease is increasing alarmingly in many warring European and Asiatic countries.

"In the United States tuberculosis is now at the low-

est rate in our history. But, to hold the disease in check during wartime will demand the greatest effort possible on the part of the people, the medical profession, the tuberculosis associations and the official health departments. Coöperation of all people in the fight against tuberculosis is imperative.

"The tuberculosis associations are well under way in their intensified and expanded wartime campaign. I have full confidence that the American people will generously add the purchase of Christmas Seals, the main support of the National Tuberculosis Association and its seventeen hundred affiliated associations, to their many other wartime activities."

The latest authentic figures on the increase of tuberculosis in certain European countries and Canada compiled by the National Tuberculosis Association have just been released through the Minnesota Public Health Association. They are as follows:

"In England and Wales, between 1939 and 1941, deaths from all forms of tuberculosis increased 12 per cent. This increase is twice as high as that which occurred between 1914 and 1916.

"In Scotland, between 1939 and 1941, all tuberculosis deaths increased 18 per cent.

"In Paris, during the first six months of 1941, tuberculosis deaths increased 10 per cent over the deaths from the disease in the first half of 1939. The number of food ration cards, issued in the fall of 1940, points out a decrease of 14 per cent in the city's population since 1936, thus making the increase in tuberculosis deaths more significant.

"According to the Canadian Tuberculosis Association, the tuberculosis death rate in 1941 increased five per cent over the 1940 rate, the first appreciable increase in deaths from the disease in that country in fifteen years.

"Unconfirmed but frequent reports from Germany emphasize a pronounced recent increase in tuberculosis, diphtheria and scarlet fever, but no detailed reports signed by accredited physicians or statisticians covering vital statistics in Germany for the last few years are available.

"Reports of alarming increases in the disease in China, Greece, The Occupied Low Countries and Poland have been received in this country, but no exact figures are available. No significant reports on tuberculosis have been received from Russia, Italy or Finland."

OBSTETRIC CARE FOR WIVES OF ENLISTED MEN IN MINNESOTA—A CORRECTION

Physicians are notified that funds are not available to the State Board of Health for payment for medical and hospital obstetric and pediatric care needed by the wives and infants of enlisted men in the military services. It is true that, as announced on page 945 of the November issue of MINNESOTA MEDICINE, there was a small Federal appropriation available for this purpose. It is also true that the State Board of Health requested an allotment of these funds for use in Minnesota. However, the United States Children's Bureau recently notified the State Board of Health that the Federal appropriation was exhausted in the first twenty-two States submitting approved plans for the use of the funds. Therefore, the program will not become effective in Minnesota unless the Congress passes a bill now under consideration. This bill, which is known in the Senate as S-2738 and in the House of Representatives

as HR-7503, is intended to provide these needed funds. Physicians are referred to page 47 of the September 5, 1942, issue of the *Journal of the American Medical Association* for detailed information on this bill.

In replying to the State Board of Health request for these funds, the United States Children's Bureau disapproved the Minnesota plan for administering the funds because it required investigation of financial need for assistance. The United States Children's Bureau regards this program as a replacement of a governmental service ordinarily provided by the Army and Navy in peacetime but impossible of maintenance during the war. This new aspect of the program, which was not made clear at the time it was originally presented in Minnesota, provides that the patient and the physician make joint application for payment for necessary medical and hospital services. Under this plan the primary responsibility for decision as to who shall receive the benefit of the funds will rest with the physician.

This new aspect of the program is being studied by the special committee appointed by the Council of the Minnesota State Medical Association. The recommendations of this committee will be presented to the Council at the first opportunity so that Minnesota may be prepared to act promptly in the event the bill before Congress is passed and the Federal funds become available.

In the meantime, physicians are advised to refer patients in need of assistance to County Welfare Boards and to local Red Cross Chapters.

EDITOR'S NOTE: The above statement by Dr. Viktor O. Wilson, Director of the Division of Child Hygiene of the Minnesota Department of Health, presents the present status of Federal provision for obstetrical care for the wives of enlisted men as applied to Minnesota and corrects the statement made on page 945 of the November number of MINNESOTA MEDICINE to the effect that funds were at present available in Minnesota for this purpose.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the

Minnesota State Medical Association
George Earl, M.D., Chairman

CONFERENCE ACTS TO PROTECT MEDICAL LICENSURE

Representatives of six state medical associations in this area met in Saint Paul, November 8, and agreed by formal resolution that "under no circumstances should existing standards for medical licensure be lowered."

This important action came as a result of suggestions arising out of the war emergency that licensure requirements in the states be relaxed and that, for the period of the war, men whose training and background does not measure up to current standards, should be licensed to practice in the place of men who have gone into the armed services.

The conferees rejected this suggestion on two accounts, first, because lowering standards will gravely lower the quality of medical service now and in the future and destroy, out-of-hand, accomplishments that have taken fifty years to build; second, because reports from all six states represented revealed no acute shortage of physicians in this region.

Adopts Name

The conference which took this important action formally constituted itself as the "North Central Medical Conference" at this meeting and agreed to meet at least annually, oftener at call, in Saint Paul.

The occasion marked a revival of the old Northwest Regional Conference which lost its character as a conference of this region and became, eventually, The National Conference on Medical Service which now meets annually in Chicago.

Membership Limited

States to be represented in the new association will be limited to Minnesota, Iowa, Wisconsin, North Dakota, South Dakota and Nebraska. Dr. W. L. Burnap of Fergus Falls act-

ed as chairman of the first conference. Officers for next year will be Dr. R. G. Arveson of Fred-
eric, Wisconsin, President, and Mr. R. R. Ros-
sell, Executive Secretary of the Minnesota State
Medical Association, as Secretary.

Procurement and Assignment has operated ef-
fectively in all six states, these reports revealed,
to retain essential men and to avoid stripping any
community of all medical service. Plans for fu-
ture recruiting have been carefully made and
sources of additional medical officers have been
located from communities where they can still be
spared.

Closer Contact Needed

Representatives generally expressed awareness
of the wartime danger of hasty social legislation
in Washington. Radical expansions of the so-
cial security laws and precipitate reorganizations
of the public health service already threaten in
the name of the emergency. All voiced a need
for closer contact with Congress and the federal
agencies so as to be informed quickly upon pro-
posals which might seriously affect medicine.

In many cases, such proposals are not legisla-
tive at all. They are regulations coming out of
the Washington bureaus, regulations which
might readily be altered for the better protection
of the sick if information about them were avail-
able while they were in the making.

Story Would Be Different

There is, for instance, the regulation which
calls for everybody, including physicians, to turn
in all but five tires, including the extra pair of
snow tires which nearly all medical men who
must drive in all kinds of weather and roads pos-
sess, or use them in place of the two regular tires
for the period of their usefulness. Much effort
has been expended to secure a relaxation of that
ruling for physicians but so far without avail.
If it had been possible to present the case to the
Office of Price Administration before, not after,

the regulation had been made, the story would have unquestionably been different.

There is also the regulation requiring a physician's prescription for the purchase of ordinary rubbing alcohol which might have been avoided, perhaps, if the effect had been explained in advance to Washington rationers. The good to be secured from this sort of prohibition is small, at best, and the penalty exacted in terms of the hard-pressed physicians' time is wholly out of proportion. One of the best ways to meet the so-called doctor shortage is surely to conserve the time of the practitioner at home so that nothing nonessential will keep him from serving his people.

Committee Appointed

The question of how the Washington situation is to be met was discussed from many points of view and the Conference eventually decided, by resolution, to appoint a committee which will "facilitate and coördinate the opinions expressed concerning legislative and other matters in Washington." On this Committee are Drs. J. D. McCarthy of Nebraska, R. E. Bernard of Iowa, L. W. Larson of North Dakota, C. A. Dawson of Wisconsin, C. E. Sherwood of South Dakota, and A. W. Adson of Minnesota.

PREPAYMENT PLANS DISCUSSED

Procurement and Assignment and the much head-lined shortage of doctors occupied the major part of the time of medical secretaries who attended the annual Secretaries' Conference in Chicago in November.

Medical Service plans highlighted the second day's program, however, and here, with reports before them from many parts of the country, the secretaries were impressed again with the fact that no plan anywhere has yet proved itself to be the answer to the cost problems of medicine.

Massachusetts has now joined the list of states, including New York, Pennsylvania, Michigan, California and others who have embarked upon pre-payment or indemnity plans sponsored by medical societies.

These societies are undoubtedly piling up invaluable experience out of which some day may develop workable plans for insurance against costs of medical care.

Partial Coverage Preferred

So far, however, not one of them can be said to have achieved an unqualified success, either

from the standpoint of the public or the physicians. Full coverage for all medical needs was especially revealed to be almost everywhere unsuccessful. It runs afoul of the old hurdle—if premiums are low enough to be attractive to the public, they are not high enough to be financially sound.

Partial coverage, for surgical services only, is now regarded by nearly all as preferable. Lower premiums are possible with this coverage and control is simpler.

Enabling Act Necessary

It was pointed out, with emphasis, to all states and societies who contemplate such plans, that special enabling acts are essential. This is insurance, even though of the nonprofit type, and physicians, themselves, must assume no responsibility not clearly protected by law.

They must also make very certain that no plan for any type of coverage is made which links or submerges the doctor with the hospital in management or organization. Experience has made it very clear that any plan for medical care must be run by the physicians as a sponsoring organization and furthermore, actual administration of the plan must be in the hands of a physician.

In any case, nothing came out of the Chicago Conference which would warrant any immediate change in the watchful waiting policy established by the Minnesota State Medical Association with regard to sickness insurance plans in Minnesota.

The need for experimentation is not acute in Minnesota and the penalty might well be loss of funds and prestige that would greatly impede future constructive action by the Association.

THOSE PERSUASIVE BRITISHERS

English physicians are talking about extensive expansions of their National Health Insurance System after the war.

The report of a commission appointed by the British Medical Association on postwar planning, published in the current issue of *Medical Care*, looks forward to a "comprehensive national health policy" which will correct the haphazard distribution of functions among national and local governments and add consultant, specialist and hospital services to insurance benefits. If the report is adopted, it will extend benefits to an estimated 90 per cent of the population.

Articles by Viscount Dawson of Penn and Sir Frederick Menzies, Chief Medical Officer of the

London County Council, are reprinted with the report in this issue to show what prominent British medical men are thinking about in connection with medical services of the future in Britain. These men are writing for Britain about British conditions but their persuasiveness makes especially apt the warning by the late Dr. S. S. Goldwater of New York on the possible effect of these English reports upon American readers.

Said Dr. Goldwater:

"What I have to say is not really a criticism but a friendly admonition that the Editor of *Medical Care* should not permit himself to fall victim to the charm of British essayists. Great Britain is fortunate in having so many distinguished members of the medical profession giving heed to medical-economic problems, but I have yet to meet a Britisher, however distinguished, however charming personally, however cultivated in science and the arts, and however masterly a writer, who is competent to write a medical ticket for the United States.

"I think we would do well to emulate the studious attitude and polished style of the English medical economic essayists while carefully avoiding any attempt to fit their highly specialized formulæ to our different proportions and conditions."

NO QUININE

Among the wartime shortages discussed in Chicago was the lack of quinine. The situation has become very serious as everybody who has read the story of Bataan and Corregidor knows. The result in terms of supplies at home is that no quinine may be prescribed at all except as an anti-malarial agent or in combination with urea-hydrochloride. Pharmacists have been required to turn in their supplies of quinine regardless of age, quantity or nature. They have been permitted to retain only enough quinine sulphate of hydrochloride to meet current needs. Physicians are urged to keep this fact in mind and manage without it.

NOT A LAW

By error, the bill known as the Tolan Bill, committing chiropractors to treat injured federal employees under the United States Compensation Act, was referred to in this section of the November issue of MINNESOTA MEDICINE as a law, whereas the bill has not yet passed the House of Representatives, so it has been reported favorably out of committee. A comparable bill committing the Army Medical Corps to appoint osteopaths to internships in Army hospitals did become law at the last session, however, and both are examples of the need for watchfulness in Washington.

NEW TEST IMPROVES OPERATION FOR SCIATICA

A new test that tells more exactly the spot for operation on the back in cases of sciatica and low back pain is reported by Dr. Walter E. Dandy, of Johns Hopkins Hospital (*Jour. AMA*, Oct. 24).

In almost all cases of sciatica with low backache, Dr. Dandy points out, the trouble is due to rupture or defect of an intervertebral disk, the layer of fibro-cartilage between the bodies of the vertebrae. Treatment by operation is "absolutely safe and a cure is practically assured," he states.

The diagnosis, he believes, can be made solely on the patient's story of attacks of sciatica and low backache occurring after a relatively trivial injury, such as a lift, bend or strain, with the pain made worse during attacks by coughing or sneezing. In almost all cases the affected disks are at the fourth or fifth lumbar vertebra.

In order to determine the location more precisely, Dr. Dandy says that during the operation the surgeon should push the spines of the fourth and fifth spinous processes downward and determine the mobility of each vertebra. The affected disk will be where the greater movement is shown because the defective disk has weakened the spinal column locally and this causes the mobility.

This free play at the disk is responsible for the intensification of the pain by coughing or sneezing and if the patient can stiffen his back before the cough or sneeze, the pain will be ameliorated.—*Science News Letter*, November 28, 1942.

BALKAN PLANT GIVES MORE EFFECTIVE DRUG

A crystalline substance from a Balkan digitalis plant, or foxglove, has proved more effective in treating heart disease than the digitalis in common use, Dr. Francis E. Chamberlain and Dr. Maurice Sokolow, of the University of California Hospital, report.

The substance is called cedilanid and is found only in *Digitalis lanata*. Terming it the "first superior substitute for digitalis yet to be found," the California physicians say that it produces the same effect as digitalis and acts more rapidly. In many cases, they report, patients were benefited within ten to twenty minutes after being given cedilanid. It may be given by mouth or by injection into a vein. Their report states that this drug is now on the market and readily available to physicians.—*Science News Letter*, November 28, 1942.

TUBERCULOSIS IN WARTIME

Control of tuberculosis under conditions of war challenges all available resources. The medical history of World War I reveals to us how mortality rates for tuberculosis increased greatly during the war and some years thereafter, especially in Europe. The massing of armed forces for training purposes, mixing individuals from areas of high tuberculosis prevalence with those from areas relatively free of the disease, confronts the military establishment as one problem in tuberculosis control. The concentration of families of industrial workers in defense and cantonment areas, under unhygienic living conditions where sanitation is limited or absent, presents another terrific public health problem. Unless national efforts are directed towards combating these specific factors in the tuberculosis problem, we may well expect an upward trend rather soon in the tuberculosis mortality curve for the United States which has had a beautiful downward trend from 114 per 100,000 per year in 1920 to 45.9 in 1940.—HERMAN E. HILLEBOE, P. A. Surgeon-in-charge, Tuberculosis Control, States Relations Division, United States Public Health Service.

PHYSICAL EXAMINATIONS IN EMPLOYMENT

Physical examinations for employment are of considerable value in industry. Often these examinations must be done quickly, but with care and accurate observations. The clothing is all removed and a record is made of age, weight, height, race and all abnormalities for a future reference.

Some unions, to my knowledge, allow the employer, at his own discretion, to discharge a new workman during the initial fifteen-day period, but thereafter an employe's priority is established and he must not be discharged without the consent of the union. In other words, a man once accepted might be retained indefinitely. Countless controversies arise from injuries associated with or superimposed upon previous ailments. In observing and examining the man, it is therefore well to reject the potential risk.

Previous Injuries Noted

On examination of the head and neck we notice among other things previous injuries. The eyes should be carefully checked. It has so happened, but rarely that an individual has claimed full compensation for the loss of partial eyesight whereas the original vision was not normal. People with poor vision or one sightless eye are added risks, as are men with defective hearing. The teeth, if infected, may be a hazard—for example, one person with a supposedly injured back was paid compensation. The removal of an abscessed tooth with prompt recovery resulted in the discovery of a wrong history. The chest should be observed for empyema scars and the sequelae. Breathing is also noted. In the heart examination we are particularly watchful for the diseased heart and rapid pulse, the extreme hypertension and valvular diseases. Wassermann tests are desirable. Reflexes often give important clues. It is known, arthritic hearts at times terminate in bacterial endocarditis and if associated with an injury would cause considerable litigation. We

have had three cases of bacterial endocarditis complicating injuries. One patient recovered through the use of sulfadiazine. Once a heart case is employed you usually place them at work as best possible. To create harmony for all, in our plant at present, we have been obliged to place at work two old employes, one an extreme hypertensive heart case and another individual who has a very rapid pulse with an associated heart involvement. They are given light jobs, but are decided risks at the best. In considering the circulatory system we also feel people with advanced varicosities and ulcers should be rejected. These workers have caused us considerable trouble.

The abdomen is observed for long scars and associated incisional hernias. A short history may or may not reveal an ulcer ailment. We have had three workers with no particular previous history, perforate their duodenal ulcers at work. They all recovered from surgery, but one maintained an injury caused it. The urine examination, of course, is of value.

In examining for hernias, a careful palpation is done. Markings for a truss may warn you of a healed hernia from injection treatment. It is our opinion these injections hold for only a reasonable time. We have encountered in industry strangulated ventral, intra-abdominal, femoral and inguinal hernias. They are all likely compensable.

In respect to the genital system we reject acute gonorrhea and undescended testicles. They are definite hazards. One undescended testicle in our plant terminated in sarcoma. Hydroceles and varicoceles are rejected if severe, otherwise accepted for work. The muscular system is observed for atrophies, pain or restricted motion. Many times we notice sore backs by having the individual touch the floor with both hands. We also believe the long slender back or the extremely short stubby one is more prone to injury on heavy lifting. The glandular system is palpated

In Memoriam

FRANK CLINTON ANDRUS

Dr. Frank Andrus died of coronary thrombosis on November 14, 1942. His death was an unexpected blow to his family and friends since he was only thirty-five years of age and was just entering upon a brilliant career in pathology.

Dr. Andrus received his M.B. degree from the University of Minnesota in June, 1932, and his M.D. degree in June, 1933, after an internship at the Minneapolis General Hospital. He then spent one year as a Fellow in Medicine at the Minneapolis General Hospital and the subsequent three years as a Fellow in Pathology at the University of Minnesota. In July, 1937, he was appointed Senior Instructor in Pathology at Ohio State University. In April, 1938, he was appointed director of the laboratory of the Springfield City Hospital but retained his connection with the Department of Pathology at Ohio State University. In September, 1939, he was made director of the laboratory of the Minneapolis General Hospital, and was given the rank of Assistant Professor in the Department of Pathology at the University of Minnesota.

On September 3, 1942, he joined the Army with the rank of Captain in the Medical Corps. He was stationed for a short time at the Army Medical School at Washington, and on October 30 he began his duties as Chief of the Laboratory Section at the Percy Jones General Hospital at Battle Creek, Michigan.

Dr. Andrus was highly regarded by his friends and associates. His training in internal medicine made him especially valuable as a consultant for his clinical colleagues. His keen intelligence and sense of humor will long be remembered by those who had the privilege of his friendship.

Dr. Andrus is survived by his wife and two young children. The physicians of Minnesota extend to Mrs. Andrus their deep sympathy.

—E. T. BELL.

ELMER JULIUS EKLUND

Dr. Elmer J. Eklund died suddenly at his home in Norwood, Minnesota, November 4, 1942, in his fifty-seventh year, having practiced in that locality for thirty-five years.

He was born in Minneapolis December 17, 1884, the son of Gustav Eklund and Louisa Marie Truwe Eklund. He attended Stevens Seminary in Glencoe and after graduating in 1902 entered the University of Minnesota. Here he received his medical degree in 1907 and then served as intern at Saint Joseph's Hospital in Saint Paul.

In 1908 Dr. Eklund began practice in Young America, marrying Elizabeth B. Collins that same year. He moved to Norwood in 1917 where he had since practiced except for a trip to Berlin and Vienna in 1934 for postgraduate work.

Dr. Eklund was always an active individual. He was

mayor of Young America for two years and was Carver County coroner for four years. He was a director of the Carver County Telephone Company at one time, and Health Officer for Norwood and several nearby townships. He was also company surgeon for the Chicago, Milwaukee and the Minneapolis and St. Louis railways.

During World War I he was a member of the Local Draft Board. He was also a member of the Scott-Carver County Medical Society and the Minnesota State and American Medical Associations, the A. F. and A. M. 142, the R. A. M. at Glencoe, the Knights Templar at Hutchinson and the Zuhrah Shrine of Minneapolis.

His hobbies included reading and travel. As medical adviser to many in his community and as a friend he was much beloved and esteemed. His wife and two daughters, Mary Louise and Jeanette (Mrs. Robert Yount) survive him.

ARTHUR DOUGLASS HIRSCHFELDER

With the passing of Arthur Douglass Hirschfelder, the University of Minnesota lost the man on whom, in 1913, it bestowed for the first time the title of "Professor and Director of the Department of Pharmacology." He was called to organize this new department at the age of 34. Thus, he was one of the youngest men ever appointed in charge of a department in the University of Minnesota Medical School. After occupying this chair for more than twenty-nine years, Dr. Hirschfelder died, at his home in Minneapolis, on October 11, 1942. The cause of his death was coronary sclerosis.

Dr. Hirschfelder was born in San Francisco on September 29, 1879. He was the only son of Dr. Joseph Oakland Hirschfelder, Professor of Clinical Medicine in the Cooper Medical College of San Francisco (now Stanford University). His father had studied medicine in Leipzig under such masters as Carl Ludwig, the celebrated German physiologist. With this heritage, it was only natural that the son should elect to study medicine. After obtaining his B.S. degree from the University of California in 1897 as its youngest graduate, he began the study of medicine in Munich and Heidelberg under Büchli, Kühne, and Otto Cohnheim. Later he returned to this country and entered the Johns Hopkins School of Medicine, from which he obtained his M.D. degree in 1903. Then there followed a year as intern under Osler in the Johns Hopkins Hospital, and a second year as Resident in Medicine at the San Francisco General Hospital and Assistant in Medicine, Cooper Medical College, under his father. In 1905 he returned to Hopkins to organize and direct the Physiological Laboratory of the Medical Clinic under Dr. Llewellys F. Barker, the first pure research position in clinical medicine in the United States. He remained at Johns Hopkins until he accepted the Chair in Pharmacology at the University of Minnesota.

His interest in medical research, he admitted on several occasions, was due largely to the influence of three men. These were his close friends, Jacques Loeb, whom he first met in 1899, and Arthur S. Loevenhart, his classmate at Hopkins and later Professor of Phar-

Ciba Research
Presents A New Compound
PRIVINE
 HYDROCHLORIDE

YEARs of laboratory and clinical study have produced this effective vasoconstrictor which will provide more prompt and prolonged relief from nasal congestion. PRIVINE* Hydrochloride action outlasts in most cases the effect of other vasoactive fluids.

Clinical solutions are strongly buffered to resist alkaline pathological secretion and to preserve a normal, slightly acid reaction of the nasal mucosa. Their isotonicity and the reaction of the solution (pH—6.2) are specifically recommended for the restoration and preservation of the ciliary activity and the normal physiology of mucous membranes.

PRIVINE HYDROCHLORIDE is a most economical and efficient nasal medication. Issued as an 0.1% solution, bottles of 1 oz. with dropper. An 0.05% solution is available especially for children.

Pharmaceutical Products, Inc.
 SUMMIT, NEW JERSEY

macology at Wisconsin, and, last but not least, his father. It was the encouragement of the latter that started him on his study of the circulation at the San Francisco General Hospital.

His earliest contributions to the medical literature were on the cardiac arrhythmias and the venous pulse. These studies culminated in his well-received book, "Diseases of the Heart and Aorta," the first edition of which appeared in 1910. He continued this work after coming to Minnesota. However, he will also be remembered by his other work at Minnesota such as his introduction of saligenin as a local anesthetic, his studies on the physiology of the kidney, on certain phases of the pharmacology of barbitol hypnotics, magnesium, and calcium, and among his graduate students especially, by his contributions on, and interest in, antiseptics and chemotherapy. It was his fondest desire to dedicate his laboratory to the study of the application of chemistry to pharmacology and especially to the therapy of infectious diseases.

He made a number of contributions to the war effort during the first World War. With William Moore he collaborated in a National Research Council project on a study of louse repellents in clothing. A school for pharmacists' mates of the United States Navy was organized at the University largely due to his effort. Finally, he was called as pharmacologist to the Johns Hopkins Research Unit of the Chemical Warfare Service in the laboratory of Professor E. Emmet Reid in Baltimore. After the war he continued as a member of the Board of Consultants, Chemical Warfare Service, Edgewood Arsenal, for a number of years.

No account of Dr. Hirschfelder would be complete without mention of his role as a teacher. This, too, was a part of his University life that he thoroughly enjoyed. He had such a tremendous grasp of the literature, and he was so interested in discoveries and personalities, that, in his lectures, he would occasionally digress extensively, to the dismay of some students and to the great joy of many others; nevertheless, he was always interesting and stimulating. The same was true of his relations with his graduate students. In his earlier years at Minnesota hardly a day would pass that he did not give each student some new idea for his research. In later years his Seminars on the History of Pharmacology were most interesting and informative.

He was well liked by the members of his classes, and he liked them. Many a student in scholastic difficulties owed his continuation in medical school and ultimate graduation to Dr. Hirschfelder's intercession. These tasks, on the part of "The Chief," of helping students in trouble were among his most satisfying accomplishments. He will be loved and missed for many years to come.

RAYMOND N. BIETER.

ANDREAS P. LOMMEN

Dr. A. P. Lommen of Lanesboro spent the last few weeks of his life at Veterans' Hospital at Wood, Wisconsin. He passed away September 16, 1942, at that place and burial was in Lanesboro. The cause of his

MINNESOTA MEDICINE

death was given as cerebral thrombosis with heart disease, coronary arteriosclerosis with myocardial damage and insufficiency as contributory. He was 75 years of age.

Dr. Lommen was born in Spring Grove, Minnesota, on May 10, 1867, the son of Peter Lommen and Maria Arnston, both of Norwegian birth. His wife was Stella Johnson of Newburg, Minnesota, and there are three children: Helen Lommen of Lanesboro; Robert Lommen, electrical engineer in Milwaukee; Paul Lommen, attorney in Lanesboro.

His education included grade school in Spring Grove, Gales College of Galesville, Wisconsin, for two years, and the University of Minnesota for one year before he entered the University of Minnesota Medical School where he obtained his medical degree on June 6, 1895. He taught rural school for one year, 1890-1891. He was licensed in Minnesota by examination on June 11, 1895.

Dr. Lommen was a member of the Lutheran church, I.O.O.F., Yeoman Lodge, Sons of Norway, and American Legion. He had held office as county physician, county health officer, chairman of the board of education, and was captain in the medical corps during the first World War. He was also mayor of Lanesboro preceding Mayor Teman Thompson. He was a member of the Fillmore-Houston County Medical Society and the Minnesota State and American medical associations.

Patients with Long-Standing Ptosia

A

B

**Are Grateful
For Relief

Individually
Designed
SPENCER
SUPPORT**

A: Patient with extreme case of enteroptosis. Probably has movable kidney, also.

B: Same patient in the Spencer that was designed especially for her. Note support given — and improvement in posture.

A large number of doctors have remarked the immediate favorable reaction of patients with long-standing ptosis to a Spencer Support. This is because the Spencer has been designed especially for patient *after* a study of patient's posture habits has been made. Thus our designers are enabled to create a support that will improve posture.

A Spencer Support gently lifts sagging organs, while allowing freedom at upper abdomen. This, plus posture improvement, aids digestion, elimination and improves circulation of blood through abdomen. Appetite usually improves. The patient's improved posture induces better breathing, a feeling of well-being and a happier outlook.

Every Spencer is individually designed for patient, of non-elastic material. Hence, the support it provides is constant, and the Spencer can be—and IS—guaranteed NEVER to lose its shape. (Spencers have never been made to *stretch to fit*; they have always been *designed to fit*.) Why prescribe a support that soon loses its shape and becomes useless before worn out? Spencers are light, flexible, durable, easily laundered.

For service look in telephone book under "Spencer Corsetiere" or write direct to us.

REPORTS and ANNOUNCEMENTS

MEDICAL BROADCAST FOR DECEMBER

The Minnesota State Medical Association broadcasts weekly at 10:15 o'clock every Saturday morning over Station WCCO, Minneapolis and Saint Paul, and at 11:30 o'clock over Station WLB, University of Minnesota. Speaker: William A. O'Brien, M.D., Director of Postgraduate Medical Education, Medical School, University of Minnesota.

December 5—Senescence and Senility

December 12—Special Health Problems of Middle and Late Life

December 19—Care and Management of Adults

December 26—Dental Replacements

COURSE IN OCCUPATIONAL DERMATOSES

A combined lecture and demonstration course in Occupational Dermatoses will be conducted in Chicago, beginning January 11, 1943, by Dr. Louis Schwartz, Chief of the Dermatoses Investigations Section of the U. S. Public Health Service of Bethesda, Maryland. The teaching period will cover two weeks, the first of which will be devoted to lectures and demonstrations, and the second to plant visits. Dermatologists, industrial physicians and others interested in the course should communicate with Dr. Edward A. Oliver, 55 East Washington Street, Chicago, Illinois.

No limit will be placed upon enrollment for the lectures, but the visits to the plants will be limited to twenty-four enrollees. No fees will be charged.

THE FIFTH ANNUAL FORUM ON ALLERGY

This international postgraduate society will meet in the Hotel Statler in Cleveland, Ohio, the week end of January 9 and 10, 1943. This Forum will offer in most intensive presentation both the new and the old in Allergy. The meeting will be characterized by its use of all the various types of instruction. Formal lectures, special talks, dry clinics, study groups, moving pictures, Kodachromes, panel discussions, ending with an "Information on Allergy, Please," will all be used to teach the physicians of the United States and Canada. Not only will specialists in this new field of Internal Medicine gather but also those whose interests are in allied fields of medicine will be welcome, for in wartime every physician is called upon to advise and treat allergic patients. This is especially true of those in Internal Medicine, Diseases of Children, Diseases of the Skin, Diseases of the Eye, Diseases of the Nose and Throat, as well as those engaged in basic research in Immunology. A course in Immunology as it applies to Allergy will be given the week before by Dr. Eckers to a limited number of physicians and associates. Any physician interested in either or both of the foregoing is invited to write Dr. Jonathan Forman, 956 Bryden

Road, Columbus, Ohio, for copies of the printed program and registration blanks.

Among the fifty-eight Allergists participating in the program are most of the leaders in this field including Fred Wittich, M.D., of Minneapolis. Arthur Coca of New York will receive the Forum's Gold Medal and will give the annual Forum lecture on Sunday afternoon.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular meeting of the Minnesota Society of Neurology and Psychiatry was held at the Town and Country Club, Saint Paul, Tuesday evening, November 10, 1942. Following dinner at 6:30 o'clock, the program for the evening included papers on "Tetanus" by Dr. A. B. Baker and "Sequelæ in Equine Encephalomyelitis" by Dr. H. H. Noran (by invitation).

RED RIVER VALLEY MEDICAL SOCIETY

Thirty-five physicians and their wives were in attendance at the fall meeting of the Red River Valley Medical Society, held in Thief River Falls, October 27. Special guest of the evening was Dr. W. L. Bur-nap, delegate from the State Medical Association.

The program included presentation of a paper by Dr. Edward Bratrud of Thief River Falls on "Kidney Hemorrhages" and one by Dr. Charles G. Uhley of Crookston, on "Modern Treatment of Burns."

Wives of the physicians attending the meeting were entertained during the evening at the home of Mrs. H. K. Helseth.

RENNVILLE COUNTY MEDICAL SOCIETY

The annual meeting of the Renville County Medical Society was held in Olivia, Monday, November 9, in the high school building, where dinner was served by members of the Home Economics class.

Speaker of the evening was Rev. Fr. Carl Wohlford of Clara City, missionary in India for seventeen years, who told of the customs and castes in India.

Dr. James A. Cosgriff of Olivia was elected president of the Society for the coming year.

WASHINGTON COUNTY SOCIETY

The Washington County Medical Society held its regular monthly meeting Tuesday evening, November 10, in Stillwater.

Dr. Everett K. Geer of Saint Paul spoke on "Chest X-Ray Values and Diagnosis." He interpreted thirty-eight radiographs taken of positive Mantoux test reactors at the Stillwater High School, where the test was made on October 13. A discussion hour followed in which Dr. Geer answered questions concerning the subject presented in his talk.

WOMAN'S AUXILIARY

MRS. RAYMOND J. JOSEWSKI, *President*

Stillwater, Minnesota

MRS. W. H. RUCKER, *Publicity Chairman*

Minneapolis, Minnesota

East Central

The East Central Medical Auxiliary met in Cambridge, Minnesota, October 21 with Mrs. D. E. McBroom. Mrs. A. B. Roehlke, president and Mrs. W. P. Gardner, *Hygeia* chairman, gave reports. There were eleven members and three guests present.

Nicollet-Le Sueur

Mrs. Hobart C. Johnson of Nicollet-Le Sueur Auxiliary reports that the group's last meeting was the September Public Relations tea at St. Peter, Minnesota.

Each member presented a vase to the Community Hospital in St. Peter and, from money previously earned, decided to purchase pen sets with chains attached for use at the hospital.

Park Region

The Park Region Medical Auxiliary members were the guests of the Medical Society at their regular dinner meeting at the River Inn, Fergus Falls, October 14, 1942.

Members had the pleasure of hearing Dr. Hall deliver an address covering many interesting features

of his recent stay in England with an American medical unit there.

A short business and social meeting then was held at the home of Mrs. W. O. B. Nelson. At this time, Mrs. A. C. Baker gave her report of the State Meeting at Duluth. The president of the auxiliary, Mrs. A. J. Lewis, read the committee appointments for the year, which were as follows:

Ottertail Sanatorium.....
.....Mrs. C. A. Boline and Mrs. K. E. Bergquist
Hygeia.....Mrs. Theodore Satersmoen
Public Relations.....Mrs. A. C. Beker
Publicity.....Mrs. Frank Naegeli

Ramsey County

The Ramsey County Medical Auxiliary plans to continue regular meetings and follow, as closely as possible, the schedule of previous years, in this way keeping members united to carry on the very important philanthropic work planned.

The Red Cross Sewing and Surgical Dressing Unit meets once a week. This unit has been functioning all summer and has thousands of articles to its credit.

A large group belong to the Public Health Speakers' Bureau—for the Christmas Seal Drive, another group has charge of Christmas Seal booths for December 8 and the Ramsey County Auxiliary again, as for many years past, will send a committee to act as judges for the Tuberculosis Essay Contest, as well as to donate a trophy for the winner from Ramsey County.

Two new committees were added this year: (1) The

Euresol pro capillis

R 1 dram to 4 oz.
in a lotion or ointment
for dandruff, itching scalp
and falling hair.

Euresol, acetylresorcinol, is available in bottles containing 1 ounce.

EURESOL PRO CAPILLIS

Council Accepted

BILHUBER-KNOLL CORP. ORANGE, NEW JERSEY.

War Service Committee was appointed, to help whenever called upon at the Service Men's Club in Saint Paul. Ten dollars has been donated to this cause and used phonograph records are being collected. (2) The Sunshine Committee consists of members who will visit the sick members, write notes of condolence, send flowers and contact wives of doctors in the service of the armed forces.

The Medical and Surgical Committee of America is busy collecting used surgical instruments and supplies. The doctors have kindly set aside a room in the medical library for this activity.

The first meeting of the year was held at the home of Mrs. Arnold Schwyzer in Saint Paul with a large attendance. Mrs. R. J. Josewski, State Auxiliary President, spoke to the group, outlining the plans of State Auxiliary activities for the year.

Washington County

Washington County held its October meeting in Stillwater at the home of Mrs. R. J. Josewski, president of the State Medical Auxiliary. The most important measure passed by the group, over which Mrs. R. G. Johnson presided, was a vote placing *Hygeia* in sixteen of the county schools.

During the social hour which followed, a parting gift was given to Mrs. Russell Carlson who left Stillwater October 15 when Dr. Carlson entered military service.

INDUSTRIAL HEALTH

(Continued from Page 1008)

and if general enlargement is noticed, the applicant is rejected. One of our individuals of long employment had enlarged glands in the groin which was lympho granuloma inguinale. As a complication from injury this was denied.

Blond Workers Prone to Dermatitis

People with flat feet are apt to have repeated attacks of pain and discomfort on standing jobs. The blond or auburn type workers are more prone to severe dermatitis, as are the oily-skin employees on greasy jobs or the dry-skin individual on the jobs to aggravate the symptoms. The skin is observed also for color and its healthy appearance. We know also long scars over the long bones may be from previous osteomyelitis or plating. They are potential risks. Your contact informs you often of a careless, an alert, a dependable or a slow, dull worker. Your exchange communications often prewarn you of the malingerer.

A preview of many desirable findings for the incoming workman has been reviewed the importance of which has frequently been experienced by us. Among controversies arising from injuries, under our care, have been sarcomas developing in the injured soft tissue to the leg, superimposed on a fibrous warty growth of years' standing. We have seen three such cases. We have encountered a pathological fracture, a T. B. joint complicating with injury, a charcot joint with injury, numerous back complaints, more as recurrent trouble than actual acute involvements, and a number of injured ankylosed fingers where previous records saved on the permanent injury settlement. We have mentioned strangulated hernias of various types which are compensable, also the bleeding varicosities and slow-healing ulcers.

Careless workers and malingerers are positively undesirable employees. In hazardous employment, rejection of serious potential risks from industry, not only results in saving of time and expense for the employer, but also saves the workman and his family trying moments of anxiety and sorrow which might be their lot.

J. A. LOWE, M.D.

An area of 150,000 square miles, the Oriente of Ecuador and Peru, is believed to be the world's largest *unoccupied land* available for successful settlement and development.

Cook County

Graduate School of Medicine

(In Affiliation with Cook County Hospital)

Incorporated not for profit

ANNOUNCES CONTINUOUS COURSES

SURGERY—Two Weeks Intensive Course in Surgical Technique with practice on living tissue, every two weeks throughout the year. General Courses of One, Two, Three and Six Months; Clinical Courses; Special Courses.

MEDICINE—One Month Course in Electrocardiography and Heart Disease starting the first of every month, except December.

FRACTURES & TRAUMATIC SURGERY—Formal and Informal Courses.

GYNECOLOGY—Clinical and Diagnostic Courses.

OBSTETRICS—Formal and Informal Courses.

OTOLARYNGOLOGY—Clinical and Special Courses.

OPHTHALMOLOGY—Formal and Informal Clinical Courses.

ROENTGENOLOGY—Courses in X-ray Interpretation, Fluoroscopy, Deep X-ray Therapy every week.

UROLOGY—Two Weeks Course and One Month Course available every two weeks.

CYSTOSCOPY—Ten Day Practical Course every two weeks.

General, Intensive and Special Courses in All Branches of Medicine, Surgery and the Specialties.

TEACHING FACULTY — ATTENDING
STAFF OF COOK COUNTY HOSPITAL

Address: Registrar, 427 S. Honore St., Chicago, Ill.

OF GENERAL INTEREST

Dr. O. N. Bossingham of Lake Benton is now in Clarinda, Iowa, where he will remain for the duration of the war, having taken over the practice of his son, Dr. Earl N. Bossingham, who is in service in New Guinea.

* * *

Dr. E. V. Strand and Dr. J. H. Haines of Stillwater this year acted as judges of essays on "Tuberculosis" by Stillwater High School students. Dr. Strand and Dr. F. M. McCarten judged the Junior High School essays.

* * *

Dr. J. de J. Pemberton was re-elected president of the Mayo Clinic staff at the annual dinner held November 16. Dr. F. J. Heck was renamed secretary. Councilors are Dr. H. F. Helmholtz and Dr. B. R. Kirklin.

* * *

Dr. Lawrence J. Leonard of Minneapolis has opened offices in Columbia Heights. Dr. Leonard will continue to maintain his office at West Broadway and Oliver Avenues in North Minneapolis, dividing his time between the two communities.

* * *

At the Conference on Venereal Disease Control Needs in Wartime held at Hot Springs, Arkansas, October 21 to 24, under the auspices of the United

States Public Health Service, Dr. Arthur H. Sanford of Rochester presented a paper entitled "New Serologic Tests for Syphilis and Their Demonstrated Efficiency."

* * *

Dr. Charles P. Mannin was married to Miss Lucia Carole Bellinger of Atlanta, Georgia, on October 1, 1942 in Atlanta. Dr. Mannin, who has a fellowship in General Surgery at the Mayo Clinic, Rochester, Minnesota, has received a commission as Lieutenant (jg) in the Navy and has reported for duty at the Corona Naval Hospital, Corona, California.

* * *

Dr. Charles E. Lyght, professor of health and physical education at Carleton College, Northfield, and director of the College Health Service, has accepted a position with the National Tuberculosis Association, New York, as director of the Department of Health Education. He will assume his duties in New York soon after the first of the year.

* * *

Dr. Irvine McQuarrie, professor of pediatrics, University of Minnesota Medical School, delivered on November 3 and 4, three addresses in the twelfth Porter Lectureship in Medicine at the University of Kansas School of Medicine. Tuesday, November 3, he spoke at the Kansas City branch on, "Experiments

of Nature and the Advancement of Medical Knowledge." On November 4 he spoke at Lawrence on "Medical Experience in Besieged China," and that night again at Kansas City, on "Diseases of Adrenal Glands in Children." The Porter Lectureship is supported by a sum of money bequeathed to the School of Medicine of the University of Kansas in 1918 by Dr. J. L. Porter of Paola, Kansas. Besides the annual lectureship it provides a scholarship for a worthy student.

Dr. Jens Ohnstad, pioneer physician of McIntosh, completed thirty-nine years of service as physician in his community on October 7, 1942. In an interview published in the *McIntosh Times*, Dr. Ohnstad tells of his early experiences in the horse and buggy days, going back to his student days in the state medical school, which was then a part of Hamline University. Dr. Ohnstad has practiced continuously in McIntosh since his graduation from medical school with the exception of a short period spent in Minneapolis in perfecting his surgical technique. In 1918, Dr. Ohnstad built the city hospital in McIntosh complete with facilities for surgical and medical treatment. He has kept abreast of medical progress through postgraduate study and has been an active member of his local, county, state and national medical associations. The interview ends with the following tribute to Dr. Ohnstad's contribution to his community: "Dr. Ohnstad can be considered one of the finest of McIntosh citizens, and has given a broad, progressive, unselfish service toward the welfare of the city."

Physicians in Service

Dr. Russell E. Carlson of Stillwater is stationed at Fort O'Reilly General Hospital, Springfield, Missouri.

Dr. C. E. Stafford of Baudette reported for duty at Barnes General Hospital, Vancouver, Washington, in November. Dr. Stafford recently received word through Washington, D. C., that his parents, who are residents of the Phillipines, are now prisoners in a Japanese concentration camp, and are both well.

Dr. Hendrik Svien of Rochester, who was appointed

assistant surgeon with the rank of lieutenant in the United States Navy last spring, received his orders for active duty and reported at the naval medical center at Bethesda, Maryland, November 1.

Dr. R. A. Whitney of Cambridge is stationed at Fort Sam Houston in Texas. Dr. P. C. Peterson of Braham will take care of Dr. Whitney's practice during his absence.

Major S. B. Lovelady and Captain Louis D. Vaughn of Rochester have been assigned to the medical training battalion at Camp Grant, Illinois.

Dr. W. F. Muir of Graceville reported for duty at Camp Robinson, Arkansas, November 1. He has been commissioned a first lieutenant in the Army Air Corps.

Dr. C. H. Coombs of Bemidji reported for duty as assistant surgeon, with the rank of lieutenant, at the navy training base at Great Lakes, Illinois, November 1. Dr. R. W. Campbell of Cass Lake will take over the practice of Dr. Coombs for the duration of the war.

Dr. Charles A. Aling of Minneapolis received his commission of captain in the U. S. Army and reported for duty at Camp Berkeley, Texas, in November. Captain Aling's practice in Northeast Minneapolis will be taken over by Dr. Ruth Lundberg for the duration of the war.

Lieutenant Harold C. Freedman of Minneapolis, now at Gardner Field, California, has received promotion to a captaincy.

George Chase Christian Professorship

Material expansion of a program of research into the causes of cancer now under way at the University of Minnesota was made possible when the Board of Regents accepted a gift of \$5,500 a year, for five years, from the Citizens Aid Society of Minneapolis to support what will be known as the George Chase Christian Professorship in cancer research. It will be the first professorial chair in the University of Minnesota Medical School to be named for an individual.

On recommendation of Dean Harold S. Diehl and President W. C. Coffey, the Regents appointed to the post Dr. John J. Bittner, now associate director and vice president of the Board of Directors of the Roscoe B. Jackson Memorial Laboratory at Bar Harbor, Maine, of which institution Dr. Bittner has been a staff member since 1930.

Dr. Bittner will increase to three a team now composed of Drs. Maurice B. Visscher and Robert G. Green who are studying the etiology of mammary cancer in mice. Studies by Dr. Bittner have shown that young mice born to a high cancer strain mother are likely to develop cancer if nursed by the mother, whereas if taken from her and nursed by a mother from a low cancer strain they are quite likely to be cancer free. Three factors in the etiology of mouse cancer on which he and Drs. Green and Visscher have been working are that cancer is transferred by an agent in mother's milk, that mammary gland development is stimulated by estrogenic hormones, and the

likelihood that a virus agent is present in advance of the cancer development.

Dr. Bittner is credited with much important early work in this approach to the cancer problem. An experiment published by him in collaboration with Green and Visscher indicated that the agent of the milk of females of cancerous strains is a colloid of high molecular weight and may be a virus.

Dr. Bittner will move to Minneapolis with his family as soon as housing and laboratory arrangements can be made. Born in Meadville, Pa., in 1904, he was graduated from St. Stephens College in 1925 and in 1927 became a research assistant at the University of Michigan, receiving his Ph.D. degree there in 1930. He has won many research honors including the Alvarada Prize of the College of Physicians, Philadelphia. In 1940 he delivered the George Chase Christian lecture at the University of Minnesota. The Cancer Institute in the University Hospital is a memorial to the late Mr. Christian, and Mrs. Christian, a resident of Minneapolis, has encouraged the Citizens Aid Society in support of cancer research work for many years.

In the new Minnesota team Dr. Bittner will approach the cancer problem as a geneticist, Dr. Visscher as a physiologist, and Dr. Green as a bacteriologist with a special interest in viruses.

The author of this work was graduated from the old University of Minnesota College of Medicine and Surgery in 1907. Prior to that time his life had been one of unmitigated hardship and struggle. An Indiana orphan boy, he performed the most arduous manual labor he could get to do, merely to gain a living; later he worked in the fields, in a Colorado mine, in the villages of arid Kansas, and the bitter-cold streets of Minneapolis, to support himself while he studied first at Wabash College and then the University of Minnesota.

cation and Research at Rochester, he became the first male surgical assistant Dr. William J. Mayo ever had, after the retirement of Sister Joseph from that post. When he left the Mayo Foundation in 1916 he formed a copartnership at Fond du Lac which has been exceptionally successful and remains so.

His book, which is essentially a plea for the training and code of ethics which Dr. Smith believes should characterize the surgeon of today, is a scrupulously honest presentation by a highly skilled surgeon who has decided convictions as to how surgery should and should not be conducted. The author has not been content to piece together a series of mellowed reminiscences; he has attacked evil where he believes he has found it, and has been quick to bestow praise when he believes praise is merited. His book is forthright and valuable.

FOOD CHARTS: FOODS AS SOURCES OF THE DIETARY ESSENTIALS prepared by a joint Committee of the Council on Foods and Nutrition of the American Medical Association and of the Food and Nutrition Board of the National Research Council. Paper. Price 10 cents. Pp. 20. American Medical Association, Chicago, 1942.

Current interest in nutrition is at a high level and the subject merits all the attention which it is receiving. Information about the composition of foods now is on a quantitative basis. A forceful presentation of some facts about foods as sources of the dietary essentials is provided by the present illustrated essay, which has been prepared by a joint committee of the Council on Foods and Nutrition of the American Medical Association and of the Food and Nutrition Board of the National Research Council. There are eight charts showing the contribution that individual foods may make with respect to the needs for protein, calcium, iron, vitamin A, thiamine, riboflavin, nicotinic acid, and ascorbic

acid. A feature of these graphic presentations is that the values are presented in terms of the proportion of the daily requirements which are supplied by typical servings of each food. The requirements selected are the Recommended Daily Allowances of the Food and Nutrition Board of the National Research Council. The charts show, for example, that a serving of about 3½ ounces of cooked greens (beet, kale, chard, mustrd, spinach, turnip) will supply more than 10,000 International units of provitamin A, the daily allowance of which is 5,000 International units. An orange of average size, or half a grapefruit, or a serving of fresh strawberries will supply the 75 milligrams of ascorbic acid which is considered to be a desirable intake of vitamin C. It is interesting to note the unique value of milk as a source of calcium, protein and riboflavin. There is a descriptive paragraph or two about each of the charts. In addition the booklet reproduces the table of Recommended Dietary Allowances and also provides the values of Minimum Dietary Requirements developed by the Food and Drug Administration for purposes of labeling special dietary foods. This little essay thus provides considerable factual information about foods as sources of the dietary essentials.

SURGERY OF THE AMBULATORY PATIENT. L. Kraer Ferguson. Section on Fractures by Louis Kaplin. 923 pages. Illus. Price \$10.00. Philadelphia: Lippincott, 1942.

This book is well written, concise, practical and contains a very excellent chapter on anesthesia. It will be invaluable for the physician who does minor surgery in the office and for interns, but is valuable for any practicing physician.

FOR NERVOUS DISORDERS
Operated In Connection
with
Homewood Hospital

Plymouth at Penn Avenue, Minneapolis

The leading psychiatrists of the country agree on one fact, the first essential in the treatment of any nervous disorder is isolation. The preferable way to attain this end is proper hospital construction. The cottage style of hospitalization is the latest in the treatment of these patients. In our new arrangement, we are providing just this type of accommodation. We have six distinct units to accommodate all types of patients, large acreage of elevated, beautiful lands surrounded by parks, lakes and woods. Our nurses training school furnishes the best in psychiatric nursing service.

A nonprofit organization open to the medical profession.
